

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

WARD'S MISCELLANY:

UNDER THE SUPERINTENDENCE OF A SOCIETY

FOR THE ADVANCEMENT OF

LITERATURE, SCIENCE, AND RELIGION.

VOLUME I.

LONDON:

THOMAS WARD AND CO., 27, PATERNOSTER-ROW;

AINSWORTH AND SONS, 107, GREAT ANCOATS-STREET, MANCHESTER; AND AT 118, NEW SCOTLAND-ROAD,
LIVERPOOL; 76, NORTHGATE, BLACKBURN; ALSO AT THEIR HOUSES IN LEEDS AND BIRMINGHAM;
AND ALL INTERMEDIATE TOWNS.

MDCCCXXXVII.

**WILLIAM TYLER,
PRINTER,
BOLT-COURT, FLEET STREET.**

PREFACE.

COURTESY demands a Preface to every work, if it should consist of no more than the Author's or Editor's "*Ave, atque, vale;*" but the conductors of **WARD'S MISCELLANY**, having brought its first volume to a close, and made preparations for the commencement of a second, feel that not only courtesy, but gratitude for their past, and a becoming solicitude for their future success, call upon them to acknowledge the public favour they have already received, and to state the grounds on which they confidently hope to deserve and to enjoy a still more extended patronage.

They continue to adhere to the three principal divisions under which have been ranged the miscellaneous contributions of the present volume; namely, Literature, Science, and Religion. In each department it will be their constant aim to blend the pleasant with the instructive, the entertaining with the useful; the flowers and fruits of their literature will not be tarnished nor mildewed by licentiousness; their science will be free from the corrupting taint of scepticism and infidelity; their religion will breathe an universal charity in union with an uncompromising faith, and a blameless and devout morality. What they have addressed to the public, as descriptive of their labours during the past year, they will endeavour fully to realise in the future. "We have written for the public, not for a section of it; and while endeavouring to amuse and improve all readers in turn, we have been very solicitous to give offence to none. We have sought to be entertaining, without violating morality and decorum; grave, without tediousness; and moral, without austerity; to impart useful knowledge, unencumbered by crabbéd technicalities; inculcate great principles, irrespective of party bias; and to diffuse the all-important truths of revelation, divested of controverted tenets."

WARD'S MISCELLANY will henceforth be recognised as a "Family Magazine." This would have been its appropriate title from the beginning; for to interest and instruct the domestic circle, was originally in the contemplation of the gentlemen to whose management it was intrusted. This, then, will constitute a leading object, a distinguishing feature of the

work in its future progress ; and in prosecuting their task, the editors confidently anticipate the co-operation of the wise and good. They dedicate it more especially to the rising generation in families professedly religious, with a view of forming their intellectual tastes and moral habits ; for they are persuaded that there is no necessary connexion between ignorance and devotion, between mental degradation and elevated piety ; they feel assured that the attempt, when judiciously and perseveringly made, to unite the refinements of intellectual culture with the pure elements of revealed religion, is neither Utopian nor fallacious.

WARD'S MISCELLANY

OF LITERATURE, SCIENCE, AND RELIGION.

PROSPECTUS.

"THEMISTOCLES, when an ambassador in a set speech had boasted great matters of a small village, takes him up thus; Friend, your words would require a City." So anxious are the Editors of *Ward's Miscellany* to avoid the charge of uttering a prospectus which would require a Cyclopædia, that they could be content with referring the reader to the prospectuses of preceding periodicals, and simply adding, "all that they have said, we will do."

But this, of course, their modesty forbids; besides which, they deem it incumbent on every party commencing a periodical, to show, first, that such a publication is wanting; and, secondly, that the one proposed will infallibly supply the want.

As to the former of these duties, the merest tyro in literature is aware that where there is a disposition to publish, to prove the need of the publication is the easiest part of the task. The word *desideratum* appears to have been sent into the world expressly for such occasions, and the author is grateful for it accordingly. He feels that proof of the desirableness of his project is superfluous, and takes it for granted that every one will intuitively perceive it, and instantly acknowledge it. Should he, however, condescend to prove its necessity, the proof is so conclusive, that one only wonders at the folly of the world in not calling for his publication before: the want is felt to be so crying, that one is constrained to be thankful that society has held together so long without his desideratum; and fearful, like persons awaiting the arrival of a doctor in a case of life and death, lest the social system should dissolve before the expected help arrives.

Now, although the Projectors of the present publication indulge the hope that the British nation might possibly hold out a few years longer even without the aid they proffer, still they would not incur the fearful responsibility of allowing this question to remain doubtful even another moment.

The ground which they propose to occupy is virgin soil. They have not to give any of their fellow-labourers "warning to quit;" or, like the candidate for sovereignty in certain barbarous states in South America, to prove their qualifications for the throne by butchering the present occupant; nor, like oriental despots, do they deem it impossible to reign, unless the first act of their sovereignty be to massacre all their brethren. Far more congenial with their taste would it be to dwell on the distinguishing excellencies of contemporary periodicals, (and they

are not a few,) which are running a useful career, and enjoying a merited reputation;—to expatiate on the philosophy which enriches one—the spirit of nature which breathes through another—the useful information which distinguishes a third—the amusing character of a fourth—and the religious tone which pervades a fifth. But it is more accordant with their present duty to state, that it will be their aim to unite all these characteristic excellencies; and to add to them a sixth, of which the reader has at present no more conception than he has of a sixth sense, an excellency which must be exemplified in order to be understood.

Now they confidently appeal to the reader that no such Periodical exists; and they ask him frankly whether he would not like to read such an one—one which shall create an appetite for all the others, and yet render them all unnecessary—which shall constitute the *ne plus ultra*, the Hercules' pillars of periodical literature—which shall disprove the *Nihil novi super terram*—which, if Plutarch were *super terram* to write lives of periodicals by parallels, as he has of men, would compel him to throw down his pen in despair, acknowledging that "none but itself can be its parallel,"—which shall make the reign of William the Fourth as celebrated as the Augustan or Elizabethan age, and constrain the present generation to be grateful that their lot is cast amidst the light of its pages.

Having thus satisfactorily demonstrated that a new periodical is wanted, it only remains for us to show that the one projected will certainly supply that want. This might be done by simply enumerating the names of the writers embarked in it, and with whom it has originated. But, as these must remain sacred to secrecy, nothing is left us but to specify some of its peculiar merits. Let the reader recall to mind all the school prospectuses which ever passed through his hands,—promising the fond parent to make Solomons of all his sons, and Graces of all his daughters,—the *Miscellany* will aim, if not to afford the rising race an excellent "education in all its branches," to create a thirst for knowledge where, as yet, it is not felt, and to gratify that appetite where it exists already. Let him remember all the advertisements and prospectuses of rail-road speculations, which of late have passed under his eye—so many, that had they been as rife in the early days of phrenology, Gall would doubtless have found an organ of railroadiveness in the universal human cranium—the

Miscellany proposes to be a rail-road in the march of intellect, facilitating mental intercourse, uniting ease and safety, annihilating party distance, and, if not directly increasing the "filthy lucre" of those availing themselves of it, at least teaching them how to employ what they possess already. Let him think of that most interesting class of prospectuses, so provocative to appetite, vulgarly denominated *bills of fare*—and what document has he ever devoured with greater zest?—the *Miscellany* proposes to set before him a sumptuous repast of nutritious aliment, "including all the delicacies of the season," and never disappointing his hungry expectation with a "Not ready, Sir." Let him think of all the addresses "to the Afflicted and Distressed," and of all the "Balsams," "Heal-Alls," and "Universal Medicines," which have come under his notice,—the *Miscellany* is a gentle Alternative—warranted Antibilious—a certain specific against drowsiness, languor, and depression of spirits. But, saith Bacon, "it were too long to go over the particular remedies which learning"—which, being interpreted, means the *Miscellany*—"doth minister to all the diseases of the mind, sometimes opening the obstructions, sometimes helping digestion, sometimes increasing appetite, sometimes healing the wounds and exulcerations thereof, and the like; and to conclude with that which hath *rationem totius*, which is, that it disposeth the constitution of the mind not to be fixed or settled in the defects thereof, but still to be capable and susceptible of growth and reformation." And as this medicine is prepared solely from the most innocent yet effective articles in the whole *Intelligentia Medica*, (not containing a grain of error,) it may be taken with perfect safety by persons of all ages, and in every climate. And, finally, let him tax his memory for all the literary prospectuses, and "conditions of publication," which he has read, and which have promised to melt down the world, and re-coin it anew, stamped with their respective sovereign impresses—the *Miscellany* diffidently proposes to realize all the pleasing visions which these literary frauds have ever excited. By uniting all that is new in science, useful in art, instructive in education, important in morals and manners, sublime and pathetic in poetry, amusing in original anecdotes, narratives, and miscellaneous subjects, interesting in literature, and divine in religion—by rendering its gravest discussions attractive, and its lightest articles subservient to the illustration of great principles—by combining *veritas, bonitas, et suavitas*—and by making it so cheap that poverty can purchase it, so portable that childhood can hold it, so respectable that opulence shall be proud of it, so clear and simple that ignorance shall understand it, and so comprehensive and copious of information, that it shall constitute in itself an independent and sufficient library—by doing all this, the *Miscellany*

proposes to place its readers not only abreast, but considerably in advance of the well-informed portions of society, to purify and improve the public taste, to raise the tone of the national character; in short, to hasten the return of the golden age.

The Editors feel that the undertaking is great, and every way worthy to rank among the wonders of the nineteenth century. But *nil desperandum*: "till a matter be done, men wonder that it can be done; and, as soon as it is done, wonder again that it was not sooner done; as we see in the expedition of Alexander into Asia; and the same happened to Columbus in the western navigation;" and the same, doubtless, will happen to them. On this account, far more congenial would it have been to the Editors could they have introduced the *Miscellany* to the public, as the gods were accustomed to descend among mortals, *in aurâ leni*, without noise or commotion. But fearful of the shock which its unheralded appearance might occasion to the "gentle public," and desirous to act towards their rivals in the magnanimous spirit of Alexander on the plains of Arbela, they "would not steal a victory," but thus announce their coming—desire a fair field, and no favour.

And let no one weep, like the ancient Thracians and modern Malthusians at the birth of a child, that another book is born into the world; for, saith a great authority, when speaking of the redundancy of books, "this surcharge is not to be remedied by making no more books, but by making more good books, which, as the serpent of Moses, might devour the serpents of the enchanters." That the *Miscellany* will have this effect, its Editors have no question—their only concern relates to the future support of those whose books are to be devoured. They would remind them, however, that if their individual welfare is sacrificed, it is to the general good—exhort them to be resigned—and promise that, for their sakes, they will treble their subscriptions to the Literary Fund. From the preceding statements, the reader will perceive the high opinion which the Editors entertain of prospectuses generally, as well as their determination not to be outdone in any department which may properly fall within their province; and he will also have the goodness to believe that they promise every thing, simply that they may consider themselves pledged to nothing.

Now, after this frank and friendly introduction to the reader, the Editors only deem it necessary to add, in sober sincerity, that it will be their aim to produce a Weekly *Miscellany* which shall possess characteristic excellencies distinguishing it from all its contemporaries, and that its pages will be consecrated to the highest and the holiest purposes. But in order to estimate its peculiar merits, they respectfully invite the reader to await its actual appearance.

RETROSPECT IN PROSPECTU.

"How like you our Prospectus?" "Not at all," say a certain demure class, who, lacking wit, imagine themselves profoundly wise. "A Prospectus of what? It is too long to be a joke, and yet too absurd to be the prelude to any thing serious; it must be a hoax." "Not so, most grave and reverend Signiors; this number is a substantial proof that it is, *bonâ fide*, a veritable Prospectus." "I cannot understand its drift, nor the object of the writer," says a worthy biblioplist in the Row, by no means a conjurer; "it sets all customary rules at defiance; it has no definite points to enable the trade to form the slightest conception of the nature of the publication it announces; we know it is '*Ward's Miscellany*,' and that is all." "And enough, Mr. Malapert; is not a Miscellany a Miscellany? and *Ward's Miscellany*! He that does not see a meaning and a mystery in this, can understand neither rhyme nor reason." "Ah!" groans the Rev. Pelagius Sleekhair, "its levity is my abomination." "Yes," rejoins the Rev. Hyper-Calvin Frybabe,* who lives in the garret of the house of which the worthy Pelagius occupies the ground floor, "on all other subjects I differ from you *toto cælo*, but on this we are agreed,—we must encourage no laughing philosophers; if we do not effectually root out the *gaieté de cœur* among our young people, and assiduously preserve them from its contamination, our churches will dwindle into nothing; there will be no generation to come after." "I am a religious conservative," says a Simon Pure-looking personage in black, "and your Prospectus—which, by the bye, is a strange misnomer—is too flippant, and too satirical to please my taste. I proscribe every literary effort that presumes to infringe upon the long-established order which unites dulness with piety. A Christian has no right to be facetious; above all, he must abnegate ironical pleasantry; nor is it for him to shoot folly as it flies. Your Prospectus, gentlemen, is not a Sermon." "We acknowledge it with all humility. We leave sermons to the preachers. Ours is a Miscellany; yet grave Sir, it is possible, in our endeavours to amuse and to instruct those who are willing to be pleased and ready to learn, that we may find

"Sermons in stones, tongues in trees,
Books in the running brooks, and good in every thing."

The religious spirit, we trust, will purify our thoughts, chasten our feelings, and guide our pens. Science, arts, and letters are the handmaids of religion. The wisest philosopher is he who deems the book of God the best; but he is a very mistaken Christian who would deprive religion of these her charmed attendants; and

* This is the same personage introduced to our notice in "*THE DOCTOR*," who has mistaken his christian or his given name, which is *Hyper* not *Philo*-Calvin.

who would confine his reading exclusively to the Holy Scriptures. We contend that there is not a particle of levity in the paper which has drawn so harsh a judgment from the Sleekhairs and the Frybabs of this generation; and we tell them that we regard religion with so high a reverence, that we even respect the prejudices of its injudicious advocates. Acknowledging this, we likewise add, that we must not, in deference to human weakness, consent to make religion a scarecrow. This sacred, though perhaps, an invisible element, as we have hinted, shall qualify our lightest articles; and its presence we will confess as Christians do, when in social life they indulge in the innocent pleasantries of their most unrestrained intercourse. We aim to be the companions of the breakfast-table, and an evening guest in those family circles where devotion hallows every domestic enjoyment; where religion presides, and fills the throne of cheerful and happy hearts. Neither is our philosophy nor our religion cynical. We know how to be grave and to be gay—meaning by gaiety what the wise man intended when he said, "A merry heart doeth good like a medicine." We are not strangers to deep-felt emotion, and we have our seasons of melancholy; but we know how to charm away the evil spirit: and we are taught by a philosophy not learned in the schools, that true wisdom breathes of consolation, and hope, and joy, but never of sadness, sourness, and cold misanthropy. The anxieties of doubt have sometimes knit the brow of thought almost into an expression of agony—but we have also been gladdened by the *Eureka* of discovery. We have now attained, in reference to the most momentous subject that can agitate the human mind, "the soul's calm sunshine and the heartfelt joy;" and on whatever theme we touch, we do it with buoyancy, and under the influence of pleasurable emotions derived from the highest source, which we are not disposed either to disguise or repress. The elegant pursuits of literature have refined our sense of the delicate and the beautiful, and the solid satisfactions of religion are the balm of our spirits. Messrs. Sleekhair and Frybabe, we bid you a very good even; may your dreams be as antibilious as your waking thoughts and feelings are sombre and acrimonious.

"I guess," says brother Jonathan, whose answer to our modest inquiry has just been wafted to us across the Atlantic, "that your Prospectus means more than meets the eye; it looks very like a sly attack on all your predecessors and contemporaries, while it but ill conceals your own egregious vanity. You abjure, indeed, all pretension in words, yet, though you directly promise nothing, do you not insinuate that you intend to do every thing? Is not your arrogance prodigious?"—Prodigious!

"Do you expect that a work so introduced will ever succeed?" is the inquiry of many who, in their affectionate good-will, earnestly desire that it may not. But *ecce signum!* Have we not great capabilities? And, should we fail—how many glorious attempts have perished in embryo? But we are already born into the world—look at our infant smiles, and you will not find it in your hearts willingly to let us die.

"It is mirthful," replies one of the million who have made up their minds to be our purchasers and patrons, "and it does me good; in a playful mood, and by a flowry path, it aims to allure us in good humour, and with a gentle spirit, into an intimate companionship with its forthcoming lucubrations." Thank you, dear reader; for you these pages are written, and they will not fail to impart to you both pleasure and instruction; with you we could hold converse from

"Morn to noon,
From noon to dewy eve,
A summer's day."

And you will find, as we proceed, that we have "Toys for the young and the old, as well for the grave as the gay," as sings, not Dr. Southey, but his predecessor, James Pye, Esq., Poet Laureate. But, before we begin, allow us to settle with you a few preliminaries. Science, Literature, and Religion!—What is there not embraced in these grand divisions? Let us, therefore, not be understood as holding forth any promise of an encyclopædia; nor are our readers to expect that the order of subjects, as it

stands in the Prospectus, will be strictly adhered to; or that each number will contain them all; or that we mean to be profound, in the heavy sense of the term, on any. This we leave to the mystifiers and the metaphysicians. We know there are things in heaven and earth that our philosophy has not dreamed of; but we shall fix no bounds to our inquiries. Science, as applied to art, and art as sustaining science—discoveries when they are made, and improvements as they advance, will find adequate notices in our page; and the treasures of literature—of the olden times, and of the passing hour—all that exalts sentiment and refines taste; whatever gives ardour to virtue, and confidence to truth, we shall produce for the benefit of that portion of the public that may feel interested in our labours, and willing to encourage them.

The devout and the wise of all churches and sects—those who, under whatever forms and distinctions, are sincerely anxious for the defence, the diffusion, and the influence of pure, practical Christianity, as embraced by Protestants of all persuasions, who regard the person of the Saviour as Divine, his death as a sacrifice, his life as an example, the Scriptures as his word, and the Holy Spirit as his witness and their interpreter, will do well to promote the circulation of a periodical, whose great object shall ever be to enrich and elevate, with all useful knowledge, those minds which are already imbued with that infinitely high and transcendental science—"The science which makes wise unto salvation."

HOME.

No term in language is so replete with delightful associations as the word "home;" the sound of it touches a vibrating chord in every human bosom; and he whose pulsation is not quickened by it, must have sunk into the last degree of moral insensibility. Whether we think of the spot, enshrined in memory's most hallowed recesses, where we drew the first breath of existence, or of the dwelling-place of maturer years, in the centre of a wide-spread scene of various relationships, occupations, and influences;—the home of infancy and of manhood is ever dear; and dearer still, perhaps, the home of age. Is there any heart that needs to be impressed, or any understanding that requires to have the sentiment inculcated and enforced, that there is a charm in the words "parent," "father," "mother," "brother," "sister," "husband," "wife," and "child?" Surely there is none. Even instinct here is stronger and more perfect than philosophy; it is, besides, more universal, and operates as a settled law of the moral universe. To it are to be referred many of the purest sentiments and passions of which our nature is susceptible; and from it are derived some of its choicest sensibilities.

It matters not *where* that concentration of all sweet remembrances called "home" is fixed; the mind is spell-bound by the thought. It may be in the midst of Africa's burning sands, or amongst the ices of the pole; it may be in the haunts of barbarism, or the refinements of civilization; it may be in the crowded city, or rustic village; on the mountain's top, or in the lowly vale; still it is *home*—the best of fancy's images, the richest of reality's enjoyments. Nothing, in fact, is more wonderful or cheering to contemplate, than the total independence of this one great possession of every other, and of all external circumstances. For, to render it happy, it need not be invested with dignity, or encompassed by magnificence. It may be the retreat of poverty itself, and yet be capable of ministering to some of the noblest pleasures of the mind; and its untutored, unadorned, and unknown inmates will not fail to produce affecting and endearing emotions, which flow through the whole extensive circle of consanguinity and friendship. Nor does it signify whither we ourselves may have wandered; for still the same beloved image presents itself, with its associate ideas, to banish distance in separation, to create company in soli-

tude, to inspire joy in sorrow. We may visit lands more fertile, societies more refined, and abodes more splendid ; but *home* surpasses them all.

If the picture we have now briefly, but not too poetically drawn, possess any of the characteristics of truth, there cannot be a more melancholy display of human destitution than a being *without a home*,—a houseless, bewildered, and hopeless wanderer. To complete the vision of this wretchedness, it is only needful to conceive of a person banished from his dwelling, not by misfortune only, but by the disastrous and desolating power of crime ;—to suppose that this has stripped him of his possessions, broken the last tie of his earliest and most privileged associations, and driven him into a wild region of separation from the love, as well as from the accommodations, of his own or his father's habitation. This is, with a few additional circumstances of surpassing interest, the Saviour's parable of the prodigal son. A man had two sons ; the younger demanded his patrimony ; he departed from his father's house into a distant country, where he dissipated all he possessed in riotous living ; and, after reducing himself to the extremity of want, a famine occurred, and he let himself as a swineherd, with scarcely the means of obtaining a meal. Reflection brought to view his folly, and the abundance of his father's house. He determined to return home, confess his wickedness, and implore even a menial situation in his parent's establishment. He did so : his compassionate father welcomed him with tears of joy, and made a great festival to celebrate his restoration. Whatever other truths this parable may be intended to represent, unquestionably it conveys a striking idea of the folly and guilt of every man in wandering from God, and the felicity of a full reconciliation, a perfect love, and an eternal home, which await the penitent and the believer.

Notwithstanding the accommodations, the affections, the pleasurable intercourse, and the numerous advantages belonging to the best-regulated families, this earth can nowhere furnish the Christian with his most valued, permanent, and only real home ; no, not even where science, literature, and art have done their utmost to elevate intellect and embellish life ; not even where love presides over and pervades, with its sweet charities and sacred bonds, the domestic circle ; not even in the present imperfect condition of our being, where religion itself prevails, though it only can impart the finishing excellence to character, and spread a moral sunshine over the darkest lot of humanity. The Christian's home is in "a better country,"—a mansion in the skies. As it is neither situated in a world of vicissitudes, nor constructed of earthly materials, it possesses none of those characteristics of imperfection and decay that are incident to every state and every

profession below the sun. Who is there that has revisited, after some years of absence, the place of his nativity, without emotions of sorrow at the changes that have occurred ? The children of another generation are sporting on the village-green where his careless infancy gambolled, or are strolling over the green fields, or tossing the stones, or their fish-hooks, into the stream that flows through the paradise of his juvenile delight ; the very tree which shaded the green that formed the greatest province of his earth, has lost some of its noblest branches, and shows a more hollowed and time-worn trunk ; and the cottage, with its pretty little garden and white-painted pale fence, is inhabited by others than his parents and his family circle—a new and unknown race—or is desolate, and fallen into the wreck of years ; his little shag dog, his favourite cat, his chosen companion in the school and in the holiday-hours, of sport and birds'-nesting ; the ever-laughed-at, ever-loved humorist and polyphemus of the hamlet,—all, all are gone. But there are no changes and desolations in friends or things in our heavenly home. Who is there that has not found, in the best ordered and most united families, some sources of disquiet, misunderstanding, and painful regret ; and who, in the most prosperous, has not realized the uncertainties, and witnessed some of the distressing events, or depressing anxieties of life ? But neither misrule, nor mistake, nor care ; neither mutual dissatisfactions, nor wide-wasting adversity, are incident to our Father's house in the heavens. Who that has witnessed or enjoyed the rosiest health and the brightest prospects, but has suffered from the inroads of disease, the distractions of grief, and the separations of bereavement ? But these calamities, which have their origin in man's fall and degeneracy, depart for ever from that sinless, sorrowless, and deathless abode which constitutes the Christian's home.

In traversing the vale of life, I saw an aged man sitting, as if in profound meditation, beneath the overshadowing branches of an oak. I approached respectfully, and said, "My friend, you seem solitary and sad."

"Not so," was his reply ; "I am neither solitary nor sad."

I looked round with an air, doubtless, of wonderment and unbelief, for it attracted his notice, and led to further discourse. I could see no living thing, neither bird, nor beast, nor insect ; the only sights that presented themselves to the eye were an impenetrable forest skirting the narrow slip of land between mountains, a narrow streamlet gliding down the centre, and a hut without inhabitant, near which the hoary-headed pilgrim had taken his station ; and the only sound I heard was the bubbling of the brook, which seemed to create a deeper silence.

"Not solitary ?" I asked.

"Stranger," continued he, "have you never

heard or felt that one may be never less alone than when alone? These sylvan shades, and this conscious heart, touched by a renewing power, bespeak an ever-present Deity; and who can be alone when God is with him?"

"But may I be allowed, without offence or implied suspicion, to remark, that a romantic sentiment of this nature has been often uttered by those who have evinced no real knowledge of the infinite Being, no acquaintance with his moral character, and their relation to him, and none of the devout affection which breathes in the hallowed strains of Israel's pious monarch: 'As the heart panteth after the water-brooks, so panteth my soul after thee, O God.'"

"I know," said he, "the sentiment is often romantic, but with me it is real. I hold converse with the Highest, not as the God of nature only, but as the God of Scripture; not as the Creator of heaven and earth only, but as the Redeemer of lost man, through the shedding of the blood of 'the Lamb slain from before the foundation of the world.'"

"Then you receive that doctrine which is often termed, in scorn, *evangelical*?"

"Assuredly; that great elementary truth is all my salvation and joy,—'the blood of Jesus Christ his Son cleanseth from all sin.' Whoever chooses to mock at or neglect it, must take the fearful consequences of his derision and infidelity."

"Christian pilgrim, I hail your venerable age, but more venerable experience. You are not, then, solitary; and I perceive you cannot be *sad*."

"As to the latter, my worthy visitor, there is enough in my temporal lot to produce the wretchedness I nevertheless disclaimed. Ah! sir, my life, like this wide-spreading tree in its wintry desolation, has no greenness; but unlike it, and more despoiled by time, I have no branches left."

"Then you have lost a family?"

"I have lost parents, kinsmen, wife, and children, the beloved companions of earlier days; and I have lost property bequeathed, and property acquired, all but my last shelter, that wind-shaken hut; and yet I have an inheritance, too, and am going to take possession."

He lifted up his eyes, and pointed his fingers; both appeared in the direction of the lofty mountains.

"You have an estate, then, beyond those hills, and your personal presence is necessary? But can you hope, under the pressure of so much age and infirmity, to surmount those barriers of nature; and will you spend your last strength in so vain a toil, and to acquire so transient a possession?"

"It is not those mountains," he exclaimed with energy, "which I expect to pass over; nor is it a valuable property lying beyond them, in some

fair enclosure, which I seek to secure, or which I know to be mine."

He paused, and pointed upward once more; I saw it was to the "everlasting hills," and to his anticipated possession in heaven. He added, with inexpressible emotion, "My weary pilgrimage is ended, and I am just **AT HOME**."

It is the gospel of Jesus Christ which unveils the mystery of future existence; it is *himself*, as "the light of the world," who "brings life and immortality to light." If it be a fact, fully attested and unquestionable, that there is a condition of endless and blissful existence for the Christian, it is not only important to inquire what is heaven, but chiefly important is it to ascertain the way to it; what is a Christian; and what is the foundation of personal hope with regard to the possession of its immeasurable joys? To this point we shall devote a few lines, because, amidst the diversities of religious sentiment which obtain, and which in some cases are extreme and essential, we choose, in the first number of our publication, to assure our readers that in Christianity we take our standing at once, without hesitation and without compromise, on the only ground where we conceive firm footing is to be obtained,—the atoning efficacy of the great Sacrifice, the redeeming and saving power, through faith, of the death, the resurrection, and advocacy of Jesus, the Son of God. The Scriptures represent the object of our Saviour's incarnation to have been, "to take away sin by the sacrifice of himself;" or, in other and diversified modes of expression, to "save men's lives;" "to save sinners;" "to seek and to save that which was lost;" "to take away the sins of the world." Whatever be the phraseology, the essential idea is always deliverance from destruction,—the removal of a curse,—salvation from ruin, and restoration to God and happiness, in the dispensation of a present pardon and a future heaven. It is uniformly declared that Jesus Christ succeeded in his purpose,—that he made an atonement which satisfied every claim, and presented the basis of a perfect and everlasting reconciliation between the alienated transgressor and his offended Maker. The *appropriation* of this covenanted provision, so that salvation may be actually enjoyed, is uniformly attributed to faith or believing in Christ: "Therefore, being justified by faith, we have peace with God, through our Lord Jesus Christ." The apostles, with undaunted heroism and persevering zeal, amidst the world's mockery of a doctrine too simple, spiritual, and self-humiliating for its approval, went every where proclaiming its truth, and attesting their own convictions of its importance, by labouring with incessant effort, and suffering martyrdom with readiness and even joy, for its diffusion. Faith forms the Christian character, and, through the sanctifying power of the Spirit, prepares for heaven, the Christian's home. Jesus Christ was not a martyr, that is, not a martyr only, he was

a substitute, a sacrifice, a propitiation, "descending from above,"—as angel messengers announced to the shepherds of Bethlehem "keeping watch

over their flocks by night,"—to promote glory to God in the highest, peace on earth, and goodwill to men." Y.

THE STUDY OF NATURE.

THE book of nature is so superior to every book of human contrivance and composition, that it is impossible to institute any comparison between them. When we wish to be instructed by the human book, we must perform two distinct species of labour,—we must know the language in which the book is written, before we can ever attempt to obtain the slightest idea of the information that it contains, or whether it contains any information which can be profitable or pleasurable to us. But when we go to the book of nature, one-half, and that by far the most disagreeable and difficult half, of that labour is spared us. In the book of nature the acquiring of the knowledge itself is the very first step in our progress, for nature's book is written in every language and dialect under the canopy of heaven.

It is this facility in acquiring the knowledge of nature which constitutes the grand charm of nature's works; and the human body and mind are both so adapted to this, that the contemplation of nature is not only required, but absolutely demanded, for the keeping of both in their proper tone. There are many powers of the body, and many faculties of the mind, which seldom or never come into play in our ordinary avocations, especially if those avocations are mechanical; and this is the case, to a greater or less extent, in every occupation which mankind follow, or can follow, as a trade.

Now, whatever power or faculty is allowed to lie idle, does mischief both to the body and to the mind. In the body we can observe it; and there is not a single mechanic that has been long and industriously employed at one trade, whose walk, and, indeed, whose whole air and gait, instantly tell what trade he is of, without any inquiry. The reason of this is, that each trade requires a different application of the muscles, or moving powers of the body; and those which are not exercised in trade or occupation become weakened, while the ones that are exercised are thereby strengthened, provided the exercise is kept within reasonable bounds. The necessary consequence of this is, that the body gets deformed, not, most probably, to such an extent as that the parts of it seem disproportioned and out of shape when it is in a position of rest; but the moment that it is put into what may be called the natural motion of the human body, namely, walking at ease, the deformity tells in the gait, as has been mentioned.

To prevent this, it becomes necessary that those who labour in any particular way which requires more of the work of some muscles of

the body than of that of others, should have regular periods, not of mere rest from labour, but of what is properly termed relaxation; that is, allowing those parts of the frame, which are in a state of tension during the working hours to unbend themselves, while others come into action, and supply their place.

To preserve this mechanical tone of our animal frame in the best condition, and for the greatest length of time, experience clearly shows that mere rest is not that which it requires to alternate with labour, but that there is a certain portion of the frame which demands exercise, before the whole machine will so work as to keep up the tone and vigour of those parts of it which we use in our every-day occupations. So well is this understood, that those professions or trades which have nothing but a continuous alternation of labour and repose, always weaken the bodies and shorten the lives of those engaged in them. It would be invidious to instance any particular trade; but there are some required and largely exercised by the luxurious state of the country, where the arm of one sturdy yeoman from the valley, or one mountaineer from the hill, would scatter hundreds of the feeble things like chaff.

In this case it is really a return to nature which upholds the working structure of the body against the inroad which art is every day making upon it; for the relaxation which tends to soundness of the constitution and the fabric, is a natural motion which brings every part of the body into play. Those who have been labour-worn, or care-worn, or study-worn, till nature was sick and exhausted, even to the desire of death, and who, when in this state, have taken a well-informed friend by the arm, and moved toward some open common or some wind-beaten hill, must have felt how the sinews began to knit, and the muscles to swell, as the breeze of heaven played around their free motions; and those very feet which tottered at leaving the threshold, shall have returned to it bounding as the roe.

But if there is such medicine in the merely natural action of the body, without any reference to a single subject of thought, what glorious healing must there be when the immortal spirit is brought forward, and all nature is set before it! The body, curious as it is in its structure, and numerous as are its parts, is a mere temporary accommodation, a thing of threescore and ten weary winters, and then to rot in the earth; it is, as it were, the mere chariot in the course of life, which the mind rides and governs; and therefore, if we are to improve man as man, and not as beast, the mental improvement must be the

grand and primary subject of our attention. We do not mean the parade of technical learning, for of all kinds of ignorance that is often the most offensive; but we mean a mind that is able to stand up and to master every subject which may come before it.

How is such a state of mind to be obtained? We answer, In a manner similar to that in which

a healthy tone of the body is preserved. Let the mind have its relaxation, so that all its faculties may be brought into play, and then the narrow thought of the exclusively devoted to one thing will be shaken off, and the mind will be equally ready and able. The study of nature is the mind's relaxation; but in what manner it is so, we must say on another occasion. THERON.

A SEASONABLE THOUGHT.

Tempus fugit,—"time flies,"—a truth which the New Year proclaims, and which may be placed in a mathematical light. The sun is stationary in the heavens; the earth moves around it at the amazing rate of about 50,000 miles an hour; travelling a circle of millions of miles a year. Now *that* is literally the flight of time; the speed of human life; for it is the revolutions of the earth that measure our time.

"The days of our years," says the Psalmist, "are threescore years and ten;" not that we can calculate on so many, but as few attain to that age, and still fewer go beyond it, he took *that* as the maximum term of human life. Now suppose you were to be placed in a vehicle, and to be assured that you should live only till it had moved round a certain space so many times; you would at once feel that in that case the length of your life depended, not so much on the space which the vehicle had to go over, as on the rapidity with which it moved—the faster it went over the allotted ground, the sooner your life would end. And oh! if you loved life, if you dreaded death, how much would you grudge every inch of ground you passed over! You would deem its slowest pace too fast.

Now this is, substantially, the predicament in which you *do* stand. The earth on which you live is the vehicle; and you are assured that when it has carried you round the sun a certain

number of times, your life shall end. Do you not feel anxious, then, to know the rate at which you are moving on this journey of life? and when you are told that you are accomplishing it at the rate of so many thousand miles an hour, may you not well exclaim with the patriarch, "My days are swifter than a courier, they flee away!" You can actually calculate how much ground you have gone over. Multiply the rate at which the earth travels annually by the number of years you have lived, and you will see how far you have already travelled. You will find that whether you have been sleeping or waking, thoughtful or inconsiderate, you have been always rushing towards the goal of life—drawing nearer to it by thousands of miles every hour—so that however vast the space you had to travel over at first, it is daily, hourly diminishing, at a rate which will soon bring you to your journey's end.

Vita brevis,—"life is short." Hippocrates, who was probably the author of this apophthegm, extends it further, adding, *et ars longa*; intimating that the longest life is only sufficient to enable us to acquire a moderate acquaintance with any art or science. The Christian knows, however, that it is long enough to acquire the art of living well—the science of happiness; and he who has acquired *that*, bids fair to add an inch to his span-long life.

ON THE LEARNING OF THE IGNORANT.

~~There~~ may be science in fools, as well as fools in science; a sentiment which, were it not for the stupidity of mankind in general, would be seen to be axiomatically true. In fact, it is sometimes really vexatious and depressing to observe how the sagacity of an ignorant man throws a kind of reproach upon the toils and accumulated treasures of the weary and worn-out student; so that knowledge which smells of the field, and is a kind of wild flower in nature's garden, is more fragrant and refreshing than that which smells of the lamp.

But, before proceeding further, it may be as well, and will certainly be honest, though at the risk of forfeiting the honour of originality, to confess that the subject of this paper has been suggested by an essay of Hazlitt, a writer who

is often both clever and comical. It is entitled, "On the Ignorance of the Learned;" and is sufficiently illustrative of its motto, which is selected from Butler, and is, on many accounts, for its own sake, as well as for its applicability, conversely, to our present design, worthy of being here re-quoted.

"For the more languages a man can speak,
His talent has but sprung the greater leak;
And, for the industry he has spent upon't,
Must full as much some other way discount.
The Hebrew, Chaldic, and the Syriac,
Do, like their letters, set men's reason back,
And turn their wits that strive to understand it,
(Like those that write the characters) left-handed.
Yet he that is but able to express
No sense at all in several languages,
Will pass for learner than he that's known
To speak the strongest reason in his own."

Mr. Hazlitt, however, does not quite satisfy us in some particulars, unless we take his statements as sarcastical. He describes learning to be "that which is not generally known to others, and which we can only derive, at second-hand, from books or other artificial sources. The knowledge of that which is before us, or about us, which appeals to our experience, passions, and pursuits, to the bosoms and businesses of men, is not learning. Learning is the knowledge of that which none but the learned know. He is the most learned man who knows the most of what is furthest removed from common life and actual observation, that is, of the least practical utility, and least liable to be brought to the test of experience, and that, having been handed down through the greatest number of intermediate stages, is the most full of uncertainty, difficulties, and contradictions. It is seeing with the eyes of others, hearing with their ears, and pinning our faith on their understandings." This very well discriminates between learning and wisdom,—between the mere accumulations of knowledge, and their practical application and use. Hazlitt was thinking, however, only of *book-learning*; but we must be allowed a more latitudinarian signification in the use of the term; and it will then appear that if the learned are often ignorant, the ignorant, too, are learned. Whose experience does not testify that if in travelling with a learned man he may hear ignorant and stupid remarks, in travelling with an ignorant man he will be frequently confounded by wise ones? for the one draws from books, or if from his own mental resources, from a well muddy or without water; the other from the pure and perennial springs of sound judgment within. The one is like a fish-pond in a well-shaven lawn; the other like a sweet fountain covered over with weeds and thorn bushes.

The learning of the ignorant is in reality of two kinds—namely, that which is derived from tradition, and that which arises from a knowledge of human nature, or natural sagacity; the former is often replete with wisdom, the latter with wit, and with views that are profound, without the name of philosophy. By traditionary knowledge we mean the shrewd axioms of our ancestors, which are frequently found to pervade the lower classes of society, and to be treasured up in the simplest minds; and we have been struck a thousand times with the character of that knowledge. The very things which are thought to be ridiculous, and denounced as old wives' fables—the very quintessence of absurdity—the distillation of our forefathers' credulity or jokes, are nevertheless nothing more nor otherwise than concentrated good sense, and the fruits of continual and careful observation. From this cause, the most ignorant people have been greater philosophers than philosophers themselves, and have understood as much, or more,

about the influences of the moon, on wind and weather, and other kindred topics of acoustics and meteorology, as the most accomplished scientific lunatics. Common adages or maxims are admirable, and sometimes deserve to be received as infallible. Take, for example, the following plain-spoken fact—"Lend your money to your friend—lose your money and your friend." Who that has had any experience of the world, but knows that, in ninety-nine cases out of a hundred, this is literally and glaringly the fact? The hazardous experiment has been made over and over again with better hopes and self-deceiving expectations, and the result has been repeatedly, and almost invariably, the same. Distrust in young minds, like confidence in old ones, is of slow growth, and can scarcely ever be inspired by argument, appeal, and historic demonstration. Do what you will, you cannot, according to another sage observation, "put old heads on young shoulders;" life is too new, too promising, too brilliant, to admit of it. And here again, the axiom, "There is no royal road to knowledge," may be applied to moral discoveries. If diligence, study, and perseverance be requisite to the attainment of science or literature, an application of the same mental process is essential to the development, or rather to the belief, of great fundamental truths in the history of man. Experience is to acquisition in moral science what grammars and lexicons are in the attainment of a language: in both it is the law of our mental economy to "make haste slowly."

The other species of learning to which we referred, natural sagacity, is that which often supplies the place of *learning*, in the ordinary acceptance of the term. No one can fail of having been amused and surprised at the shrewdness of some unlearned persons. They are prompted both to say and to do certain things in a way that bespeaks innate powers of a high order, which, amidst outward concealments or accidents, evince all the attributes of native genius. And as to the discoveries of untaught men, they are great and striking. Think of a poor boy discovering the telescope! Think of Pascal discovering the series of Euclid's propositions in the first book in his father's garret! Think of Opie discovering and pursuing the art of painting in a saw-pit! Think of Bloomfield writing his poem of "The Farmer's Boy" when he was what he describes in Suffolk, and when he could not spell rightly a word he wrote!

In the commonest walks of life, how often do we find science without knowing it—both theoretical and practical. A mathematician sits down to demonstrate that the two sides of a triangle are together greater than the third side; whereas, without any of the diagrams, and ABC's, and *quod erat demonstrandum* of Euclid, a poor man knows by experience that the strait path from one gate to another is, as he calls it, a

shorter cut than to go by the sides of the field, which are at angles with each other. A learned philosopher will explain very *optically* and very logically the subject of refraction. He states that the rays of light, in passing through different media, as air and water, are diverted from their rectilinear direction, and occasion the objects of vision to be seen in other than their actual places and positions. When the rays pass from the rarer into the denser mediums, they are drawn nearer the perpendicular; but when they proceed from the denser medium into the rarer, they move in a direction further from it. In illustration of his reasoning, he takes a basin, places a shilling on the bottom, securing it by sealing-wax from shifting its position, and then pours in some water. You are required previously to retire, so as just to lose sight of the piece of money from the edge of the basin, and as the water flows in, it is perceived to rise into full view. This, he tells you truly, is owing to the refractory medium, the water; and a pretty experiment it is for juvenile philosophers. But the rustic villager has it all before him in another form, and with the practical application of the theory. He takes his gun, or the gun of his master, to shoot a large species of fish, which he sometimes snares; but instead of aiming directly at it, he has learned to calculate upon the power of the refracting medium, and levels his piece so as to allow for it. The indirect aim secures his object, because he knows that the bullet is diverted from its immediate course, like the rays of light, by the water through which it has to pass. The history of *natural arithmeticians*, if the expression may be used, is remarkable. The means of acquiring their untaught knowledge have in some instances been developed—in others it has remained an impenetrable secret; and

what is curious, they have never been found capable of explaining it themselves. Thus, in the case of a girl at Bethnal-green, in the east of London, she stated that the first tendency in her own mind to numbers and calculations was discovered by continually detecting herself in counting the threads in her loom as she wove them. Her mind accompanied her shuttle, till she reckoned them with the interstices cross-ways, and in every form of possible or imaginary position. From addition she proceeded to multiplication, but then lost herself in the wilderness of an extensive domain of thought, which she could traverse, though she knew not how, with the utmost facility. The Devonshire boy was still more extraordinary: he could answer at once, or in the shortest time which can well be imagined for such a work, the most difficult questions proposed to him by expert calculators. Many have employed hours to prepare sums which he could give with perfect accuracy in a few minutes; but neither could he explain them, nor afterwards, although instructed for the purpose, the method of arriving at his solutions. The faculty was at first discovered in a singular way. Two butchers were disputing about the price of a hog which one had sold to the other. They reckoned so many stone at such a price; but the odd money, or fractional results, surpassed their arithmetic. The boy in question was playing with some little schoolfellows of his own age at marbles, seemingly taking no notice; but at length burst forth with a kind of triumphant laugh at their stupidity, and told them the exact amount. They were at first indignant at his impertinence, but at last yielded to his knowledge; and the circumstance becoming the talk of the village led to the further discoveries of his surprising talent.

X.

STORY OF A LEAF.

"Upon what subject shall I write?" thought I with myself; but the visions had fled, and all was a blank to me. I called, but not one of the countless millions of things, real or imagined, would stand up and give me the likeness thereof. "I gnawed my pen, then dashed it on the ground, sinking"—but, alas! not "from thought to thought;" for it was descent in sheer mental vacancy, as silent and as actionless as that of the down of a feather when it drops, heavily as lead, through the altitude of an exhausted receiver in an air-pump.

I tried the three resources recommended by the matchless Stagyrte who taught the Macedonian youth to conquer the world, in order that he might impart, if possible, the learning of Greece to the people, and send, in return, specimens of the productions of all lands for the benefit of the philosopher-students at Athens.

As he directs, I looked upon the ground to see what memorial of the past would come to my assistance; but the waters of oblivion had passed over it, and not a vestige presented itself. Again I looked upward to the sky, in fond anticipation of the fore-cast shadow of some coming event; but, alas! the seal of secrecy was upon the whole, and would not be broken. I looked straight forward along the level line, in hopes to discern something of the passing day; but the day, too, was subjectless and silent. Thus was I compelled to abandon all the three resources of Aristotle.

Then I tried my usual sources of reminiscence,—the corners of the room,—the books in or out of place,—the coal-skuttle turned the right way or the wrong,—and all those little artificial helps which I had aforetime found so redolent in ideas; I even dared to cast a glance upon

that sacred cobweb in the corner, the contemplation of which had aforetime enabled me to solve, in so satisfactory a manner, the knotty problem as to whether an angle can pass through empty space, and solid iron, with equal rapidity and absence of fatigue. The cobweb enabled me to say, "Yes," in the case of the angles; and I would maintain it sturdily to this day against the whole host of the Jesuits, and the convocations of Cam and Isis to boot; but on the present occasion the cobweb was as mute of information as the spider which constructed it; which spider must have gone the way of all spiders more than twelve months ago. I was thus reduced to an extremity. The pens, the ink, the paper were all ready, and there was a willing mind; but not a subject would present itself by means of which I could enter the lists of immortal fame upon the arena of "WARD'S MISCELLANY." I went into the garden in despair; a branch of a Maddock's cherry-tree extended across the walk, and there was pendent from it a single withered leaf, the last remnant of that foliage which had been so gay and green upon it in the season of the year's beauty. Just as I approached it, it dropped down, not by the agitation of the wind, for there was not a breath stirring; but by the gentle law of nature's all-bountiful Author in the fulness of its accomplished work. I caught it between my hands ere it reached the ground; and there came over me a thrill of exultation, as if I had been touched by the Spirit. "Here," thought I to myself, "is a subject;" and with this subject I returned to my study.

A leaf, slightly as we pass it by, and heedlessly as we tread upon it, in consequence, probably, of the frequency of its occurrence, is one of the most wonderful productions of nature. The first consideration upon this, as upon every other subject, is to know exactly what we mean by the word we make use of; which, in the present instance, resolves itself into a correct answer to the question, "What is a leaf?" To find a correct answer to this is the more necessary, because many modern botanists, infected by a species of mania, to which they have given the name of "morphology," or the doctrine of forms,—and when they dreamed of which they must have been spell-bound by Morpheus, or some power more leaden still,—have endeavoured to persuade the world that thorns, and roses, and berries, and apples, and all sorts of fruits, are nothing but changed leaves; in short, lord Peter's conversion of the brown leaf into all the luxuries of the larder, was nothing to the metamorphosis of the leaf under the hands of these gentlemen. And, in order to complete the parallel, they stand ready to inflict as deep an anathema upon all who are sceptical as to their dogmas, as lord Peter did upon his two brothers, Martin and Jack, when they would not receive and eat the brown leaf as a shoulder of mutton.

A leaf, in the proper sense of the word, knows no metamorphosis. Sometimes it is well expanded, and sometimes not, according to circumstances; and its form changes even in the same plant, when that plant requires a difference of habit. There is no leaf, properly so called, upon the cellular plants, the mosses, the lichens, and the fungi; and, indeed, the latter of these, as they appear above the ground, or external of the bark of those trees on which they are parasitical, are flowers, and nothing but flowers. Sometimes the discrepancy in appearance and size between the flower, and the plant which produces it, is so great, that, while the flower is absolutely splendid in its magnitude, the plant is so very small, that it can with difficulty be discerned with the microscope: thus, for instance, the *krábút*, (*raffelsia arnoldi*), which grows in Sumatra, is in the shape of a well-formed flower, consisting of fine petals, of a foot in length each, with a nectary in the centre which would hold twelve pints, and the whole weighing fifteen pounds. This grows upon decaying wood in the wild forests of the oriental islands, much in the same manner as common fungi, or toad-stools, grow upon decaying wood in our own forests. But, notwithstanding the magnitude of this flower, which is greater than that of any other known one, observation searches in vain for the plant, and no root, no stem, and no leaf, can be discovered. This is but one specimen of a very curious class, which we shall probably have again and again to introduce to the notice of the readers of the "Miscellany." The whole class are, however, leafless; and were we to seek a practical answer to our question, "What is a leaf?" our appeal to them would be unavailing.

No herbaceous plant, that is, no plant the stem of which dies down seasonably, either with or without a similar perishing of the root, possesses a leaf, in the proper sense of the term; a blade of grass or corn, for instance, though a green development of the plant, and calculated to answer nearly the same purpose which a leaf answers in those plants which have leaves, is not a leaf.

Again, no plant which, standing for more than one season, grows from the centre only, or is what botanists call *endogenous*, which just means growing from the centre, possesses a leaf, in the true sense of the word; and there are some of the ever-green *exogenous* trees of tropical countries, of which it is very doubtful whether the green expansions come properly under the designation of leaves. The palms are stately trees of great beauty and long endurance; and the green expansions which form the crown of the palm are among the most graceful productions of the vegetable kingdom; but still not one of them is a leaf, they are part and parcel of the stem of the tree, which stem consists of nothing but the remains of those green productions.

What, then, is a leaf? It is a thing of the season, put forth in the year, and perishing with the year. There is a little difference in this respect; for most leaves upon the plants of temperate climates are produced in the spring, and shed in the autumn, and such plants are called *deciduous*, which means that they "part off." There are, however, a good many trees, even in such countries, as, for example, the common

laurel and holly, which do not shed the leaves of the former year till those of the passing year are considerably advanced. We call such trees "evergreens," and we are right, in so far as the succession is concerned, because the new green comes on before the old green goes off; but still their leaves are only for a season. We must pause, however, but shall speedily resume the "Story of a Leaf."

DEATH OF AN INFANT IN ITS MOTHER'S ARMS.

BY MRS. SIGOURNEY.

He slumbers long, sweet mother,
Upon thy gentle breast,
Thou'rt weary now with watching,
Sweet mother, go to rest:
There seems no pain to stir him,
The peril sure is past;
For see, his soft hand clasp'd in thine,
He heeds nor storm nor blast.

Why dost thou gaze so wildly?
Why strain thy strong embrace?
Unlock thy fearful clasping,
And let me see his face.
So down that mother laid him,
In her agony of care,
And kissed that cold and marble brow
With calm and fix'd despair.

O weep! there's holy healing
In every gushing tear,
Nor question thus that beauteous clay,—
The angel is not here:
No shut of rose at even-tide
Was with a peace so deep;
As thus thy youngest, fairest one
Sank down in dove-like sleep.

Where best he loved to hide him,
In that dear sheltering spot,
Just there his tender spirit pass'd—
Pass'd, and she knew it not.

His fond lip never trembled,
Nor sigh'd the parting breath,
When strangely, for his nectar'd draught,
He drank the cup of death.

Full was thy lot of blessing,
To charm his cradle hours,
To touch his sparkling fount of thought,
And breathe his breath of flowers,
And take the daily lesson,
From the smile that breathed so free
Of what in holier, brighter realms,
The pure in heart must be.

No more thy twilight musing
May with his image shine,
When in that lonely hour of love
He laid his cheek to thine:
So still and so confiding
That cherish'd babe would be,
So like a sinless guest from heaven,
And yet a part of thee.

But now his blessed portion
Is o'er the cloud to soar,
And spread a never-wearied wing
Where sorrows are no more,
With cherubim and seraphim
To tread th' ethereal plain;
High honour hath it been to thee
To swell that glorious train.

ENTOMOLOGICAL SOCIETIES.

Or a science so generally despised as entomology has been, it is very natural that the few votaries should find pleasure and satisfaction in each other's company; and, conscious of having a worthier pursuit than men give them credit for, should hold sweet council together, and look down on the very world that was looking down on them.

Many attempts have, therefore, been made in this country to establish entomological societies, the history of which it is the duty of the author to record, as far as he is able, from the remaining documents.

First. *The Aurelian Society*, which was held at the Swan Tavern, in Change-alley; the date of its formation is unknown, but from Moses Harris we learn that it existed in the year 1745. The laws and regulations of this society have not descended to us.

On the 25th of March, 1748, the great fire which happened in Cornhill burnt down the Swan Tavern, together with the society's valuable collection of insects, books, &c., and all their regalia.

The society was sitting at the time; yet so sudden and rapid was the impetuous course of the fire, that the flames beat against the windows before they could well get out of the room, many of them leaving their hats and canes.

Their loss so much disheartened the members, that, although they several times met for that purpose, they never could collect a sufficient number to form a society, so that, for fourteen years, there was no meeting of that sort.

Second. *The Aurelian Society* was established in the year 1762; it arose, phoenix-like, out of the ashes of the old; four years afterwards this society was in existence, as appears from the fact, that, in 1766, Moses Harris dedicated to it his work entitled the "*Aurelian*." We have no further account of it.

Third. *The Society of Entomologists of London* was established in the year 1780; its minute-book is carried down to the first week in August, 1782, at which time it appears to have discontinued its sittings. We hear from Mr. Haworth, that the cabinet of two of its members, Mr. Tinley and Mr. Bently, were rich in lepidoptera and coleoptera.

Fourth. *The Aurelian Society* was established in the year 1801; it was proposed and managed by the late Mr. Haworth, the author of "*Lepidoptera Britannica*." The collection was Mr. Haworth's own property, and was to be given up to the society as soon as it should consist of twenty members, which number it never reached.

The objects of this society were to form a complete and standard cabinet of the entomological productions of Great Britain; to ascertain their names, uses, and distinctions, the places and times of their appearance, food, economy, and peculiarities; and to point out to the public the readiest and most desirable methods of destroying such as possess properties which are inimical to the welfare of mankind.

Any person desirous of becoming a member of this society was to be approved by every member of the society at the time being; was to give up one specimen of every species in his own collection which the cabinet of the society did not possess. The elected member was to receive in return duplicate specimens from the society's collection, or money, if he preferred it.

By these means (say the rules) the Aurelian cabinet must ultimately arrive at the standard of perfection; and the separate collection of every member of the society will gradually increase both in number and value. But, alas! neither the society nor the collection ever attained perfection; the society was dissolved in April, 1806, and the collection returned to Mr. Haworth.

Fifth. *The Entomological Society of London* arose the same year, 1806, as it were, out of the ashes of the first, and consisted of nearly the same members which were in this society. No member was compelled to give up unique specimens to a general collection, but a small collection was formed, principally by the generosity of Mr. Haworth.

This society made more progress than either of the preceding; it met regularly, and published three numbers of *Transactions*, the last of which appeared in 1812; but after this, the death of some members, and other defalcations, brought the society into considerable trouble, and regular meetings were abandoned in the following year, 1813.

Sixth. *The Entomological Society of Great Britain*. A third society was formed in 1822, like the preceding, out of the ruins of the old one. This was a non-subscribing society; it lasted only two years, and then merged into the Zoological club of the Linnean Society of London.

Seventh. *The Entomological Club* was formed in 1825. This was also a non-subscribing society; it consisted of eight members, with no power to increase the number. Since its establishment, two vacancies only have occurred, each of which has been instantly filled by the election of another member; and the

club has continued to meet every month since the day of its establishment.

In the winter of 1831-2 it was agreed, at a meeting of the club, to publish a quarterly Magazine, the management of which was undertaken by members then present; the Magazine was to be open impartially to all contributors, no preference to be given to the members of the club. The first number of the Magazine, called, "*The Entomological Magazine*," was published on the 1st of September, 1832, since which period it has appeared every three months, with the utmost regularity.

The "*Entomological Magazine*" is published by Messrs. Westley and Davis, and has attained a very extensive circulation, not confined to this country, but on the continents of Europe and America. It treats not only of scientific entomology, but devotes a large portion of its pages to the history of insects, as connected with agriculture and horticulture.

Eighth. *The Entomological Society of London* was formed in 1833; its first scientific meeting was held on the 2d of December of that year; and succeeding meetings have been held on the first Monday of every month from that time to the present.

This society has been much more extensive than either of the preceding, having reached, in November, 1834, to the number of one hundred and twenty-seven members; a remarkable number, considering the unpopular nature of the subject, and the short time of the society's existence. It included among its members most of the publishing entomologists of the present day.

Unhappily, however, dissension has arisen on the propriety of expending the funds of the society in publishing *Transactions*. The advocates for publication being in power, the measure was carried against those of a contrary opinion, greatly to the dissatisfaction of some of the members.

On the 1st of November, 1834, a first part of the *Transactions* was accordingly published. And now another trouble arose: those entrusted with the publication had introduced into the *Transactions* an uncourteous review of the "*Entomological Magazine*," a work which, from the first, had zealously supported the society. This has alienated the friends of the "*Entomological Magazine*," and not them only, but many others, who insist that it is an unworthy act of a society to descend to such a course.—*Newman's Grammar of Entomology*.

REPLY TO MOORE'S "SACRED MELODY,"

BEGINNING,

"The world is all a fleeting show
For man's illusion given."

The world is not a fleeting show
For man's ILLUSION given;
The smiles of joy, the tears of woe,
Those as they shine, these as they flow,
Should ripen him for heaven.

'Mid clouds and sheen, 'mid blight and bloom,
Our labouring souls have striven
With sin, and learned beyond the tomb

To look, and, through its midnight gloom,
Hail the bright dawn of heaven.

Not to delude, light gilds the soul,
And storms are o'er it driven;
All griefs and joys that o'er us roll
Are messengers, and to the goal
They point—the cross and heaven.
N.

REVIEW.

Fisher's Juvenile Scrap-Book, 1837. By AGNES STRICKLAND and BERNARD BARTON.

The Christian Keepsake and Missionary Annual. Edited by the REV. WILLIAM ELLIS. 1837.

Syria, the Holy Land, Asia Minor, &c., illustrated, in a series of Views, drawn from Nature. By W. H.

BARTLETT, WILLIAM PURSER, &c., with *Descriptions of the Plates*, by JOHN CARNE, Esq.; author of "*Letters from the East*." First Series. 1836.

THE rage for Annuals, and their consequent multiplication, threatened, a few years ago, to throw a sickly hue over our literature, while they opened to

the painter and the engraver a wide field for the exertion and display of their talents. Whether the evil and the good have been equally balanced, we are not prepared to determine. With a few splendid exceptions, the latter has been gradually deteriorating, and we are sorry to add, that there has been no improvement in the former. Long before the gilt on the covers of these gorgeous nothings has been tarnished, by their exposure to the handling of all comers, on the drawing-room table, their insipid tales and namby-pamby verses are forgotten. Of "FISHER'S JUVENILE SCRAP-BOOK" for the present year, we can speak as highly as of any of its contemporaries. The pictorial department is well supplied with beautiful specimens of design and execution; but they are evidently not illustrations of the literary contents of the volume: the artist has not ministered to the writer, but the writer to the artist; and this, probably, will account for their great disparity in point of merit. "Wrington Church," by William Martin, is touching; and, in a true poetical spirit, breathes of nature and religion. But what has it to do with Wrington any more than with Clifton? What reference has it to the grave of Hannah More? At the close there is, indeed, an allusion, but too slight when compared with the interest and the claims of the subject. Hannah More is entitled to far higher distinction than a passing tribute, though she is above eulogy, and has reared her own imperishable monument in her works.

The following lines convey an impressive moral, and in a style of great simplicity:—

Children, behold,
Behold this beauteous caterpillar—now
Its way is sad, and earthy, dark, and cold,
Grovvelling and low.

Now it must creep,
Bound to the earth by nature's sacred ties;
Anon 'twill fall into a death-like sleep,
And then arise!

For soft and bright,
Within its earthy form a being lives,
Purer and fairer, more a thing of light,
And this survives.

When turn'd to dust,
The outward husk falls off—then, then it shows
Its second nature, lovelier than at first
In glory glows—

Springs up—awakes
A child of the bright sun, and bids adieu
To earth, and of a heavenlier garb partakes,
And lives anew!

Oh, semblance sweet
Of man's translation from this dusky sphere!
Who would not learn, and learning, still repeat
A lesson here!

Oh, know you not,
Sweet innocents, that you will pass away,
And that this outward form will fade and rot
In cold, cold clay?

But yet be sure
Within abides the soul—fashioned to soar,
That, when the world hath perish'd, will endure
For evermore.

We do not like the engravings the worse for having presented themselves to us on a former occasion, and under different associations. The pleasures of memory are among the purest enjoyments of life; and scenes and faces are not less welcome because they are familiar.

We have traced the progress of "THE CHRISTIAN KEEPSAKE," this best of the Annuals, with unfeigned satisfaction. Every year has added to its improvement; the spirit of the publishers has kept pace with the patronage of the public, and the volume upon our table is the result of both. To begin with the portraits:—

How often, when the poetry of Felicia Hemans has

stirred our bosoms with the loftiest and tenderest emotions, have we fancied to ourselves the form and features of a being so gifted, and so worthy of our admiration and esteem! and when her bust appeared, the *spirituelle* which classic taste had thrown around the marble, and which seemed to realize to our imagination all that we had conceived of an original, which we scarcely considered as belonging to the earth, we were gratified. But still there was something wanting—there was the poet, and nothing more. But what shall we say to the poet and the woman so sweetly blended in the portrait now before us? At the first glance we confess we felt something like disappointment; the features did not appear to possess all the delicacy and refinement, the form rather approaching to the *en-bon-point*, all the poetical elegance we anticipated. But we saw at once that it must be a likeness; and as we perused the countenance, which we did, till the eyes beamed on us with living intelligence—and the very lips had language—we felt that we were holding communion with the being who had so often carried us through her forest sanctuary up to the heaven of heavens. We now possess all of Felicia Hemans that cannot die; art has rendered the beautiful permanent, and her mind lives and breathes in her works.

Dr. Carey occupies in this volume his appropriate place: the first of Missionaries, the apostle of modern times, is worthy of all the honour that the Christian catholic church can possibly confer upon him. We thank Mr. Dyer for this brief memoir; we wish it could have been more extended, especially as the work of Eustace Carey is in so many respects below his subject, and, as we think, injurious to that high reputation which he had earned, as possessing the noblest order of intellect, and the purest elements of moral and religious character.

Thomas Clarkson. Both portrait and narrative are executed with fidelity and grace. The moral of the latter is, "The mighty effects single good men may realize by self-devotion and perseverance."

The next portrait, that of the Rev. William Jay, is inferior as a work of art, and, as a likeness, is a total failure. It ought to have been cancelled. Among all the portraits of this most justly popular and eminently useful preacher, how has it happened that not one has caught a single characteristic expression of his fine and now strongly-marked countenance?

The portrait of Bishop Ryder has all the individuality which we suppose the episcopal costume will allow. Lawn sleeves and a cauliflower wig may do very well to set off a picture, and to give an imposing appearance to their wearer; but the man they disfigure by excess of ornament. Dr. Ryder was a devout Christian, and a worthy pastor of souls under the great and good Shepherd.

Jan Zatzoe, a Christian chief of the Amakose, South Africa, is a spirited performance.

The subjects of the remaining illustrations are, Missionary Grave at Eimeo—Feast of the Mohurram—The Mountains of Aboo, in Guzerat—Dome at Worms—The bath in which Bishop Heber died—Rhodes—Church of Vasil Blagenni, and part of the Kremlin, Moscow—Marina, Malta—Dr. Doddridge's mother teaching him Scripture history by the Dutch tiles—Basle.

We promise our readers the highest gratification of taste in these splendid productions of art, and an equal mental pleasure in the perusal of the literary contributions by which they are accompanied. Two pieces, with the signature, T. Aveling, Highbury College—"The Missionary's Grave," and "The Mountains of Aboo," are fine specimens of talents which we rejoice to see consecrated to the work of the Christian ministry.

We have only room for one quotation. We have seen it before; but it deserves the widest circulation, not only for the beauty of the composition, but for the moral sentiment it conveys.

CHRIST, THE PURIFIER.

BY JAMES MONTGOMERY.

"The following story (I know not on what authority) is abroad in the religious world.—Some ladies in Dublin met together, from time to time, at each other's houses, to read the Scriptures and to make them the subject of profitable conversation; and when they came to the third chapter of the prophecy of Malachi, and some discussion over the second and third verses, respecting the method of purifying the precious metals. As none of the company knew any thing about the process, one undertook to inquire of a silversmith, with whom she was acquainted, how it was effected, and particularly what was the business of the refiner himself during the operation. Without explaining her motive, she accordingly went to her friend, and asked him how his silver was cleaned from any dross with which it might have been mixed. He promptly explained to her the manner of doing this. 'But,' said the inquirer, 'do you sit, sir, at the work?' 'Yes,' he replied, 'for I must keep my eye steadily fixed on the furnace; since if the silver remains too long under the intense heat, it is sure to be damaged.' She at once saw the beauty and propriety of the image employed: 'He shall sit as a refiner of silver;' and the moral of the illustration was equally obvious. As the lady was returning with her information to her expecting companions, the silversmith called her back, and said that he had forgotten to mention one thing of importance, which was, that he only knew the exact instant when the purifying process was complete, by then seeing his own countenance in it. Again the spiritual meaning shone forth through the beautiful veil of the letter. When God sees his own image in his people, the work of sanctification is complete. It may be added, that the metal continues in a state of agitation till all the impurities are thrown off; and then it becomes quite still,—a circumstance which heightens the exquisite analogy in this case; for, O how

'Sweet to lie passive in his hand,
And know no will but his!'

The subject was embodied in the following stanzas, at the urgent request of a friend, who, with her young family, was about to leave her native country, and settle in a distant part of the globe; but the writer's mind had received the first ineffaceable impression of the similitude and the inference in the year, 1832, from the lips of another dear friend, when she was nearly in her last agony, who meekly applied it to herself and her affliction, which had been long and excruciating, yet borne by her, as such pains can alone be borne, in God's presence and under his eye.

"HE SHALL SIT AS A REFINER AND PURIFIER OF SILVER."
Mal. iii. 3.

"He that from dross would win the precious ore,
Bends o'er the crucible an earnest eye,
The subtle, searching process to explore,
Lest the one brilliant moment should pass by,
When, in the molten silver's virgin mass,
He meets his pictur'd face, as in a glass.
Thus, in God's presence, are his people tried:
Thrice happy they who to the end endure!
But who the fiery trial may abide?
Who from the crucible come forth so pure,
That He, whose eyes of flame look through the whole,
May see his image perfect in the soul?
Nor with an evanescent glimpse alone,
As in that mirror the refiner's face;
But stamp'd with heaven's wrought signet, there be shown
Immanuel's features, full of truth and grace;
And round that seal of love this motto be,—
'Not for a moment, but eternally.'"

"SYRIA" is a work of noble enterprise, and worthy of the age and country which alone could have called it into existence, is thus introduced to the world:—

"The publishers of this work are most anxious that nothing on their part should be wanting to render it worthy of the subjects they have undertaken to illustrate, and the consequent approbation of the public. Deeply impressed, not only by the interest but by the sanctity which is attached to every memorial of the HOLY LAND,—to its ancient and much-loved recollections, and to the prophesied contrasts of its existing condition,—they have secured the literary co-operation of a gentleman whose name carries with it the assurance that the task could not have been committed to talents more eminently fitted to do it justice; while, in the various departments of the fine arts, they have spared no efforts which liberality could suggest, to improve the effect of the written matter by pictorial representations of the highest class."

It is only by dwelling for hours upon these truly oriental scenes that, by a kind of magic, present themselves to the eye as we turn over the pages before us, that any adequate estimate can be formed of their surpassing excellence. Where all is so exquisite, it is difficult to select; and description by mere words can do nothing towards conveying any thing like an impression of what must be seen to be felt. To us the whole appears to be enchantment; and, spell-bound, in vain we attempt to criticise. Why, the illustrations alone furnish at least a month's study; and an article to do them justice must be elaborated through many a page, and would be read with little interest. This is but the first series, others will follow, and we are assured by the prospectus that the forthcoming ones will increase in interest and beauty,—their artist, now in Palestine, having lately taken a series of views, the subjects of which have never been touched on before.

Mr. Carne's fervid style and imaginative spirit are admirably adapted to sustain the splendid character of the pictorial representations. His competence to execute the task assigned to him, in a literary view, none will question; and of his other qualifications the following passage is sufficient evidence:

"Most of the places illustrated in this work had been visited by the writer previous to the Egyptian invasion, when the land was in a state of comparative quiet, very favourable to a successful progress. To the oriental traveller, the pleasures of memory are greater than those of hope; on his devious way clouds and darkness often gather; the feuds of the chiefs may suddenly forbid all approach to the favourite ruin or city, imprison him in some hamlet or desert, where he is alone with his baffled hope and despair. Perhaps disease or contagion overtake him where there is none to help. But when his warfare is over, and his objects attained, when his own hearth and roof-tree receive him—then memory wakes to 'sleep no more.' In the murmur of his native wave he fancies he hears the distant rush of the Nile or the Euphrates; in the night-wind the blast of the desert again passes by; and, on the bleak moor, that 'Rock of ages,' that has been his shadow from the heat, again stands before him, desolate yet precious. These feelings may by some be deemed enthusiastic; but no man ever succeeded in an eastern journey, plucked its roses from its many thorns, and, in spite of fears and sorrows, went on rejoicing in his way who was not an enthusiast."

G E M S.

Why are not more gems from our early prose-writers scattered over the country by the periodicals? Great old books of the great old authors are not in every body's reach; and though it is better to know them thoroughly than to know them only here and there, yet it is a good work to give a little to those who have neither time nor means to get more. Let every book-worm, when, in any fragrant, scarce old tome, he discovers a sentence, a story, an illustration that does his heart good, hasten to give it.—COLERIDGE.

FRIENDSHIP.—Though the cultivation of friendship is not made the subject of precept, it is left to grow up of itself under the general culture of reason and religion; it is one of the fairest productions of the human soil, the cordial of life, the lenitive of our

sorrows, and the multiplier of our joys—the source, equally, of animation and of repose. He who is destitute of this blessing, amidst the greatest crowd and pressure of society, is doomed to solitude; and however surrounded with flatterers and admirers, however armed with power, and rich in the endowments of nature and of fortune, has no resting-place. The most elevated station in life affords no exemption from those agitations and inquietudes which can only be laid to rest upon the bosom of a friend. The sympathies even of virtuous minds, when not warmed by the breath of friendship, are too faint and cold to satisfy

the social cravings of our nature; their compassion is too much dissipated by the multiplicity of its objects and the varieties of distress, to suffer it to flow long in one channel; while the sentiments of congratulation are still more slight and superficial. A transient tear of pity, or a smile of complacency equally transient, is all we can usually bestow on the scenes of happiness or of misery which we meet with in the paths of life. But man naturally seeks for a closer union, a more permanent conjunction of interest, a more intense reciprocation of feeling; he finds the want of one or more with whom he can intrust the secrets of his heart, and relieve himself by imparting the interior joys and sorrows with which every breast is fraught; he seeks, in short, another self, a kindred spirit, whose interest in his welfare bears some proportion to his own, with whom he may lessen his cares by sympathy, and multiply his pleasures by participation.—*Robert Hall.*

TEMPER.—Of all qualities, a sweet temper is perhaps the one least cultivated in the lower ranks of life. The peculiar disposition is not watched; care is not taken to distinguish between the passionate child, the sulky, the obstinate, and the timid. The children of the poor are allowed a latitude of speech unknown among the higher orders; and they are free from the salutary restraint imposed by what is termed "company." When in the enjoyment of full health and strength, the ungoverned temper of the poor is one of their most striking faults; while their resignation under affliction, whether mental or bodily, is the point, of all others, in which the rich might with advantage study to imitate them.—*Tales of the Peerage and the Peasantry.*

PEACE ON EARTH.—At the glad period of our Lord's nativity, there was peace in all the earth. The prevalence of public peace upon earth had ranked among the number of those interesting signs and tokens which were to accompany the coming of the long-expected Saviour to the scene of his ministry. When we read in the page of prophecy, of the myrtle and the fir-tree taking the place of the bramble and the thorn; when we hear of swords beat into pruning-

hooks and ploughshares, we are led to fix our attention on that state of outward peace in this world which was to form the commencement of the gospel age, and to denote the time of the Redeemer's manifestation among men. Accordingly, these predictions were fulfilled in a remarkable manner at the date of our Lord's birth, which may be regarded as the commencement of his kingdom upon earth. Thus the reign of Augustus Caesar, after its first conflicts were decided, was accompanied by a season of profound and settled peace. The temple of Janus at Rome, which had been shut but twice since the foundation of the city, was at that time closed, in token of this public peace.—*Archdeacon Pott.*

LONDON.—There is no tomb so vast as London, which swallows up the most illustrious names for ever; it has an omnivorous maw. The celebrity of a man in London blazes and vanishes away like a firework; there are a great noise, numberless invitations, endless flattery and exaggeration, for a few days, and then an eternal silence. Paoli and Dumourier, after having, at their first appearance, made a crash like thunder, excited, when they died, no more attention than a falling leaf. General Mina, when he landed at Portsmouth, was carried to his hotel in triumph, and deafened with applause for a month together at the theatre in London; he was more famous than the Nemean lion. What then? He fell very soon into oblivion, and the grave closed over his name. The English people are greedy of novelty: childish in this alone, it makes no great distinction between good and bad—they want only what is new. They pay for the magic lantern, and pay well; but they always want fresh figures. To feed this insatiable whale, that always pants with open jaws,

"And after meals is hungrier than before."

toil incessantly journalists, engravers, historians, travellers, philosophers, lawyers, men of letters, poets, ministers with schemes for new enactments, the king with schemes for new palaces and buildings, and the liberals with schemes for parliamentary reform.—*Observations of an Italian Exile.*

MEN AND THINGS.

MUSIC.—An excellent clergyman, possessing much knowledge of human nature, instructed his large family of daughters in the theory and practice of music. They were all observed to be exceedingly amiable and happy. A friend inquired if there was any secret in his mode of education. He replied, "When any thing disturbs their temper, I say to them, 'Sing;' and if I hear them speak against any person, I call them to sing to me; and so they have sung away all causes of discontent, and every disposition to scandal." Young voices around the domestic altar, breathing sacred music at the hour of morning and evening devotion, are a sweet and touching accompaniment.—*Mrs. Sigourney.*

REV. WILLIAM GILPIN.—The late Rev. William Gilpin, vicar of Boldre in the New Forest, was in the habit of devoting a part of his leisure time to drawing; and he published several of his sketches, which were well received by the public, as also a work on the beauties of forest scenery. His residence in the New Forest afforded him many opportunities of sketching the majestic oaks with which the forest abounded, till the late war demanded them to recruit our navy. With the profits of his drawings, and solely from them, he endowed a school in his parish, for the instruction of the children of poor labourers, which he lived to see completed; and the parish is now deriving very great advantages from his benevolence. There is a school-house, with a permanent salary for a master.

OPIMUM MANUFACTURE.—The greatest part of the

opium used in Europe is brought from Asia Minor. It was now just the opium harvest, and the people were all in the fields gathering it. I went in among them, and saw the process, which is very simple. When the flower falls off, the capsule or seed-vessel is formed; they go in the evening to the plantations, and, with a hooked knife, they make a circular incision round the capsule; from this there exudes a white milky juice, which, being exposed next day to the heat of the sun, concretes into a dark brown mass, which is the crude opium of our shops. On the next and several succeeding evenings, they come and scrape this off, as long as the plant continues to exude it. The opium sent to Europe is always adulterated: they boil down the poppy heads with other narcotic plants, and having inspissated the juice, wrap it up in poppy leaves, and send this impure mass in cakes for our use.—*Walsh.*

EPITAPH IN CAMBERWELL CHURCHYARD.—"Sacred to ye memory of James, son of James and Sarah Robertson, of this parish, chimney-sweeper, died 14th Sept. 1828; also Jane, dau. of the above, died Jan. 8th, 1834, both infants.

Their ashes and their little dust
Their Father's care shall keep,
Till the last angel rise and break
Their long and dreary sleep."

The "dust" and the "ashes" of the small sweeps are as natural as poetical.

AUTHORS AND THEIR RESPONSIBILITY.

"An author, by profession, had need narrowly to watch his pen, lest a line should escape it which by possibility may do mischief when he has been long dead and buried."—*COWPER*.

"We are a nation of readers:" literature, from a luxury, has become a necessary of life. It circulates through all classes. The press every hour teems with publications, which are devoured with avidity, especially among what may be called the people, as distinguished from the aristocracy. Yet is it a remarkable fact, that mere authorship leads to neither emolument nor fame. A few brilliant exceptions establish, but do not contradict, the general assertion. As the cause or the consequence of this, men who follow literature as their only pursuit have no fixed principles: thus many of them are ready to espouse any party, or any cause, in which they can enlist their mercenary services. But as they are, for the most part, sceptics and infidels when they appear, as they frequently do, on the side of religion, whatever church or sect they may defend, they soon discover either their profound ignorance of the truths of Christianity, or their total alienation from its genius and spirit. What pious divines! what mild and gentle Christians are those zealous advocates of the church militant! who edify, from day to day and from month to month, the admiring readers of the "Times" newspaper, the "Standard," the "John Bull," and "Fraser's Magazine." Nor are some of the most popular and liberal Journals and Periodicals a whit superior to these in their strictly moral and religious tendency. In publications from which we might expect better things, we sometimes meet with passages as opposed to Christianity as they are to good taste, and which excite our unqualified disgust. This censure, of course, is not intended to fall where it is not deserved.

While it is too obvious to be denied that our periodical literature is essentially at variance with the truth, the purity, and the charity of what it nevertheless is in the habit of designating "*our* holy religion," we are sorry to be compelled to bring the same charge against some of the most able, and therefore the most influential, writers in every department, whether of science or letters.

It was remarked, some thirty years ago, in one of the most eloquent productions that ever issued from the press, that "a considerable proportion of those who pursue literature as a profession, might justly be considered as the open or disguised abettors of atheism;" and we know not whether, since that period, the generality of writers of this description have much improved. Something, it is true, has been effected in the way of counteraction. Infidelity assumes not, perhaps, quite so bold a front, or so high a tone as formerly. Backed, however, by the genius and talents of the writers of the preceding age,

among whom are ranked profound philosophers, subtle reasoners, splendid historians, and captivating poets, who still hold and charm the public mind, the writers of our own day feel their influence, and follow in their steps. Thus we have works of mathematical science, critical dissertations, systems of theology, voyages and travels, with a legion of airy and sentimental novels, which seem to be written, if not with the intention, yet with the certain effect, of bringing into general discredit the peculiar and characteristic principles of the gospel. Nor can any man whose opinions are not fixed, and whose religious character is unformed, rise from the perusal of these insidious and dangerous productions without imbibing a spirit or receiving an impression unfavourable to his eternal interests.

The most serious evils to society result from the debasement of learning, and the prostitution of genius. For when intellectual talent, combined with literary acquirements, takes the wrong side, multitudes are first allured and then destroyed. If a man of the highest order of mind misleads when he ought to instruct, he may do mischief as long as the world lasts; he is a nuisance to future ages, and lays a snare for those who are yet unborn. Genius is immortal: the bloom upon its countenance cannot fade; the music of its voice never falters, nor does it ever cease to charm. The sons of Genius seem destined by the God of nature to be the master spirits of the world; but great talents are too often united with little virtue—frequently they are in corrupt alliance with vice; thus some of the finest efforts of the human intellect are but the splendid memorials of depravity, and yet they live. The pen and the tablet of genius are like those which Job passionately desired, that he might transmit his faith in a Redeemer to generations; and when writers of this high character pollute their works with those corrupt sentiments, which are more injurious to society than the pestilence, they "poison a fountain that runs for ever." When Lord Byron's works were in the zenith of their popularity, an author, extensively acquainted with the world of letters, thus expresses his painful apprehensions of the results of so much impiety and licentiousness having been industriously circulated among the people. "I confess I look at the daily accumulation of our infidel literature, especially in the form of cheap and popular poetry, with a dread, something like what is felt by the traveller who, amid the mountains of Switzerland, beholds the slow moving glacier, from whose surface rise pyramidal crystallizations and precipices,—most wonderful forms of sublimity and beauty, invested with all the colours of the rainbow, and shining with dazzling splendour. He is overpowered with the greatness and majesty of the scene;

but, as he gazes, the mighty mass moves on, withering and destroying in its progress all the beauty of the spring, the verdure of the fields, and the habitations of every living thing." If we cannot sympathize in all the feelings which dictated this powerful passage, yet we can understand and appreciate the causes which produced such an impression on the mind of its author. Some there are, though we are not of the number, who ridicule the notion that poetry, whatever be its moral qualities, can inflict any very serious injury upon society; who maintain that it is to be regarded rather as a source of amusement than as a vehicle of principles. We admit that the immediate end of poetry, as indeed of all the fine arts, is to impart pleasure; and, as far as art alone is considered, the pleasure afforded is pure and innocent—it is that of taste; which is, perhaps, the most refined and delicate of our intellectual enjoyments. But who will contend that the arts, and especially poetry, have not an *ultimate* as well as an immediate end; that, because they impart pleasure, they cannot convey instruction?

Character is formed by a combination of thoughts and impressions acting together upon the heart in the form of principles. Whatever operates upon the mind with the greatest vividness and force, is a moral instrument of inconceivable value. Such an instrument is poetry, and it is mighty for evil as well as good. When of the highest order, its intellectual forms become living realities, and produce impressions which no time can efface:

———"A thing of beauty
Is a joy for ever."

Poetry is most attractive at that period of life when we are most susceptible. It comes upon us in the morning of existence like another sense; a new world rises like a new star in the heavens; it is the world of imagination; we gaze upon it with delight, and henceforth it becomes the star of our destiny. If its course be directed heavenwards, we pursue it; if it wander towards the regions where there is "blackness of darkness for ever," it entices us downward, and "our ambition is to sink." In other words, the thoughts and impressions which poetry conveys to our youth, become more or less the elements of our moral being, and unless a mightier counteracting energy interpose, they may decide our fate for ever. Hence it is impossible to measure the guilt implied in the publication of certain works which we forbear to name. That they are invested with the charms of poetry, and bear the impress of genius, only increases their power for mischief. In such pages, those who seek amusement may in the end, find despair.

It is high time to commence the great work of purification in every thing that regards the

future; nor are we to be hopeless even of the past; for, if we are true to the rising generation, and arm and sustain their minds with all that is wise and holy, those writers of former times, who now fascinate, will disgust; at least, the good they contain will be winnowed from the pernicious, like wheat from chaff. Little do men of powerful intellects and of high attainments imagine how much of evil it is in their power to repress—how much of happiness to impart. "Observe a man of talents," says a writer of some celebrity, "bowing to the sacred obligations of a religion, the essence of which consists in the purest love to God and man. He appears in the world 'clear as the sun,' and 'fair as the moon.' His sterling abilities are universally acknowledged; but they never appear so striking and excellent as when employed in defence of the gospel—in repelling the attacks of infidelity—in wiping off every foul reproach from the insulted character of Jesus of Nazareth, and his humble followers."

But we want writers of such a character in every department of letters; not directly to take up the defence of religion, but rather to guard its honour from assault, to repudiate every thing false in principle, and impure in sentiment. What might eloquent historians and genuine poets accomplish for virtue, and truth, and religion, if they were to consecrate their genius to the well-being of mankind?

If Rollin had possessed Gibbon's superior talents, and Byron Milton's sublime devotion, how lofty, how permanent, would have been their fame! because it would have been the meed of usefulness, the voice of universal gratitude echoing from age to age till the end of time. Rollin is entitled to the reverence of all the friends of virtue and piety; Byron, alas! and all of his pernicious school, are worthy of their execration. But Rollin is not like Gibbon—universally read; and the writer of "Paradise Lost," it is to be feared, in numberless instances, is compelled to give place to the blasphemous author of "Cain."

If our feeble voice could be heard in the lofty circle of mind where intellects of every capacity are engaged in the various pursuits to which they are impelled by their interests or their passions, we would call upon them to reflect on their moral responsibility. Their obligations to their fellow-men are just in proportion to their power of conferring benefits upon them; and they are accountable to almighty God for the abuse of those talents with which he has endowed them, and which he will require of them another day. We doubt not that there is more than one living writer that would willingly see the disastrous light extinguished which the early efforts of his genius cast around him, and which, like the seducing meteors of the swamp and the morass, have allured many to their destruction.

It has often occurred to us that the heaviest

weight of responsibility rests on that class of writers denominated "Reviewers." Our monthly and quarterly sheets of criticism, as they are for the most part written, belong to party rather than to mankind; and, instead of exhibiting Christian virtue in the meekness of wisdom, they breathe, too commonly, hatred, malice, and all uncharitableness. Yet what important services are they capable of rendering to the cause of human happiness, as the vehicles of moral and religious instruction. Genius and science, taste and learning, are indeed the legitimate and immediate subjects of criticism. But the attention of Reviewers neither can nor ought to be restricted to these: they not only stand, as sentinels in the avenues of fame, to examine the pretensions of every candidate for immortality, and to interrupt the progress of stupidity, ignorance, and folly,—but they ought also to be the guardians of morals and religion.

Infidelity, arrayed in the garb of genius, should be arrested in its course, and branded with the mark of reproach. The writer who, by innuendos or sophistry, would awaken suspicion of the truth of revelation in the minds of the ingenuous and uninformed; who, ostensibly aiming at a different object, takes occasion to maintain a secret warfare with the Saviour of the world, and his august train of apostles and evangelists, of confessors and martyrs; who, in the records of history, in narratives, in elementary treatises, dares to infuse a moral poison, destructive of the happiness and very existence of society, should have pointed against him the shock of critical vengeance, and the reviewer should blast, with intolerable infamy, the atrocious productions of his pen. Those authors who would pour the ordure of their Ebidinous imaginations upon the mind; who celebrate in poetry and in prose the demon of lewdness, as if it were the angel of love; who insult decency, and commit treason against virtue, should be denounced to mankind, and driven from the tribunals of literature as detestable offenders.

Other writers there are, whose productions contain the subtlety of the serpent, as well as his poison, and who steal upon the unsuspecting, wearing the garb of philosophy, and sometimes the imposing vesture of religion; but whose aim is to perplex, to confound, and to destroy all moral distinctions, to break down the ancient boundaries of virtue, to go beyond the *ultimatum* in metaphysics and moral science, which, from the limited nature of the human mind, and the disadvantages under which it must labour in the present state, no daring adventurer can pass, without plunging into boundless scepticism. Works of this description, as they are most specious, so they are peculiarly dangerous; and

the youthful inquirer should be warned against approaching the enchanted circle of their influence. It is the province of the Reviewer to detect the errors of such performances, to refute their sophistry, and to expose their tendency. Reviews would soon work a most salutary change in the moral character of our literature, if they were ably and powerfully conducted to that end. Men of genius would thus be compelled to feel that no works could pass without the stamp of infamy, but those which advocate the enduring interests of mankind. This would be restriction enough; for the very constitution of human nature, the unalterable laws of the mind of man, against which all rebellion is fruitless, render it impossible that we should be indifferent to applause or condemnation. We never can be wholly independent of the praise and blame of our fellow-men.

Besides the influence which reviews would thus acquire over the various writers in the different branches of science and literature, they might frequently give a prominence to religion and morals by defending truth; not merely by condemning the erroneous and dangerous tenets which came before them, but by entering into the argument, and boldly avowing and maintaining their own sentiments, exhibiting the fallacy and weakness of their opponents' reasoning, and showing that piety and virtue can be as ably supported as they have been ingeniously attacked. The public will listen to their reasons, when it will not always so readily bow to their decisions. Thus they not only repel an adversary, but gain a conquest—they vanquish an enemy, and take the spoil.

To accomplish this object we shall devote our pages, as journalists as well as critics, furnishing our quota with those few periodicals which are really intended to advance the cause of general knowledge, in strict alliance with the diffusion of religious principle. We do not despair of having able and efficient coadjutors. The period is arrived when something ought to be attempted. Why should the walks of literature be occupied chiefly by our enemies? Why should the dangerous association be formed in the public mind between irreligion and talents, weakness and piety? Alas, we have slept too long! Let men of talents and erudition take their several departments, and employ their pens under the solemn conviction that they are the apostles of knowledge, of religion, and of virtue, and let the patrons of our literature, that is, the great mass of the educated public, withhold their support from all works of a suspicious or openly injurious character, while they effectually promote the circulation of those which bear the impress of wisdom and truth.

IS MAN A MERE ANIMAL?

This is a question which, notwithstanding a verbal expression of belief to the contrary, must arise in the minds, not of the unlearned only, but of the learned; and though the answer of every person, who has learned after the right manner, must consist of the simple and single word "no," yet there are certain expressions made use of by persons of learning, and in the judgment of charity, of piety, which have virtually all the power of a "yes." With those who descant upon the wonders of creation, and in proper hands, no descant is more delightful; there is nothing so common as to hear of the wonderful sagacity—the marvellous forethought and purpose with which animals do this or do that. The bee, in the construction of her cells, is a profound mathematician, and has found out that, of all forms, hexagons are the ones which can be applied to each other with the greatest capacity in the individual cell, and the most complete occupation of all the space over which the cells extend. Then the manner in which the planes at the bottom close the cells, and make each cell support another with the strength of an arch, is the most consummate application of the principles of statics. No human ingenuity could by possibility come up to this perfect science of the bee; and, as the cells answer a purpose, these wise ones say, that the bee has this purpose steadily in view when she constructs the cells. So, also, as every parent insect is charged with the continuation of her race, before her own body is given to the dust, deposits her eggs in that plant, that animal, or that other substance, which is best fitted for giving nourishment to the animal, she does it all of forethought, purpose, and with far more certainty in the execution, than man can do by the exercise of all his boasted reason. The sagacity of the dog, of the elephant, and of countless other animals, is referred to the same class of faculty; and the beasts get credit for being most profound thinkers.

We shall not swell the catalogue, neither shall we particularize any of those very wonderful operations performed by animals; and we have alluded to the subject solely for the purpose of laying the axe to the root of a most mischievous error, from the trammels of which it appears that men of learning and piety are not always able to disenthrall themselves.

We bid them calmly and solemnly to reflect of whose work they are speaking, when they attribute this reasoning and sagacity to those animals, and, by so doing, offer up the immortal spirit of man as a sacrifice upon the altar of foul idolatry. Did not the Almighty create the world? Did he not see the end of all things from the beginning? Did he not set the signal of his wisdom and his power equally upon what we call the mighty and the mean? Let them

look round that glorious world, that mighty universe which he has made; and, when they do so, let them say where the point is in it, in which wisdom superior to the wisdom of man is not displayed. The planet in its orbit; the seasons in their revolution; the plants in their growth; every metal and every mineral in its crystal: how wise the earth is, that never wanders from its path! With what forethought does the spring come at its appointed season! With what matchless arithmetic does the crocus work out the day upon which it shall open its golden cup! And with what perfection of geometry does every mineral form its crystal, without deviating from its normal type the millionth part of a degree in a single angle! Where is the cube so perfect as in sulphate of lead? And what oblique prism is so contact to its angle as carbonate of lime? These things cannot be denied; and, therefore, if they construct by reason, the reason of man is chaff compared with the dullest of metals, or the most common of minerals!

But shall we thus peril the glories of our own immortality? Because God is all-wise and all wonderful, shall we be fools? May he in his mercy forbid, and guide us to a more rational use of that delightful faculty of speech with which he has endowed us. If we grant reason and understanding to the bee, or any other insect—to the dog, or any other animal—how dare we deny it to a flower, a leaf, a crystal of stone, or even to water, which not only finds its own level, but teaches man how to find the level whenever such a finding is necessary?

These creatures never err: they are all the same, "yesterday, to-day, and for ever;" and they know no more variation from their regular form, and the customary time of their development, than the planets in their orbits do from their courses. But man errs; and, in most instances, for once that he is right, he is twice wrong.

Why is this? Why should it be that among all the parts of so delightful a creation, there should be a single blunderer, and, he in other respects, the most highly gifted of the whole? We answer, and the spirit of the revealed word of God answers along with us,—that the doings of man are the only part of creation in which plans are to be formed, and carried into effect by an intelligent principle, which is limited in its powers; and man fails, because God has delegated to him that which has been delegated to no other creature. It is thus that the very frailty of man stands up a witness of an immortal spirit within him; for while all the rest of nature is fixed, and confirmed by the laws of nature, man is the only creature that can err.

We shall return to this delightful subject.

PREDICTIONS FOR 1837.

January.—If any persons expected an eclipse this month, they will be disappointed. The eyes of the nation will be drawn to London. Events will take place this month which have never transpired before, and never will again. Sore throats, railroad meetings, and newspaper squabbles, now about. Towards the latter end of the month his Majesty will lose *his* speech, and find another full of promise, but not at all to the purpose.

February.—The Church newly *rated*. On the 30th, the Establishment will be pronounced out of danger; tithes will be popular; and Ireland happy.

March.—The post-office balloon encounters a dreadful gale on its way to France, in consequence of which the mails are lost in the Channel.

April 1st.—A person nearly related to, and much beloved by the reader, will narrowly escape winning and wearing a cap and bells.

May.—Numerous benevolent and religious meetings in the metropolis, at which many persons will be suddenly seized with fits, attended

with spasmodic contraction of the hands, and extreme coldness in the region of the heart.

June.—Both Houses of the Legislature filled with smoke; but the nation need not be alarmed, for should there be a fire, it will be, as before, not until the session has closed.

July.—I clearly foresee that every soul found skating during the dog-days will be inevitably lost.

August.—The "collective wisdom," assembled in February for the despatch of business, will now be prorogued for the despatch of partridges.

September.—Many gun accidents to precocious young gentlemen. The north-west passage still undiscovered.

October.—Towards the close of this month days and nights nearly equal, especially in London, if foggy.

November 8th.—Many turtles may be seen, near the Mansion-house, on their backs. 10th.—Many aldermen, *ditto*.

December.—A great many fires, especially in large mansions. The glass down to 24; *Ward's Miscellany* up to 100,000.

FICTION.

ARTICLE THE FIRST.

THERE IS, perhaps, no realm within the dominion of literature which presents to the studious inquirer a more extensive and varied range of rich thoughts and romantic imaginations, a more widely-spread and almost boundless reach of airy greensward, whereon fancy may revel, than among the regions of fiction. Its birth-place has been recorded, by the best writers, to have been among the scenery, groves, and golden palace roofs of the East, in those lands "where the nature of the climate, and the luxury of the inhabitants, conspired to promote its cultivation." The riches of luxury, splendour and magnificence, were there ever around it; and from these beauteous handmaids it received its fresh supplies of romance and song, from ever-springing fountains, whose birth-place was among the silent hills and shadowy groves, in the beautiful lands of imagination and poetry. Surrounded by such bevièd beauties, we shall not be surprised to find that love, and the affections of the heart and soul, were among its earliest and most delightful associations;—that the luxury and the charm of the passions threw the rich and fervid glow of their spirituality over the story and the fiction, couching them all in language of the softest and sweetest romance. But in the olden days of the antique and oracular wisdom, there were some (and these were not few in number) in whom the mirthful jest and the honeyed laughter gave a lighter shade to the

morality and decorum they professed to practise, than were visible in the thoughtful expression of the more severe and rigid philosopher of the schools. From the sunny lands of eastern Persia, the wonder-working spells of imagination and fiction travelled, to sojourn for a while under the pure and more classic skies of Greece; and if the venerable practices and solemn philosophy of the learned and the wise of that land repudiated, at first, the advances of one whose careless and winning guise they would not suffer to pollute the inner *penetralia* of their paternal privacy; there were yet not wanting spirits who gladly welcomed the winning smile and joyous laughter of fancy to their homes, and sent her thence, in laughing triumph and jocular revelry, through the hills and valleys of the golden Grecian land. But here the humanity of man's wisdom was not the only soil over which fiction travelled. *Æsop*, that funny fellow, whose strokes of genuine humour and joyous jesting are connected with the lesser cares and merry smile of youth, gave both tongue, and speech, and reason to the brute creation, and did thus obtain, and will ever continue to uphold, a wider and more generous sphere of popularity, by his laughter-moving apoloques, than the merriest jester who has ever succeeded him. *Lucian* invests him with the office of merry jester in the islands of the blessed; and *Philocleon*, when narrating the arts by which the Athenian suitors sought to unwrinkle the brows

of the popular judges, placed the pranks of this funny reveller in the foremost rank. Æsop has been a time-honoured jester, in all ages.

But we must pass on, with a swift flight, over the various phases which fiction assumed in the later days of the Grecian poetry, drama, and pastoral romance, and hasten from the revelries and absurdities of early pagan fiction, to the period when, during the middle ages, it put on a richer and more gorgeous guise of enchantment. With the change in the character, manners, and customs of the nations with whom fiction had now become a household dweller, so did a more potent and prodigious alteration take place in that literature which had hitherto served for the popular vehicle of fictitious narrative. The various characters and adventures through which it passed, the embellishments and adornments in which it was dressed up, were altogether of a nature calculated to confound, astonish, and surprise. Some of these were giants, dragons, evil spirits, and dwarfs, and that "a local habitation," mystic and wonderful as the dwellers themselves, should be provided for them, the chances and changes of their wondrous existences were always to find a safe resting-place and abode within the walls of an enchanted castle. Fiction now assumed a new character, and was joined in brotherhood to romance; and numerous have been the theories and speculations indulged in to account for the origin of romantic fiction in Europe. Of these the most probable, and involving the nearest approach to truth, is that which somewhat justly ascribes it to the northern Scalds and the Arabians; and on this subject a judicious compiler thus remarks: "Without incurring the charge of credulity, it may readily be believed, that although the earliest fabrics of romantic fiction were raised by a Norman architect, with the product of his northern quarries, yet the form of many a pendent keystone, reticulated moulding, and indented battlement, may really have been influenced by the recollection of the presence-chamber of the Soldan, the mosque of Cordova, or the Alcazar of Segovia." But if the tinge and barbaric richness of romance and fiction had originally shed over it the heavy splendour and gloom of the gothic ages, yet the delicate enchantments of the eastern land of its birth, were still to be seen shining out, like the delicate lights of the northern aurora, amid the gloom and shadow of the darkness of the surrounding night. The eastern *peri* became the fairy of Europe, and the griffin, or hippogriff, of the Italian writers was but the famous *Simurgh* of the Persians. In the same manner, though retrograding somewhat, may we trace "the palaces glittering with gold and diamonds" of the "Arabian Nights," to the rich and pagan splendour which throw such a charm over the pages of Ovid. Southey takes a different and a more extended view of the subject when he says, that "the machinery of the

early romance writers is probably rather of classical than oriental origin. Classical superstition lingered long after the triumph of Christianity. Enchanted weapons may be traced to the workshop of Vulcan, as easily as to the deserts of Scandinavia. The tales of dragons may be originally oriental; but the adventures of Jason and Hercules were popular tales in Europe, long before the supposed migration of Odin, or the birth of Mohammed. If magical rings were invented in Asia, it was Herodotus who introduced the fashion into Europe. The fairies and ladies of the lake bear a closer resemblance to the nymphs and naiads of Rome and Greece than to the peris of the East." In support of this dictum, laid down by so great an authority, it has been urged, that the "very peculiar style of embellishment" to which the term "romantic fiction" may be most appropriately applied, owes no inconsiderable portion of its apparent peculiarity to causes which, whether they be regarded as beauties or deformities, will be found to be very near the surface. It is but the formal outline, and the variation of the costume, which prevents our noticing how very closely the forms of "the barbarous ages" are copied from the purer models of Greece and Rome. Place the altar-tomb by the sarcophagus; in the former the hands are uplifted, in the attitude of prayer, instead of grasping the sacrificial patera. The dog, the emblem of fidelity, is removed from the sides of the monument, and placed beneath the feet of her whose virtues it commemorates. The acanthus has only enveloped each pillar with a wilder grace. The genius, holding his extinguished torch, has given way to the sainted martyr, who bears the instrument of torture which tried his constancy, or the palm which denotes his victory over human nature. And the butterfly, the mystic type of death and immortality, has disappeared before a more holy symbol. But it is soon seen that it differs much less from its graceful prototype than it appeared to do when first contemplated in the "dim religious-light" of the sepulchral chapel. In the same manner it may be stated, that however widely these extraordinary fables of romance differ from the classical tales of antiquity, it is certain that the dissimilarity is much enhanced by considering them apart.

Whatever objections may occur to some of these details, or whatever room there may now exist for the formation of any new hypothesis concerning the system adopted by Wharton and others, in their researches on this most interesting subject, the ground-work which they laid down remains unmoved, and its verity and stability unquestioned: that system which, making Persia the common and primitive source of romantic fable, deduces its progress through two distinct and widely-distant channels, to the same ultimate end and bourne; receiving, in its double

course, the various impressions, on the one hand, of all the gloom of northern superstition, and the bold enthusiasm of northern courage; on the other, of all the brilliancy and voluptuousness, the extravagance and caprice, and the occasional sublimity of southern genius. Again, in reference to this subject it may be further observed, that in this reunion of the two derivative streams of romance, their several ingredients were mixed in very different proportions, according to the genius and habits of the different western nations that received them, or the times and circumstances under which their reception was accomplished.

But, during the period of the middle ages, the province of fiction became that of especially eulogizing the virtues, fame, and renown of chivalry; and we might well fill many numbers of our *Miscellany* by narrating the various deeds of romance and fiction in those days of knightly arms. One of the most noted volumes of that age was the "*Lyfe of Virgilius*;" it holds a very conspicuous place in the literature of the middle ages, and is wholly composed of the traditionary fables which were once current respecting the bard of Mantua. It is related, in that day, that St. Louis fixed an import duty upon monkeys, at the *Chatelet de Paris*. The monkey of a traveller, who had bought him for his own disport, came in duty free, the monkey of a merchant, who had bought him to sell again, paid four *deniers*; but the monkey of a minstrel was bound to dance before the custom-house officer, who was directed to accept this display of the talents of the long-tailed figurante in discharge, not only of the monkey-duty, but of the duties to which the articles intended for jacko's use would otherwise have been liable. The merry-making couple were long welcomed in hall and bower; until, in process of time, a great change took place in manners,—the monkey continued a favourite, but the doors were closed against the minstrel.

But if we go on with the rapid tide of history, we shall find that, during the life-time of Francis the First, and the dominion of the profligate court of Catherine of Medicis, sensuality, fanaticism, and faction, united in unsettling the mind of man, and rendering it unfit for the cultivation of genuine literature. During this period, however, some poetry was produced, for poetry must have vent; but those writers who hoped to be read, were almost wholly employed in productions calculated to fan the flames of libertinism or discord.

The earliest records of that poetry which now began to appear in France and England, were metrical romances. In Italy, verse received its structure and genius from the Provençals; and love and devotion were the only themes of the sonnet, and the other lyrical productions cultivated by the fathers of Italian verse. Until Boccaccio invented the *ottava rima*, narrative poetry cannot be said to have existed in Italy.

But, about this same period, the Spanish novelists also began to appear, and soon enjoyed a degree of popularity, at home and abroad, fully equal to that enjoyed by the Italian writers of the same class. We are told that, in those days, before the work of a Spanish author could see the light, it was obliged to be passed through a tremendous defile of bishops and inquisitors, lords of the council, secretaries of state, and notaries royal and apostolical, whose licenses and approbations generally filled half a sheet at the beginning of each volume. This wretched system produced one solitary benefit, to compensate for its manifold evils,—it completely checked the corruption which disgraced the pages of the French and the Italian writers of that period. The Spaniards might, therefore, boast that their language was not profaned by becoming the vehicle of impurity. Another distinguishing feature of the Spanish *novella* was its length; it was generally a very extended and complicated narrative. The Italian *novella* was often confined to a simple joke or apophthegm, or to a single adventure. Of the early German literature, much valuable information has been collected by the labours of Göius, Hagen, Büsching, and many other writers, who have applied themselves with the greatest ardour, energy, and judgment to the investigation of the ancient literature of their country. The romance of their chivalrous deeds remained in fashion until the commencement of the thirty years' war; the long continuation of which subverted, after a time, the ancient habits of the people. They then began to imitate the spirit of the olden romances, which retained their popularity among them during the early part of the seventeenth century. From that period up to the times of the present day, the Germans have continued to attach a vast degree of importance to the novel and romance; and this species of composition forms a most important and extensive division in their literary history, it having been illustrated and cultivated by almost every author among them of real or fancied eminence in the world of letters.

If we dwell awhile upon the consideration of the personages and incidents which are developed in the mazes of an epic poem or a chivalrous romance, we shall soon discover that the effect of their perusal is to conduct us into a mystic world of enchanted wonder, inhabited by powerful and supernatural agencies, as well as by beings inheriting a portion of the human character and wisdom of man. And wherever these latter beings have a preternatural and powerful energy given to them, altogether inconsistent with that under-current of human nature, which is suffered, in some degree, to *make them of the earth, earthy*, and *regulate their character and conduct*, the events and circumstances which, in the development of the romantic catastrophe, these beings are designed to unfold, are also in

themselves found to be of a nature widely and distinctly different from those which regulate the common and every-day course of human affairs.

We have thus taken a swift and rapid survey of the different species of fiction, their ages, histories, and general distinguishing characteristics; but ere we proceed further in the investigation of this subject, we must, in concluding this article, bestow a few remarks on a division of the subject which is endeared by the memory of early childhood, and its unalloyed and happy associations. Mean and comparatively humble as are the puny fictions of our early nursery literature, these minor efforts of the human intellect show more clearly, perhaps, than may be generally supposed, the secret workings of a lowlier study—a younger offshoot it may be—of the universal book of nature. Sir Walter Scott has observed, most eloquently, on this subject, “that a work of great interest might be compiled upon the origin of popular fiction, and the transmission of similar tales from age to age, and from country to country. The mythology of one period would then appear to pass into the romance of the next century, and that into the nursery tale of the subsequent ages.”

Thus might fiction be resolved into the earlier

and more primitive elements of its creation. The scenes embodied in the recesses of a vivid and dreaming imagination, in the earlier childhood of life, would become the offspring of a fond and fervent faith in future years. Sanctity thus clothes the dream before the altar of the idol. From the earlier days of the Celts, the foundations of our own popular nursery literature have been laid; and from its earliest birth peesy has nursed, watched over, and strengthened it, until it has grown with its growth, and strengthened with its strength, to the full period of its mature manhood. The popular nursery fictions of our own country may claim, with those of the continent, one common kindred of birthright; and as the people of England and of the Scottish lowlands are, undoubtedly, offsets and grafts from the Teutonic stock, it may, therefore, be considered as highly probable that our popular fables are also chiefly of Teutonic origin. Indeed, these idle imaginations and stories of our childhood may boast of a more distant origin, in the annals of the olden time, than those romances and poems which boast of, and clothe themselves in, the bravery of greater and more wonderful pretensions.

ERAS.

STANZAS TO THE MEMORY OF —.

Thus only tie that bound me here
Is severed now for aye,
The only dream that still was dear
Hath passed in death away;
And what remains, since thou art gone,
For him whose heart was all thine own,
But unregarded and alone
To linger out his day?

From beauty's melting eye and smile
Thy doom hath set me free,
The charms that other hearts beguile
Are passed unmark'd by me;
If mirth her festive scene display,
I mourn the most where all are gay,
And pine in silent grief away,
To weep and think of thee.

For in the heart thine image fill'd
The memory of thy doom;
Each hope hath crush'd, each feeling chill'd,
But those which deck my tomb.
The home which thou wast wont to bless,
Though bless'd no more, is thine no less;
Nor shall it fade in wretchedness,
And solitude, and gloom.

Yet many have I seen and see
As fair in face and mien;
But none, O none, that e'er to me
Can be what thou hast been!

Thy plighted faith, too deeply proved,
(Ah! who can love as thou hast loved?)
Stood firm, by woes or wrongs unmoved,
In darkest storms, serene.

But all is o'er; and that last hope,
But glimpse of happier doom,
Which urged me still with fate to cope,
Is wither'd in the tomb.
Yet would I spurn that vain redress
Which springs from cold forgetfulness,
Though love or joy should never bless
My dreary years to come.

Yet though thy form hath ceased to be,
Remembrance still is mine;
And though the cold turf cover thee,
My heart shall be thy shrine;
While earth, its cares and charms forgot,
Shall seem to me some desert spot,
Till in the sleep that dreameth not,
My head is laid by thine.

Meanwhile one thought shall soothe my breast,
Though all be dark beside,—
'Tis to believe that thou art blest
Where purer souls abide.
Then let me still, through suffering, strive,
As thou hast lived, sweet saint, to live;
Then may kind Heaven in mercy give
To die as thou hast died.

D.

A SEASONABLE RECOLLECTION.

"Remember Jesus Christ."

Memory, like every other endowment, becomes valuable only as it is properly employed. In this world we are comparatively unable to appreciate its worth. Here, at most, it has only the range of a few short years, a large proportion of the history of which does not deserve remembrance. It is a capacity which increases in importance as the history of our being advances. What a source of pleasure must memory be to a pure and happy being, who, by its aid, can call up the events which have given interest to ten thousand years! But it may be turned to the highest account even here. It is a casket; and if it contain "the pearl of great price," it is sacred, it is rich indeed.

In the present state our memory is weak and incapable, unable to contain but a small portion of the innumerable objects which claim a place in it. The part of wisdom, therefore, is to examine and select what should obtain the first admission, and occupy the most prominent place in it; that, as all cannot be remembered, ~~tricks~~ at least may not be received to the exclusion of important objects. Let such an examination be instituted, and, before and above all things, we shall remember Jesus Christ.

He deserves to be remembered for the moral splendour of his achievements, in vanquishing all the enemies of human happiness; for his unmerited kindness in remembering us in our low estate; for the strength and endurance of his love, in continuing his regard for us unabated, notwithstanding the slights he receives at our hands, and notwithstanding his own personal removal and exaltation and for the reward of grace which he promises to our remembrance of Him. They that remember Him, he will remember. And, oh! to be remembered by Him would amply compensate for being forgotten by all the universe besides! The dying malefactor only asked the Redeemer to remember him; and his humble request was answered with an assurance that, on that day he should be with Him in paradise.

Our remembrance of Christ must not be confined to the Sabbath, or the hour of prayer, or the day of death, when no aid but his can avail us. This would denote no great attachment to him; ~~this would be remembering him only when we could scarcely forbear doing it—when even they that hate him remember him.~~

Many would have us think about them, only when we ourselves are in prosperity. If we are in want, they would be pleased to find that we had forgotten them, lest we should importune or disgrace them. Not so Jesus Christ; he is pleased when our trials induce us to remember him: then it is that they answer their appointed end. In the hour of conscious guilt, his language is—"Remember my grace; it will prevent de-

spondency, and inspire you with hope." In the time of affliction—"Remember my sympathy, it will heal the wounds of the heart." In the season of duty—"Remember my example; like a guiding column of light, it will direct your course, and quicken your progress." In the prospect of death—"Remember that your 'Redeemer liveth,' and it will convert the chamber of sickness into the gate of heaven."

It is not easy for a man entirely to banish the Saviour from his recollections. Moving, as we are, in a world whose moral history is blended so intimately with the history of Christ, whose happiness depends on his mediation, and whose destiny will be determined at his tribunal, we are surrounded by intimations of his character and presence: and lest we should forget him, he has written his name more or less legibly on every object in the moral world—has left us, in a variety of forms, and in every direction, memorials of his merciful relations to us. Be it understood, however, that to remember him aright involves the noblest efforts of the human mind. The exercise is at once so easy, that it invites compliance; so arduous, that it demands supreme attention; and so indispensable, that to neglect it is to perish. It originates in a scriptural acquaintance with his character, and a devout affection for him; it implies our deepest sympathy with all that is pure and lofty; it renders us conversant with the beings and pursuits of another world. To remember him aright is to remember his promises, and believe them—his commands, and obey them—his glory, and to make it the object of our life.

There must be an intenseness in our recollections of him, which will not merely place him on an equality in our thoughts with other endeared objects, but which must give him a superiority above them all;—a remembrance which will yield us pleasure, which we shall often be disposed to indulge in as our highest gratification, and which, instead of readily giving way to other recollections, will keep its place in the mind, notwithstanding all the importunate solicitations of earthly objects. If we are not aiming at such a remembrance of Christ, we are recollecting him only as a being who deserves to be forgotten; but thus to remember him will impart a Divine character to a human mind—will make a sinful man a partaker of the Divine nature.

It has been said that a thought is valuable in proportion to the number of other thoughts which it naturally suggests. Then how valuable is the scriptural recollection of Christ! connected as he is with the past, the present, and the future, with all that is pure and spiritual, benevolent and great. In the universe, the Christian possesses in him a memorial and representative of

all that is worth remembering; while, on the other hand, every thought suggested by the contemplation of those objects may, in its turn, become the means of recalling the Saviour to his mind; and thus there will be an established connexion maintained in the mind between Christ and all that deserves to be associated with him. There will be a system of holy thoughts and recollections, of which Christ will be the centre and the soul: thoughts which at one time might have passed through the mind without being detained or cherished, will now find a welcome and a home; and will find it, simply because they bear a relation to him.

We listen with pleasure to the man who can give us the least information concerning a dear and distant friend; and every incident relative to Christ will be welcome to the heart which enshrines him. Could we look into the memory thus consecrated, and survey the interior imagery, we might trace with ease innumerable associations sacred to him, mingled, indeed, with some of an unhallowed kind; for even the temple itself was not unvisited by idols,

"Who durst fix their seats next the seat of God,
Their altar by his altar; yea, often placed
Within his sanctuary itself their shrines,
Abominations!"

But such sacrilegious thoughts will not find a welcome, or effect a lodgment, in a heart which is thus sacred to him. And this suggests the importance of vivid as well as frequent recollections of Christ. If they cease to be vivid, they cease to exert a practical influence. They mingle and pass through his mind with other thoughts; but, instead of controlling the man, they are controlled by him; instead of imparting a religious character to his mind, his mind imparts to them its own worldliness. This is the secret of the religious declension of many Christians from what the Scriptures designate their "first love." Instead of remembering *him*, they

come to be satisfied with merely remembering *past recollections* of him.

It is, no doubt, strange in the estimation of the world, to insist on the paramount importance of habitually remembering a Being so far removed beyond the range of our natural sympathies and associations. So, under the former economy, the heathens were at a loss to conceive what could be the object of the Jewish worship, since the temple contained no *image* of a god; and when at last, on the conquest of Jerusalem, they rushed into the "Holy of Holies," they exclaimed with amazement, that *there was no God!* We admit the difficulty of remembering an unseen Saviour, but affirm its practicability, and urge its importance, and exult in the pleasure which its performance involves.

If we desire to cherish the recollection of a distant friend, in order to prevent the possibility of long forgetting him, how often do we carry about with us some memento to awaken recollections of him! Now, though the Christian does not stand in need of such assistance, yet whatever is calculated to bring the Saviour properly before us should not be despised. There should be such a sensitiveness of feeling cultivated towards him, that every thing we hear and see should have a tendency to remind us of him. Our sacred mental associations should be so multiplied, that nothing could claim our attention without directly or indirectly leading us to him; that no train of thought could be excited within us, without terminating in thoughts of him; that as the magnetic needle turns in the direction of the pole, so, whatever our situation, our hearts, being imbued with his love, might spontaneously and habitually turn to him.

Pointing to his sacramental ordinance, he enjoins, "Do this in remembrance of me." The Christian should do every thing in remembrance of Christ, and thus convert life into one sacramental feast.

IDEAS AND IDOLS.

In their origin these two words are very closely related to each other. They are both formed from the Greek verb, which signifies "to see." There is, however, a distinction between them, to which it is of no small importance to attend; and there is a latitude of meaning in the radical word "see," to which it is equally necessary to pay attention, if we wish to think and speak correctly upon some of those subjects which concern us the most.

"The idea" is not so much the thing seen, as the fact of seeing it. This seeing, must not, however, be confounded with the mere use of the eyes in beholding the visible objects. It has a far more extensive signification than this, and applies with equal propriety to every subject

which can engage the human thought, whether that subject be of such a nature as can be visible to the eyes or not. Thus, for instance, we have an idea of the sound of a trumpet, the scent of a rose, or the flavour of a peach; and yet it would be quite absurd to speak of seeing any one of these. So, also, we may have a perfect idea of that which is to be done, or should be done, not only before it is carried into execution, but even though the execution of it should never be undertaken: and, under proper circumstances, it is our power of forming such ideas which enables us to make advances in knowledge, in the arts, in the business of life, and, in short, in every thing in which an advance can be made.

Philosophers, especially those who have endea-

voured to investigate the mental powers of man, and the means of their improvement, have often entangled themselves in a most complicated cobweb of words upon the subject of ideas; and they have done so, chiefly because they have confounded ideas with idols. Hence it is of the greatest importance to understand clearly the distinction of meaning between the two words. We have already said that the idea is not the thing perceived, but the fact of perceiving it; and that it applies to the perceptions of all the senses equally, and also to those mental perceptions, answering to which there are no objects of sense.

The word *idol* has a very different meaning, even when it has no allusion to those spurious religions in which idols are substituted in place of the true God. As the word *idea* comes from the active form of the verb to see, or rather from that of the more general word to perceive or have knowledge; so the word *idol* comes from the passive form of the same verb, and means the subject of the perception; which, however, may be either real or imaginary. Thus, for example, if we have with attention viewed a scene, a person, or any thing whatsoever, when we advert to it afterwards, it rises before us with the same clearness and truth as if it stood before our eyes in its natural reality. In this case we have both the idea and the idol. The idea is the power which we possess in our minds of calling it up; and the idol is that which answers to our call. Both may be either true to nature, or they may not; but if the one of them is true to nature, the other must be equally so. It is the idea, however, which controls and fashions the idol; and the idol is perfect or imperfect, just according as the idea is so.

This is a very important consideration; because the forming of a correct idea is that which distinguishes a person of intelligence from one of the opposite character; and, therefore, those who have the training of the minds of youth, which is a duty that devolves upon every parent, and, indeed, upon every one having more experience than those who are about them, whether they discharge it in a faithful manner or not, ought to be especially attentive to the right formation of those ideas. At the outset, they are chiefly acquired by observation, or through the medium of language; and the portion so acquired is the real materials out of which further experience and mental exercise may enable the party to arrive at something original—something which shall add to the real stock of knowledge.

The means by which this is to be done are exceedingly simple, probably too simple for the

ordinary modes of teaching, in which nothing will go down unless there is an air of artificial wisdom about it. We have only to study one thing at a time, and to study it thoroughly. First, as it is in itself, as a whole, in all its particulars, and in all its qualities; and, secondly, as it stands in relation to other things. The consideration of this relation is double, applying both to contemporary existence and to succession in time. In the first of these, we have to consider the subject of which we are endeavouring to obtain a correct idea, as a part of some system or other. It may be the system of nature, the system of art, or the system of human conduct; but, whether it is one or another of these, or two, or all of them jointly, the knowledge of the individual thing, however minute, is really of little value, unless we see it in its proper connexion. The relation of succession is not less important; because it is here that our belief in the doctrine of cause and effect, when grounded upon true principles, is so very valuable to us. The grand use of this doctrine consists in its enabling us to connect the future with the present, from the experience which we have of the connexion of the present with the past; and as the plan which we form with regard to the future is only an idea, it is necessary that the ground of our judgment of it, which is drawn from the past, should be true to the events as they have really happened. No human caution, and no exercise of judgment, can reach perfection in those matters; but still a very close approximation may be made by those who carefully examine all the circumstances of every passing event, in the issue of which they are likely at any time to be concerned, and diligently treasure them up in their memory. It is this mental faculty of seeing the end and the purpose of every thing projected, which, constituting what is usually called "common sense," or "mother wit," is so far superior to mere acquired learning, that an ounce of it is said to be worth a pound of the latter.

The formation of correct ideas, that is, mental apprehensions which reach the whole of any case, embraces the entire field of mental culture; and it is one which very strongly claims the attention of every rational being. But, even after this is done, there still remains a danger of error; namely, the misapprehension of idol or mental subject of the idea. It is distinctly to be understood that this idol is merely that which the mind perceives, and not any thing material; but we must defer the consideration of it to a future paper.

A CUP OF TEA.

{We have to apologize to our fair friends for introducing them to a bachelor's *l'été-à-l'été*, instead of to an orderly and mixed party. The latter we hope to do in a few weeks, having received an invitation for Thursday fortnight, and, contrary to our usual practice, accepted it, solely for the benefit of our readers. The gentleman who figures in the following article is, as will be seen, a mere bungler in the science of scandal, making mischief through a love of chattering, rather than from malicious intention. He hacks character as an Esquimaux would carve a turkey. In our future sketch we trust we shall be able to give a specimen of the more civilized mode of proceeding, and to exhibit the studied art and adroitness with which reputations are cut up in our tea-sipping circles, as skilfully as subjects at St. Thomas's Hospital.]

"Gossip, will you take a cup of tea with me this evening? Perhaps you belong to a Temperance Society; if so, it shall be tea and turn out. I am a bachelor, you know, and will invite no one else, that we may have it snug and cozy by ourselves. Well, you'll come? Thank you. Eight o'clock precisely. Good morning."

"Well, Mr. Gossip, how do you do again? I am glad to see you. Sit down. Have the kindness to ring the bell near you, and Sally will bring up the tray. The muffins were toasted half an hour ago, just as the clock struck eight; I like punctuality, Gossip; I like punctuality. I dare say something interesting happened to detain you thus long; yes—never mind—these things will happen. Don't apologize, I beg. You take cream and sugar? I hope you'll tell me if I don't make it agreeable."

"Well, Gossip, although I take tea in moderation, I confess it is a dangerous thing. Ardent spirits are mischievous, very; but tea also has a multitude of sins to answer for. The authority of Scripture, and the not unimportant fact that the decoction of tea-leaves was unknown till long after, prevents my attributing the origin of evil in Paradise to tea; but I am inclined to charge this beverage with most of the evil deeds which have been done of late years. Who can calculate the number of characters destroyed, reputations tarnished, friendships exploded, evil passions fostered, and amiable tendencies eradicated, by a cup of tea? Bellingham killed Mr. Perceval after tea; it was after tea (*gunpowder*, of course,) that the Cato-street conspirators held their meetings; murders, burglaries, highway robberies, and most of the blacker enormities, are committed at night, or, in other words, after tea. Effect follows cause,—crime follows tea; I think, then, Mr. Gossip, we may very logically infer that tea is the cause of crime. And further"—

"Pray, Scribble, do you know Mr. Tompkins?"

"I am not a talker, Gossip; but when my mind flings itself into the midst of a subject so sublime in itself, and awful in its results to mankind as tea, it revels and luxuriates like a hungry bull just turned into a field of clover. What an

infinity of interesting topics are associated with the word 'tea.' Think, Mr. Gossip, of that leviathan of nations, China, with its three or four hundred millions of inhabitants. Think of Confucius; think of all the great and learned men who flourished there before the time of Adam; think of its monstrous wall, its floating towns, its petrifying springs, its enormous lakes, with their beds, yielding crops and fruits to the cultivating hand of man; think of its wax-trees, tallow-trees, hashed rats, and puppy-pies. Think, too, of its pagan myriads,—Godless, Sabbathless! And contemplate, if your mind can grasp aught so magnificent, the scene which that mighty empire will present when the dense fogs of ignorance, superstition, and intolerance shall be rolled off like the morning mist, and the human desert shall blossom like the rose, beneath the fertilizing sun of Christianity. Think of"—

"Pray, do you know Mr. Tompkins?"

"Then think, Gossip, of that beautiful and ingenious home manufacture which has furnished us with the cups from which we are drinking. Let us travel in imagination to the human hive in which they were formed. What pounding, and moulding, and baking, and painting, and gilding, and varnishing! Let us glance at the condition, moral and physical, of the seventy or eighty individuals through whose hands they passed before they were ready for our use. Let us follow their aching backs and limbs to their bare and smoky hovels, or to the dens of drunkenness in which the excitement of toil is succeeded by the destructive excitement of intemperance and profaneness; where the body is inoculated with disease and premature decrepitude, and the mind converted to the semblance of a fiend; where the"—

"I heard the other day, Scribble, that Tompkins"—

"How exquisite the art, too, my dear Gossip, displayed in the production of this tray! To what perfection they have brought the manufacture of *papier maché*! how durable! how ornamental! The manufacturer now produces of this material almost all articles for household use, from the dining-table to the snuff-box. You may have your house furnished with paper, Gossip, from bottom to top, only excepting grates, poker, and tooth-picks. Admire the elegant form and delicate tints of that"—

"Mr. Tompkins is said to have"—

"The sugar, if you please, Gossip. Thank you. Let us contemplate a while the present state of the West Indies, and compare it with the past. What an awful"—

"I was going to tell you about Mr. Tompkins."

"The cream, my dear Gossip. Thank you. How wonderful is the process by which this is

converted from grass and buttercups into its present state! There are some things in the animal economy which "—

"My dear Sir, I "—

"Yes, very true; I forgot the spoons. Peru and Mexico are interesting, very interesting countries; but I think the silver mines there"——

"Mr. Scribble, this is not conversation; surely you fancy you are compiling an Encyclopædia. I have been trying to introduce a subject for the last half hour; and since it is not agreeable to you to allow me to say any thing, I must wish you good evening, and "——

"Nay, nay, my dear Gossip, sit down again, and take *your* turn. Let me fill your cup. Why, I declare, you have eaten all the muffins. Have the kindness to ring for more. Thank you. I *small* attention."

"You know Mr. Tompkins?"

"What Mr. Tompkins?"

"Mr. Tompkins of Gloucester-place."

"No; but I know his brother."

"Ah! it's a sad thing for all the family! Tompkins, you know, held power of attorney for old Gubbins; and I am told that, through some accidental inquiry at the bank, it was found—— but I don't like to state particulars; these are serious matters; suffice it to say, that Gubbins came to town, and Tompkins left London, the same day."

"What, for America?"

"No."

"France?"

"No, for Margate."

"Well, and what came of it?"

"O, he stayed a week or more, and then came back, looking as brazen as if nothing had happened. It was all hushed up, no doubt; but he'll never recover it."

"Well, Gossip, I hope the matter was not so bad as you suppose."

"My dear Scribble, I wish it may not have been."

"I met our old school-fellow Bill Smith the other day, Gossip."

"Did you speak to him?"

"Speak to him! to be sure I did, and laughed very heartily with him at the scrapes you used to get into by talking in school, and publishing *ricà voce* biographical sketches of old Thrashem and his family at the grocer's and at the tart-shop."

"I think neither of us must speak to him again, Scribble."

"Why? what's the matter?"

"I met him one morning coming into Regent-street, in the direct line from Great Marlborough-street; and the next day I read in the 'Times' newspaper that on that very morning William Smith was placed at the bar on a charge of swindling, and discharged on account of proof being defective, although it was the general im-

pression on the minds of those present that the accusation was not unfounded."

"But William is a common name, Gossip, and Smith not very uncommon."

"Ay, ay, Scribble; but I went to the office to make inquiries, and ascertained that the prisoner of that morning had nothing remarkable in his appearance, and was dressed in black, with crape on his hat, which proves his identity with our old crony, to whom the above description exactly applies, for Smith was in mourning when I met him."

"Well, I'll write to him, Gossip, and ascertain the fact, for *your* satisfaction."

"Not for the world. If you do, I shall consider it a breach of confidence. I detest scandal, and would not have the character of a tattler for the wealth of the universe. That's a serious business about poor Perkins, isn't it, Scribble? Who would have thought it? Such a retiring, even bashful, girl as his wife appeared to be when we first knew her! so respectably, and even piously, brought up too!"

"Yes, indeed."

"Well, I wish with all my heart there was a doubt, that she might have the benefit of it."

"What *has* she done, Gossip? murdered a company of grenadiers?"

"Worse than that, I fear. You must know Perkins left home one morning, saying that he should not return until late; but having been detained a shorter time than was expected, he found on his arrival—— But for his sake, poor fellow, I will not tell the sequel, especially as I was told the occurrence in confidence. You *know*, Scribble, I hate scandal, and cannot dwell with complacency on the vices and weaknesses of my fellow-creatures."

"O, your sensitiveness in that matter, Gossip, is proverbial. But do tell me how poor Perkins bears the shock."

"Strange to say, as if nothing had happened. I went there the other day just to take a cup of tea, make a few observations, and see if I could make peace and arrange matters between them; and, to my astonishment, found her smiling as sweetly, and him chatting as cheerfully, as usual."

"Awful insensibility, Gossip, most awful!"

"Yes, indeed. You remember Halls?"

"Remember! I know him intimately, if any one can know such a paradox as he is. A well-meaning fellow enough, I believe, very versatile, and somewhat eccentric; now gloomy as a bear with a bruised paw, casting the shadows of his constitutional melancholy over life and nature; moralizing on the past, the present, and the future, as if earth were but a huge burial-ground; full of whims and fancies, intense attachments, and vehement dislikes. With a mind now shrinking, like the sensitive plant, from contact with hostile intellect; yet, on occasion, wielding the tomahawk and the scalping-knife against all op-

posed to him. He is a strange fellow, Gossip; now shedding tears at an unkind word; anon offering defiance, ramping, ranting, and bellowing like a little bison; and the next moment extracting half a hundred bad jokes from half a dozen common-place words; laughing lustily, meanwhile, at his own nonsensicalities. O, I know him; but, Gossip, what murder has he committed?"

"He and Miss Jones"——

"An excellent and amiable girl that, Gossip."

"Yes, she is; pious without austerity, frank without forwardness, prudent without prudery, full of taste and feeling for literature, yet free from the slightest tinge of blisism; meek and sensitive, and"——

"She is all that you say, Gossip, and much more; but how has Halls treated her?"

"Why, he —— but"——

"Nay, Gossip, none of your pauses and buts, if you please. I am deeply interested in both; and, excuse me, I will know what was Halls' crime against Miss Jones."

"He offered to marry her."

"Horrible! most unnatural! Why, Gossip, the man's a monster."

"Very awful indeed. I know you can keep a secret, Scribble?"

"Almost better than yourself, Gossip."

"I think Jackson will soon be in the Gazette. I know a fact or two. 'Tis a sad thing, with his large family and sick wife. I was talking with Hopkins about it just before I came here. Hop-

kins has assisted him a good deal; and I thought it right to let him know his friend's situation, and the need he has of his further kind offices. I have mentioned it to nobody else; indeed I only heard it since dinner."

"Gossip, I am thunderstruck. The man owes me a thousand pounds. I must go to him instantly, and"——

"My dear Scribble, sit down, sit down, I beg; it may be a mistake, you know; besides, I told it you in confidence. I hate scandal, and would not have the character of a tattler for the world. Do sit down—there's a dear, kind, good fellow—and resume your highly-interesting conversation on China, the porcelain manufactory, *papier maché*, the West Indies, animal physiology, silver mines, and what not."

"Sit down! why, man, I am ruined. Sally, my great-coat. Ruined! perfectly ruined! Good night, Gossip—sorry to be obliged to turn you out so soon. I like you for your discretion and amiable disposition; you are so perfectly benevolent, that the affairs of others ever take precedence of your own in your regard. We are but two. We have been but an hour or two together; yet to how many of our friends have our thoughts been directed! towards how many have our kindest sympathies been drawn! How vastly might we have extended the circle of our beneficent contemplations, had we spent the whole evening together, and included a few ladies in our party! But being a bachelor, you know, Gossip,——Good night! good night!"

POETICAL REMAINS OF A STUDENT.

[The following poems are the remains of one in whom "the vision and the faculty divine" were stirring from earliest youth. He was one of the few who, like Keats, had his name written upon the water; like him, too, poetry was to him

"the food
Of his delighted fancy;"

and, like him, he died of that same insidious and dreary disease which, whilst it nurtures hope, only digs deeper the grave of open sorrow into which the victim of its misery is ever, sooner or later, hurried. These poems have been published before, but in a periodical of limited circulation, and known, perhaps, but to few of our readers.]

THE SONG OF THE SYREN.

I know thee, I know thee, thou fair-hair'd boy!
Thou art come to the land of light and joy,
To the home of each fair and lovely thing,
Where the bright flowers blow, and the sweet birds
sing,
Where the founts are clear as the skies above,
And the soft wind speaks like whisper'd love,
Where the violet breathes on the dawn-lit air
Of a spring that never dies,
And the asphodel shines as marble fair,
And the stars like woman's eyes,
Where the sunrise is bright as the sunset is calm,
And the silent midnight, from her couch of balm,
Heareth nought but the far stream's ceaseless hum;
To this home of delight have thy footsteps come.

I know thee, I know thee, thou fair-hair'd boy!
Thou art made for this land of light and joy:

The shrill, wild wind, and the lashing sea,
And the foundering skiff. O! it must not be.
Too bright are the treasured beams that lie
Hid in the depths of thy soft dark eye;
Too fair is thy cheek, and the soul too warm
That speaks through thy parted lips,
That lives in and looks from thy graceful form;
And the spirit of calm that sleeps
On the pearly white of thy wreathed brow,—
Too lovely are these, and too beautiful thou,
To brave the chill gale, and the salt sea foam;
No, no; thou art made for this island-home.

I love thee, I love thee, thou fair-hair'd boy!
And have waited thee long in this home of joy;
I have lean'd on the bare rock day by day,
From the purple-plumed dawn until gloomy grey;
And have wept when the far-seen sail grew dim,
Fading away from the water's rim.
Ah me! I could tell of the sleepless night,
Of the still deserted bower,
And the seaward gaze in the pale moonlight,
From yon lone and lighted tower:
But enough; thou art come, and my task shall be
To gather the honey-bee's gold for thee,
With sweets from the mountain, and sweets from the
well,
And others I could, but I may not tell.

I love thee, I love thee, thou fair-hair'd boy!
My home shall be thine in this land of joy.

I knew thou wert warm,—and thy couch have made
Of violet wreaths, 'neath the musk-rose shade,
Where the citron's scent, and the sound of the spring,
Are borne on the faint wind's fitful wing.
And O, far other delights than these:—

Heaven's music to lull thee to rest,
When thy form shall be lapp'd on a maiden's knees,
And thy head on her warm white breast;
Bright glances to meet, soft kisses to close
Thine eyes, when a moment they break their repose;
With none to disturb, and nought to alloy,
This home shall be thine, thou fair-hair'd boy!

LAMENT OF THE INDIAN WOMAN.

And art thou changed to clay?
Gone to the spirits' land, pale warrior-boy?
We mourn the fatal day
That saw thee rushing swiftly, and with joy,
To the dark forest where the ambush lay
That smote and left thee on the blood-stain'd way.

Thou wast our hope; we thought
To trust thy prowess when the foe should come;
And lo! thou'rt hither brought,
Borne in deep silence to thine earth-damp home,

With lips and locks that glow with beauty still,
And soft-closed eyes, and brow as marble chill.

Sleep, sleep, pale warrior-boy!

Thou in thy life didst love the moaning river,
And with strange, silent joy,
Didst watch the leaflets in the cool wind quiver:
Now shall that stream moan softly by thy bed,
And the light leaflet flourish o'er thy head.

He fell, but hath not ceased to be,—
His voice came on the blast,
And fearfully it spake to me
In thunder, as it past.

Son of the valiant dead, arise!
I hear the death-word spoken;
And I have sworn by him whose eyes
Behold when vows are broken.

Warriors! our fathers point the path,
Their spirits haunt the field;
His soul awakes their wildest wrath
Who stoops to shrink or yield.

REVIEW.

Sacred Philosophy of the Seasons: illustrating the Perfections of God in the Phenomena of the Year. Winter. By the REV. HENRY DUNCAN, D.D.,
Ruthwell. W. Oliphant and Son, Edinburgh.
1836.

Time is a solemn as well as a sounding title; and he who essayed to follow it out "in spirit and in truth," would have required to "gird up his loins like a man;" for the demand of the Almighty was upon him as strongly as it was upon the patriarch Job, when God called to him from the whirlwind, "I will demand of thee, and answer thou me." We fear we must add, that the reproof would fall still more forcibly upon the Rev. Pastor of Ruthwell than it did upon the man of Uz.

That Dr. Duncan has collected, from various sources, a number of interesting facts, we do not mean to deny; but still the title of his book is a misnomer, for we have searched it in vain for a single grain of philosophy. It more resembles the emptying of a sort of literary savings' bank, in which the laborious author had conserved scraps of all sorts, and poured the *mélange* upon the pages of a book, not only without plan and philosophical purpose, but actually without knowing the intrinsic value of the individual parts. Besides the total want of connexion and concentration upon any one general subject, which alone would render the book a mere lounging-book for the idle, there are some heavier charges for which Dr. Duncan is answerable. We will not of course go into the details of about ninety detached scraps of which the 394 pages are made up. We cannot, however, omit remarking in general, that the same objection applies to all that we have read, which applies to Paley, and every other writer professedly on Natural Theology, with the single exception, perhaps, of John Ray. The objection is in brief this:—There is neither nature nor theology in the matter, the scope of the whole being to show that in every kind of art the Almighty is a better artisan than human beings. Now what ought to be shown is, that the God of Revelation and the God of Nature are one and the same Being; and that the law of Nature and the law

of the Gospel are portions of one and the same general law, pure and perfect as the Lawgiver.

Upon this general point we ought to deal gently with Dr. Duncan, and not blame him for failing where far greater men have failed; but there is a minor point upon which we feel it our duty to admonish him, because, though he himself is possibly not aware of it, in our humble opinion it strikes directly at the doctrine of the immortality of the soul, and, by an injudicious attempt to raise other animals to the rank of man, tends to sink man to the level of the brutes. The passage to which we particularly allude begins on page 134, and has the very suspicious title of "Reason in the Lower Animals." We cannot afford to quote the whole; but the following passage, in the Doctor's remarks upon the quotations which it embodies, will show how dangerous it is to tamper with this subject:—

"In some of the insect tribes, there seems to be an extraordinary faculty, which, if it can be called instinct, surely approaches to the highest faculty possessed by man.—I mean the power of communicating information by some natural language. Huber affirms that, 'nature has given to ants a language of communication by the contact of their antennæ; and that, with these organs, they are enabled to render mutual assistance in their labours and in their dangers, discover again their route when they have lost it, and make each other acquainted with their necessities.' This power seems to be confirmed by what occurred to Dr. Franklin. Upon discovering a number of ants regaling themselves with treacle in one of his cupboards, he put them to the rout, and then suspended the pot of treacle by a string from the ceiling. He imagined that he had put the whole army to flight, but was surprised to see a single ant quit the pot, climb up the string, cross the ceiling, and regain its nest. In less than half an hour several of its companions sallied forth, traversed the ceiling, and reached the repository, which they constantly revisited till the treacle was consumed. The same power of communication belongs also to bees and wasps, as may be proved by any one who carefully attends to their habits.

"This is their language, not of articulate sounds indeed, but of signs—a language which, as Jesse observes, 'we have no doubt is perfectly suited to them; adding, we know not how much, to their happiness and enjoyments, and furnishing another proof that there is a God all mighty, all wise, and all good, who has 'ornamented the universe' with so many objects of delightful contemplation, that we may see Him in all his works, and learn not only to fear Him for his power, but to love Him for the care which He takes of us, and of all his created beings.

"Whether this power of communication be rational or instructive, it is obviously only suited to be useful to a being possessed, at least to a certain extent, of intellectual faculties,—of the power of forming designs,—of combining, with others, to execute

them,—of accommodating itself to circumstances, and, therefore, of remembering, of comparing, of judging, and of resolving. These are assuredly acts of reasoning; at least I know not under what other category to arrange them.

"The instance which Dr. Darwin gives of a wasp, noticed by himself, is in point. As he was walking one day in his garden, he perceived a wasp upon the gravel-walk with a large fly, nearly as big as itself, which it had caught. Kneeling down, he distinctly saw it cut off the head and abdomen; and then, taking up with its feet the trunk or middle portion of the body, to which the wings remained attached, fly away; but a breeze of wind, acting on the wings of the fly, turned round the wasp with its burden, and impeded its progress. Upon this, it alighted again in the gravel-walk, deliberately sawed off first one wing and then another, and, having thus removed the cause of its embarrassment, flew off with its booty.

"Here we have contrivance and recontrivance—a resolution accommodated to the case, judiciously formed and executed; and, on the discovery of a new impediment, a new plan adopted, by which final success was obtained. There is undoubtedly something more than instinct in this. And yet we call the wasp a despicable and hateful insect."—pp. 137, 138.

We must of course excuse what the Doctor quotes from Huber, Franklin, Jesse, and Darwin, though we

think the majority of these parties are very questionable authority on a profound question of a psychological nature, such as that which is here involved. To Darwin we should especially object, for we cannot forget having dipped into his "Zoonomia," which is not a beautiful poem, as some Edinburghers of late alleged it to be, but a piece of most unphilosophic prose. The grand objection, however, is to Dr. Duncan's own remarks, in the short paragraph which concludes the quotation. If what he alleges there be true, what can man possess more than is possessed by the wasp, unless it be a mere difference of material structure? Let the Doctor look at that paragraph again, and then let him consider how the scope of it is calculated to shake the better hopes of man; and then let him think what responsibility lies upon a preacher of that Gospel by which "life and immortality were brought to light," if he heedlessly tampers with such subjects.

GEMS.

"Man giveth up the ghost."

"'WHERE IS HE?'—Where, indeed! Look around you on the day when his death is announced, in the place where his life was passed—where is he? Seek him in the countenances of the neighbours: they are without a cloud—he is not there; the faces on which he has closed his eyes for ever, continue as cheerful as they were before. His decease is reported in the social circle; the audience receives it with indifference, and forgets it in haste; the seriousness with which it is told, or the sigh with which it is heard, springs rather from human pity than from moral reflection and social distress; and in a moment the current of convivial mirth recovers the liveliness of its glow; the business and the pleasures of the place proceed with their usual spirit; and perhaps in the house which stands next to that in which he lies an unconscious lump of clay, in the cheerless chamber of silence and insensibility, the voice of music and dancing is heard, and the roof resounds with jubilee and joy. Wait but a few days after his interment; seek him now in the faces of his kinsmen,—they have resumed their cheerfulness, now he is not there. When a few years have circled over his sepulchre, go search for the fugitive in his dark retreat from human notice; his very relics are vanished,—he is not now even there. Stay a little longer, and thou shalt seek in vain for a stone to tell thee in what part of the land of oblivion he was laid; even that frail memorial of him, of whatever materials it was made, has mouldered away: where, then, is he? The inspired penman assures us that he has given up the ghost: a singular expression, pointing out to us the sole prerogative of our nature. The death of other creatures is not announced in such terms as these. They literally cease to be; when they die, they become extinct; the animal life evaporates,

and the lump of matter of which they were formed insensibly crumbles into common dust. But man giveth up the ghost; he is at once subject and superior to death; he yields and vanquishes at the same moment; he alone, among all the beings which inhabit this lower world, must view with apprehensive terror, or joyous hope, the sieth of time and the dart of death; it is man's high privilege or dismal curse not to die; he departs, but whither—where is he? This is a question we ought seriously to ponder. It may be answered on the principles of the Christian revelation,—character is destiny, conduct is fate." We may probably resume the subject, and employ our best efforts to enable our readers to decide for themselves whether, as heirs of eternity, they are to be inhabitants of heaven or of hell. We have introduced the text of Scripture because it is seasonable, and may awaken solemn reflection and inquiry, and that we might more widely circulate an elegant passage from the sermons of the once-celebrated Joseph Fawcett.

CONTROVERSY is not in itself to be deprecated; it is only opposed to the highest interests of those who engage in it on the awful subject of religion, when it is conducted in a litigious spirit, for the purpose of serving a party, to gratify the pride of victory, or to obtain personal aggrandizement. Yet even when it has been most abused, it has ended in the clearer manifestation and ultimate triumph of right principles. Nothing is so apt to rouse attention, and to strike out knowledge, as disputes. In the beautiful language of Bishop Horne, "all objections, when considered and answered, turn out to the advantage of the Gospel, which resembles a fine country in the spring season, when the very hedges are in bloom, and every thorn produces a flower."—*Book of the Denominations.*

SAYINGS AND DOINGS.

ANAGRAM.—There is a comical story in the world of Sir Roger L'Estrange going to see Lee, the poet, when confined in a lunatic asylum. The poet expressing his concern to see his old friend in so dull a place, "Ay, sir," replied the other,

"Manners may alter, circumstances change,
But I am strange Lee still, you still Le Strange.

WAR.—Anthony Beneset, in a conference with the General Chevalier de Chastellux, said, "I know that thou art a man of letters, and a member of the French Academy. Men of letters have, for some time past, written many good things; they have attacked errors,

prejudices, and, more than all, intolerance; will they not at last try to disgust mankind with war, and make men live amongst each other like friends and brothers?"

LANDLORDS AND TENANTS.

Says his landlord to Thomas, "Your rent I must raise,

I'm so plaguily pinched for the pelf."

"Raise my rent!" replies Thomas, "your honour's main good,

For I never can raise it myself."

TEMPERANCE *VERSUS* INTEMPERANCE.

ARTICLE THE FIRST.

"Observe
The rule of not too much, by temp'rance taught."
MILTON.

TEMPERANCE is a bridle of gold; and he who never allows it to fall from his hand, *ego non summi viris comparo, sed simillimum Deo judico*, "is more like a god than a man;" for, having made the human-beast a man again, it contributes to heighten humanity into divinity.

In imagination I lately visited an *Association* of persons who, beginning to awake to the evils of intemperance, and resolved to forsake it, had assembled to devise expedients for aiding and confirming themselves in their good intentions. So true is it that we no sooner form a sincere resolution of amendment, than the beneficent God comes more than half way to our aid, that the company, on coming together, found the place of their meeting pre-occupied, and almost filled with preternatural incentives and encouragements to persevere.

These consisted, principally, of venerable personages of all ranks and times, who received them with looks of cheering complacency; and who, on uttering a sentence of caution or encouragement, slowly and successively withdrew. Many of the sentences so uttered I distinctly remembered to have read; and am convinced, from various circumstances which then transpired, that those who uttered them were their original and veritable authors, who, being dead, were thus allowed to speak.

The first, an eminently venerable man, placing his finger on a page of a book which he carried, read a passage which I recognised as Genesis ix. 20, &c.; and as he read, tears of penitence and looks of compunction, marked his patriarchal face. On the head of the next was the "likeness of a kingly crown;" and as he departed he pronounced, emphatically, "Wine is a mocker, strong drink is raging; and whosoever is deceived thereby is not wise." A train of ruddy and athletic men next walked forth, the personifications of health, followed by a majestic person wearing the prophetic vestments, who said to them, with an air of divine authority, "Thus saith the Lord of hosts, the God of Israel, Because ye have obeyed the command of your father, not to drink any strong drink, therefore shall he never want a man to stand before me for ever." Two others then departed in company; and as they went one of them said, in a tone of benignant entreaty, "Be not drunk with wine, wherein is excess." And the other instantly added, "For the drunkard shall not inherit the kingdom of God." Next went an aged man with his son, and pointing at him with delight, exclaimed, "This my son was dead and is alive again, he was lost and is found;

[No. 3. JAN. 18, 1837.—2d.] VOL. I.

rejoice with me." And the son knelt to receive his blessing.

Of those that followed most of them, instead of speaking, deposited a paper on the table, which was immediately opened and read by one or other of the company. The first was, *Ebrii gignunt ebrios*, and signed "Plutarch;" this the reader interpreted as, "one drunkard begets another." The next bore the subscription of "Tully," and was as follows, *Melior conditio senis viventis ex præscripto artis medica, quam adolescentis luxuriosi*, "better be a temperate old man than a free-living youth." The philosophers were followed by a train of kings and nobles, represented by a patrician of Venice, who laid on the table a book on the art of prolonging life, by Lewis Cornaro. These were succeeded by the poets, in whose name Shakspeare exclaimed,

"Ask God for temperance, that's the appliance only
Which your disease requires."

To which Milton added, with the sonorous voice of an organ,

"Observe
The rule of not too much, by temp'rance taught,
In what thou eat'st and drink'st; seeking from thence
Due nourishment, not gluttonous delight."

Statesmen, moralists, and preachers next disappeared, each depositing on the table, as he passed, some memento or sentence to the same effect as those which had preceded them. One of these was evidently by Camden, and stated that "the English, which, of all the northern nations, had been least drinkers, and most commended for their sobriety, learned, by the Netherland wars, to drown themselves with immoderate drinking; and, by drinking to others' healths, to impair their own:" leaving it to be inferred that, as the poisonous habit is not indigenous, but exotic, it may yet be eradicated.* Another was subscribed by the venerable name of "Hale," and ran thus,—
"If ever you expect to have a sound body, as well as a sound mind, carefully avoid intemperance. The most temperate and sober persons are subject to sickness and diseases, but the intemperate can never be long without them." A third bore the name of "Cecil, Lord Burghley," and contained the following: "Banish swinish drunkenness out of thine house, which is a vice

* There is no doubt whatever that excessive drinking was imported during the wars of the League, by our military men; that it was reduced to a science, regulated by laws, and attended by an appropriate dialect. "*Incredibile dictu*," as a Dutch writer of the time complains of his own countrymen, "*quantum hujusce liquoris immunda gens capit*," &c.; "it is incredible how much they will drink; how they love a man that will be drunk, crown him, and reward him for it."—*Bohemus in Saxonid*.

impairing health, consuming much, and makes no show. I never heard praise ascribed to the drunkard, but for the well-bearing of his drink ; which is a better commendation for a brewer's horse or a drayman, than for either a gentleman or a serving-man." "Temperance," said another, "that virtue without pride, and fortune without envy, gives ease of body and tranquillity of mind,—the best guardian of youth, and support of old age;" And to this was appended the name of "Temple."

But to proceed with the account of the incidents which took place after the reading of these and many similar sentences was ended ; the venerable assemblage having nearly all departed, the association now remarked, for the first time, that the walls of their room exhibited a number of devices relating to the subject under consideration. On one side appeared the brutal bacchana-

lian orgies ; on another, the drunken broil between the Centaurs and the Lapithæ ; here, Alexander, in the frenzy of intoxication, rushing on his friend Clytus ; and there, a squalid wretch dragged away by Disease and Remorse from a family perishing with want through his drunken habits. In one place, the apologue of the demon offering to his victim the choice of three sins, and smiling at his choice of drunkenness, well knowing that, when drunk, he would be ready to commit the other two ; and in another, a body in a state of spontaneous combustion ; whilst the whole of the upper part of the room was occupied by a representation of Temperance enthroned, crowned by a hand from the clouds, and surrounded and supported by groups of happy faces, denoting health, plenty, hope, honour, and religion.

THE HISTORICAL RECORDS OF THE BIBLE.

INTRODUCED by the kindness of a beneficent Creator into a state of existence, associated with beings like himself, and inhabiting a world which has undergone a variety of natural, moral, and political changes,—the man who does not feel an irresistible curiosity to inquire into the origin of the terrestrial globe, the nature and history of his species, with the whole train of events which has developed character, controlled the destinies of empires, and illustrated the great principles of the divine government,—has certainly little claim to the reputation of intelligence, goodness, or piety ; indeed, he scarcely deserves the name of man, for he is indifferent to the interests of humanity. Curiosity, however, is a very common, and a very powerful principle in the human breast, and, next to necessity, is the best incentive to the acquisition of important and useful knowledge ; the great difficulty is to guide, to restrain, and to satisfy it, to render it at once a source of gratification, and a means of improvement. Legitimate curiosity has to do, principally, with facts ; and it has been well observed, that facts are the reasons of philosophy, and philosophy is the glory of intellectual existence. The basis of right thinking, and of just principles, must be laid in an accurate and comprehensive acquaintance with the works and ways of God, with the transactions and affairs of men. And it is for this great purpose that we are favoured with the infallible records of the holy Scriptures : in them God himself has condescended to become our instructor, and to be our unerring guide through the labyrinths of the past ; leading us up to the first origin of things, and shedding light upon the gloomy and intricate path of inquiry. The Bible is, in truth, a great instrument of moral discipline, applied to man in his present state of probation ; and is chiefly intended to form his character as

an accountable creature, and thus to prepare him for a condition of immortal felicity.

In this holy book the Divine Being has used a variety of methods to teach us our duty, and to touch our hearts. Sometimes we read those plain and unequivocal precepts which declare his will ; and at other times we are instructed by an interesting parable : now we are allured by the voice of mercy, which sounds from Zion ; and then we are alarmed by the thunders which roll over Sinai : heaven is here unveiled to us, and we almost hear the harps of angels, and the hallelujahs of glorified saints ; hell is there uncovered, and the shrieks of the despairing vibrate on our ears, and the smoke of their torment rises before our eyes : here prophets look down the long current of years, and predict things which are to come ; there inspired historians show us the accomplishment of these predictions : here the merits of the Redeemer, and promises sealed with blood, are reached forth to us by our heavenly Father ; there the deep pollution of our hearts and the demerits of sin are developed to us. Every method is employed to bring back rebellious and wretched man to God and to happiness. The understanding, the heart, and the conscience are, by turns, addressed in language the most forcible, and by motives weighty as eternity. But the inspiring Spirit, well knowing our frame, well knowing how strongly we are stimulated by example, has especially chosen to communicate instruction to us from the lives of others. The greater part of the sacred volume is historical ; and the histories which it relates are not intended merely to excite a barren admiration, or to gratify an idle curiosity, but are designed and calculated to cherish the love and the fear of God, to teach us what he is and what we are, and to give new warmth to our devotional

feelings. Properly speaking, they are not so much the history of particular men or nations, as the history of God, of his nature, his perfections, his providence, and will, as exemplified in these particular instances; and therefore, when duly considered, they are eminently calculated to lead the heart and the affections to him. When the blighted beauties of Eden are presented to our eyes, it is not that our regrets may be excited from contrasting it with its former glory, but that we may be made to shudder at the guilt of sin, and tremble at the danger of disobeying the Most High. When we behold Noah riding on the back of the swelling surges, secure amidst the desolation of the world, it is our duty, not merely to rejoice at his personal deliverance; but to mark, also, the faithfulness of God, and the blessedness that results from believing his declarations and obeying his precepts. When we see the arm of Abraham extended, and ready to be dyed with the blood of his beloved son, we should not merely have our natural sympathies excited; but learn from him to sacrifice the dearest objects of our affections—those on which our souls rest with fondest delight—at the command of God. When the smoking ruins of Jerusalem are spread before us; when we behold the countless number of her children that became the victims of the sword, of famine, and of sedition; when we listen to the shrieks of the bereaved, and mark the convulsive struggles of the dying, it is not merely to fill our eyes with tears, and our hearts with sorrow, for this unhappy nation, that this picture is presented to us; but to show us the terrors of Jehovah, the woes which must crush the guilty when the patience of the Lord is exhausted, and his arm, clothed with thunder, is raised against them, and the accumulated misery which must at last overtake those who despise the means of grace and the offers of salvation. We are, perhaps, scarcely warranted in making the unqualified assertion, that there are no true histories except those which the holy Scriptures contain; though it is certain that the facts and characters which uninspired writers have given to the world were but imperfectly understood by themselves, and exhibited to others through the medium of their prejudices, predilections, and antipathies. It is not our privilege, in the present state, to view objects in their own light; we must altogether depend on the adventitious and uncertain glimmerings of human testimony; and what that testimony is worth must be estimated by the capacity and the integrity of the witnesses,—two things which are seldom united, even when men have actually beheld the events which they relate; and far less frequently when, in some distant age, individuals, ambitious of fame, aspire to distinguish themselves as historians; in these cases, so many motives, and influences, and sentiments combine to pervert judgment, and to blind integrity, that perhaps the

most finished labours of the historic muse deserve no higher character than that of splendid fictions. One thing is certainly obvious,—that the records of the sacred page, and the great scheme of Providence, in connexion with events which those records develop, afford the only true landmarks of history, and enable us to understand and to explain what would otherwise be obscure and unintelligible. In perfect harmony with this remark is the paragraph with which a devout historian concludes his great undertaking: “Whilst all things are in motion, and fluctuate upon earth; whilst states and empires pass away with incredible rapidity, and the human race, vainly employed in the external view of these things, are also drawn in by the same torrent, almost without perceiving it, there passes in secret an order and disposition of things unknown and invisible, which, however, determines our fate to all eternity. The duration of ages has no other end than the formation of the body of the elect, which augments and tends daily to perfection, and the final glory of which shall introduce a new era in the universe. ‘Then cometh the end, when he shall have delivered up the kingdom to God, even the Father; when he shall have put down all rule and all authority and power.’ God grant that we may all have our share in that blessed kingdom whose law is truth, whose King is love, and whose duration is eternity! *Fiat, fiat.*”

Attaching, as we do, such high and unrivalled importance to the sacred books, as themselves true histories, and the clue and only certain guide to the right understanding of all others, it may, perhaps, be demanded of us, how it is that there appears so little harmony and connexion in the narratives of these books; that they are written with so little order, and with so little regard to the disposition and combination of the parts; and that the whole should be pervaded with obscurity or confusion, with discrepancies or contradictions? Does not all this, it may be urged, imply a character of imperfection, of insincerity, and discordancy, which but ill agrees with the high pretensions of the Bible, as a divinely inspired and infallible communication from heaven?

In attempting to reply to these pertinent suggestions, which arise very naturally out of a superficial acquaintance with the sacred volume, I shall, at the same time, explain the nature and object of the present work, as well as prove the importance and value of the undertaking.

The complaint, that the historical Scriptures are destitute of harmony and connexion, that the narratives want continuity, and that, so far from flowing in one grand stream of uninterrupted events, they are irregular and abrupt, arises from two causes, neither of which forms a real objection against their truth or accuracy. The first, indeed, is a powerful argument in favour of both.

First—Let it be remembered, that what are called the histories of the Bible, were written by different individuals at distant intervals of time; that they did not write simply in the character of historians, but of legislators, prophets, teachers, and reformers; that their narratives are incidental portions of their works, and introduced for purposes of a moral and religious nature; that they are therefore interspersed with many things foreign to the express and exclusive object of history. All this will at once account for the want of an obvious connexion and harmony between them. Several of the sacred penmen relate the same facts, with circumstantial additions suited to the principal object which they wished to accomplish. But each one is always consistent with himself; and on a close investigation it will be found, that though the stream of narration is not preserved, yet, that the apparently separated rivulets are contributory to one grand reservoir of historical knowledge.

The books of Moses, though they contain jurisprudence, theology, poetry, and all that in his day were embraced in the circle of the sciences, yet present us with a consistent and harmonious history, occasionally broken and interrupted, and the chasms filled up with different materials; but affording undoubted evidence of design and connexion in the events and facts which he undertakes to perpetuate. "Where," says an authority of some weight on such a point as this, "Where can we find a more methodical history than that of Moses, beginning at the first creation of all things, and the formation of human kind; proceeding in the account of their increase, depuration, and almost total destruction by a universal deluge; after their second increase, relating their relapse into idolatry; and thereupon God's electing a peculiar people to serve him according to his own appointment, and so recording the first original, and various adventures of their progenitors; the afflictions and wanderings of that chosen nation; and the polity which they should observe when once they were settled in the promised land? Nothing can be more clear and regular than this: and as for the other historians, who wrote the transactions of the Jewish nation, from the conquest of Canaan to the Babylonish captivity, they are so exact in observing the order and series of time, and in setting down the length of each prince's reign, that they afford a better foundation for historical truth, as well as chronological certainty, than is to be found in the best heathen writers of this kind."

Should misapprehension still prevail on this subject, and an objection be felt against the scriptural records, because, in point of continuity, they differ so much from the classical specimens of this species of composition, we would just observe, that these records partake more of the character of *state papers* and *original documents*, which are the source of history, than of history

itself. A diligent inquirer may easily discern a connected series of events, by arranging in chronological order, and carefully bringing together the disjointed particulars which are preserved in these different and isolated *memoranda*. It is thus that the inspired books maintain the sacredness of their original character, and at the same time give full scope to the exercise of the human mind; and if persons of a doubting and sceptical spirit, would only investigate the records of the Bible with the same industry and acumen which they would deem it reasonable to apply to those ancient documents, which form the basis of civil history, they would remove all those obstacles to their faith which the apparent want of harmony and connexion in the sacred narratives may have occasioned.

The *second* cause which often perplexes the reader of the sacred books, and induces the hasty conclusion, that they have neither unity of design, nor consistency of parts is, the order, or rather disorder, in which they are thrown together. Here there is nothing like arrangement,—all is miscellaneous and accidental. Little regard has been paid by the compilers of the canonical books to their natural and proper disposition, and hence have arisen those difficulties and obscurities which have given birth to so many commentaries, and which are the foundation not only of infidel objections, but of numerous errors and mistakes among professing Christians. The great work of the learned Dr. Lightfoot was written for the express purpose of applying a remedy to this evil. Since his time, several biblical scholars have availed themselves of his invaluable labours, and made considerable advances towards perfecting his design. Mr. Townsend's late work, which is founded on the basis of Lightfoot's *Chronicle*, and in which the "Old Testament is so arranged that the books, chapters, psalms, prophecies, &c., may be read as one connected history in the words of the authorized translation," possesses very considerable merit, and removes every impediment to a clear and comprehensive understanding of the Scriptures. No man who reads this performance with care, and without prejudice, will have to complain that the Bible is either imperfect in its narratives, or disjointed in its parts.

With regard to the obscurities, confusion, and discrepancies which are charged upon the divine volume, it is sufficient to observe, that they also are imaginary; that they have no existence in the book itself, but are to be attributed, in some degree, to the causes already adduced; but more especially to the errors of translators and transcribers; to the very remote antiquity of the events recorded, as well as the great lapse of time since the accounts were written; to the customs and manners described, which were well understood by the persons addressed, but are by no means familiar to the mere English reader; to

the omission of various circumstances for the sake of conciseness in the narrative, which was yet sufficient to answer the design intended, but is now involved in a degree of obscurity, which the aid of collateral authorities and information supplied from other sources alone can remove; to the changes which revolving centuries have produced in the countries and nations that form the

principal scenes and subjects of sacred history, and to that kind of half biblical education which is picked up in a Christian and Protestant country, by multitudes, who understanding nothing perfectly, either of the sacred writers or their works, are forward to pass a presumptuous judgment upon both.

THE GIPSY.

A TALE.

SAMUEL PARKER was a fisherman, residing on the coast of Kent; that is to say, fishing was his ostensible, and had formerly been his actual and sole avocation. Of late years, however, Sam brought in fish only occasionally, and then seemed not particularly anxious about the disposal of them; nevertheless, his wife and children appeared usually to have all they wanted, and Sam, at all times, more than he needed, for he ever bore about with him, when on shore, symptoms of the free use of tobacco and spirits. It had long been more than insinuated in the neighbourhood, that he considered as fish all that came to his net, and that the majority of those which he now brought to land were of the *leg* species. Rumour in this instance said truly; Parker was a bold and an active smuggler.

One wintry afternoon, at the near approach of nightfall, the smuggler was proceeding to his cottage, when, on emerging from a small wood, he met a female gipsy who had long haunted the neighbourhood, making her appearance in the day-time, and retiring at night, nobody knew whither, for there was no encampment of her people near. She was never accompanied but by the infant which she carried at her back. She appeared to provide for her necessities by promising the maidens of the adjacent villages husbands; the young men wives; to fishermen prosperous voyages; to their dames good luck with their bees and poultry, or any little undertaking which they might have in hand; besides foreboding the dignity of alderman or parish beadle for their ragged-headed urchins.

She was by no means old, perhaps not more than thirty; yet her handsome, though strongly-marked countenance indicated a weight of care and sadness which would seem more naturally to belong to advanced years. In her air there was command almost amounting to dignity; but not derived from superior stature, for she was far from tall. She possessed the olive complexion, oval features, and dark massive locks characteristic of her tribe. Her eyes were black, large, and overflowing with subtle meaning; there was power, cunning, and a fearful fascination combined in them, as in those of the serpent. The twilight was just thickening into darkness; the wind was rising, and blew in fitful gusts among

the neighbouring branches; now sighing, wailing, moaning, and anon yelling and howling, like an angry demon. A man more imaginative and less besotted than Parker, would have felt the very poetical position in which he at that moment stood.

"Shall I tell your fortune, Master?" said the gipsy.

"No," said Sam, pettishly; "but I'll tell you yours without money. You will be sent to the tread-mill, vagabond; and very good exercise it will be for you. And that brat behind you, when he is old enough, thanks to what he will learn from you, will be swinging by the neck some day, for mistaking somebody's horse for his own, or doing something worse."

The eyes of the gipsy flashed fire; her whole countenance was irradiated with rage; her lips separated, exposing a double row of strong, white, regular teeth; guttural sounds proceeded from her throat, of which it was difficult to decide whether they were half-uttered words, or low scornful laughter. She seemed to be gathering and concentrating her energies, like a billow, in order to wreak them with greater certainty and fury.

"Villain!" at length she exclaimed, in a voice which rivalled the dissonance of the wind, and was heard distinctly above it. "Villain, do you threaten an unoffending woman, and a sucking babe, with the terrors of the law? *you*, who, like a beast of prey, prowl only amid darkness, not daring to bare your scoundrel visage to the sun; you who go forth on the ocean, not to fight your country's battles, or earn your bread by honourable toil, but to snatch it by base and cowardly stratagem; or skulk along the shore, starting and trembling as though in every blast you heard the clank of fetters; or, creep like a mole within the bowels of the earth, lest the eye of an honest man should rest on you!"

Parker's rage became uncontrollable; he aimed a sudden and desperate blow at the gipsy's head. With great dexterity she changed her position, and received but a slight portion of the injury intended. At an increased distance she poured forth a torrent of words with greater energy than before.

"Coward!" she continued, "women are your

fitting foes ; but you shall know that a woman's revenge is fatal. I know your secret caves, and dens, and passages ; they hide you not from my eye ; the waves cannot bear you where your actions are unknown to me ; the moonbeam cannot pierce where my agents cannot follow ; the winds that blow from every quarter do my errands and bring me tidings"—

These words, delivered in tones rising to preternatural pitch, were accompanied with vehement action ; her eyes glared through the darkness, her lips were ashy pale, and there was on them a thin surf of foam. Her manner had assumed a deep tinge of insanity. Abruptly abandoning her wilder strain, she continued, in a deeper, more earnest, and impressive tone, " I know your history well ; ay, every incident that you think securely locked in your own bosom. I could present to your eyes, as in a glass, your hideous past self ; but I forbear, and reveal to you, instead, the future. Yes, without silver or recompense of any kind, I will reveal to you your coming fate. Before a week is over and past, your heart, all base as it is, will pour out its life-blood, and earth contain one monster less !"

Although hardened by crime, and stupified by recent intoxication, Parker was not unshaken. The gipsy, as she finished speaking, glided into the wood. Long he looked in the direction in which she had disappeared ; and several times he thought he heard her voice, but was at length convinced that the sounds were but the moaning and hooting of the wind. He reached his home, not more sullen, but sadder than usual ; and it was not until the grog had flowed copiously, and the song had gone round among his comrades, that he forgot the adventure with the gipsy.

The next day the smugglers put to sea. On the fifth from that, a lugger was seen two or three miles from land ; she was the contraband trader, only awaiting the protection of darkness to run her cargo. The smugglers felt unusual security on this occasion, for they had received information from their spies on shore, that the nearest party of the preventive service were not at their station, and had not been seen during the preceding day. They therefore very naturally concluded that the force was on the watch for smugglers elsewhere. The kegs were landed, and deposited in a secret cavern, in order to their being removed the following night. Parker and the men who lived in the neighbourhood were about to extinguish the lights in their lanterns, and proceed to their homes, when, from a winding passage, by which the smugglers could, upon an emergency, make their way under ground to the thickest and most tangled part of the little wood already mentioned, a party of the coast-blockade men presented themselves, and, at the same instant, a larger body from the beach hemmed in the smugglers on that side. The latter were called on to surrender ; but, in-

stead of doing so, they drew their cutlasses, and examined the priming of their pistols. A pistol was discharged,—another,—and another ; the fight speedily became general ; it was a moving battle, and took a direction towards the sea, probably from an instinctive desire in the minds of both parties for the open space, free air, and star-light of the beach. Parker, at this instant, stood at the inner end of the cave, with his back to the receding fight, and two armed foes opposed to him. One he cut down with his cutlass ; his pistol was cocked and pointed, with exact aim, at the breast of his remaining antagonist,—the only obstacle between him and the narrow subterranean passage to the wood ; his finger was on the trigger, when a shrill sound echoed through the cave. Parker, apparently arrested by some vague fear, unconsciously lowered his pistol-hand, turned his head in the direction whence the voice proceeded, and beheld, bounding towards him from the thickest of the deadly contest,—the gipsy !

He had thus placed himself in the power of his adversary, who seized his advantage, sprung forward, and plunged his cutlass into the bowels of the smuggler. The latter fell to the earth, and the undischarged pistol was jerked from his hand two or three paces, by the shock. The gipsy sprang to his side, uttering a shout of derisive laughter, which, echoed as it was from the roof of the cavern, gave the idea of the ironical yell of a fiend. The wounded man raised to his persecutor a scowling look of mingled rage and fear. With a desperate effort he hurled himself some inches towards the still loaded pistol ; a torrent of blood from his gaping wound was the consequence, and he sank on his arm, faint and exhausted by the exertion. A louder and a shriller shout arose from the lips of the gipsy.

Parker's attention was now attracted by the approach of Williams, the chief of the band ; who was led by his captors back into his cave, bound and bleeding, but, apparently, not severely wounded. He bent towards Parker, and they shook hands in silence. The whole formed a picturesque group,—the mortally wounded smuggler ; his leader and comrade wounded too, and a captive ; the gipsy, her black tresses floating on the current of air which swept through the cavern, every feature kindled with fervour, and contorted with passionate triumph ; her infant, unconscious of the strife of deadly weapons and fiendish human passions, sleeping at her back ; three or four of the victors, some slightly wounded, all wearied with exertion or excitement, standing or leaning around. These, with a background formed by the sandy beach, on which groups of combatants were yet struggling ; the vast moaning ocean, and an illimitable arch of pale blue sky, studded with stars, were a subject worthy of the contemplation of the poet or of the painter.

The life of Parker was evidently fast ebbing. He fixed his eyes on Williams, and exclaimed, convulsively, "My wife! my poor wife!" "Ha! ha! ha!" exclaimed the gipsy, stepping nearer to him; "yes, thanks to what you have taught her, and the destitution in which you leave her, she will soon find her way to a goal, or be sent to the tread-mill; and very good exercise it will be for her. Ha! ha! ha!"

The eyes of the dying man were withdrawn from his friend to the gipsy, and then closed, as if in despair. A minute or two elapsed, after

which, like the flame of an expiring taper, life seemed to make another effort: fixing his hazy eyes again on his comrade, Parker exclaimed, "My children! O, my children!" "Yes," shouted the hag, with a terrific scream of delight; "yes, thanks to what you have taught them, they will all be swinging by the neck some day. Ha! ha! ha!—ha! ha! ha!"

The dying man turned his eyes, which were now becoming fixed and glassy, on the spot lately occupied by the gipsy—she was gone.

N.

WILLIAM WORDSWORTH.

We have heard it frequently remarked, by those whose talents and acquirements have led them to the perusal of the best works of the modern poets of England, that the poetry of William Wordsworth would never become popular; that his verse would be forgotten if once read; and that the sentiments he embodied in his poetry were decidedly adverse to those which have ever given to the poems of Scott and Byron, the loftier meed of national praise and popularity. We could go most fully into the subject, and prove the complete fallacy of such an assertion; but the most decided proof and sign that the poetry of Wordsworth is, and ever will be, read, and that his popularity as a great writer is on the increase, is made most clearly evident from the circumstance, that he has published, within the last year, the sweet volume of "Yarrow Revisited;" and that we have now lying before us the two earlier volumes of a complete series of his works.

William Wordsworth! what a glorious name is that! and what a world of serene and happy contemplation of the beautiful in nature is associated with it! The poetry of this gifted author has ever been read and understood by the pure and enthusiastic lovers of that art which beautifies and intellectualizes the visible world of creation around us, and lifts us up, in dreams and visions, from the golden thrones of earthly kings to the regions of the highest heaven, amid principalities, and powers, and spirits of a vast and eternal dominion. Yet though his poetry may lead us up into the realms of a more sublime and lofty imagination, he does yet throw the gleams of a rich and brilliant fancy over the low and humble features of personal life, as he sees it at the cottage door, or the flowery well-side of the humble and happy dwellers around the Rydal Mount. On this point of criticism we may quote his own most appropriate words, when he says, that "the imagination not only does not require for its exercise the intervention of supernatural agency, but that, though such agency be excluded, the faculty may be called forth as imperiously, and for kindred results of pleasure, by incidents within the

compass of poetic probability in the humblest departments of daily life." And how beautifully does he thus link the harsher rudiments of this rule in prose, with the sweeter breathings of gentle poesy, when he sings of

A simple child

That lightly draws its breath,
And feels its life in every limb,
What should it know of death?

I met a little cottage girl,
She was eight years old, she said;
Her hair was thick, with many a curl,
That clustered round her head.

She had a mystic woodland air,
And she was wildly clad;
Her eyes were fair, and very fair;
Her beauty made me glad.

We have always considered this beautiful apparelling of the lowly and the humble in the garments of poesy, this lifting up of the meek-hearted and contrite dweller in the lonely valley and the silent woods, to be one of the great and powerful characteristics of Wordsworth's poetry. In the poems referring to the period of childhood, there are the hopes and fears belonging to these Eden hours of life, expressed in many rich stanzas of soft and touching warm-heartedness. The natural affections of the human heart thrill sweetly, as to the delightful sound of tenderest music, when he thus addresses a child six years old:—

O blessed vision! happy child!
That art so exquisitely wild,
I think of thee with many fears,
For what may be thy lot in future years.

O, too-industrious folly!
O, vain and causeless melancholy!
Nature will either end thee quite,
Or, lengthening out thy season of delight,
Preserve for thee, by individual right,
A young lamb's heart among the full-grown flocks.
What hast thou to do with sorrow,
Or the injuries of to-morrow?
Thou art a dew-drop which the morn brings forth,
Ill fitted to sustain unkindly shocks,
Or to be trilled along the cooling earth;

A gem that glitters while it lives,
And no forewarning gives;
But at the touch of wrong, without a strife,
Slips in a moment out of life.

Or how is the same sentiment breathed over
again, chastened, though it be, by a sad beguil-
ing sorrow —

She dwelt among th' untrodden ways,
Beside the springs of Dove,
A maid whom there were none to praise,
And very few to love;

A violet by a mossy stone,
Half hidden from the eye;
Fair as a star when only one
Is shining in the sky.

She lived unknown, and few could know
When Lucy ceased to be;
But she is in her grave, and, O,
The difference to me!

In all these gentle strains, there is embodied the natural breathings of the happiest and softest affections of the heart; the joyous wish, and the saddening reflection, are all mutually blended together in one sweet undersong of tenderest lamentation. There is no repining at the cares and anxieties of life; no jarring discord at the intrusion of that sickening sorrow which mortifies and abases the rising pride and boasted greatness of the worldling into the dust; but every pain and pang of mind or body are met with the spirit of a pure and humble resignation, derived from the lonely study and the peaceful contemplation of the inner workings of the mortal mind, and the external development of the solemn loveliness and grandeur of nature. In support of this, let us refer the reader to the "Lament of Mary Queen of Scots," "The Last of the Flock," and "The Affliction of Margaret;" which latter, in itself, enshrines all the feelings of a young mother yearning for a lost child, and mutely sorrowing in the depths of penitential affliction. So many are the mirrored sentiments and feelings of the heart depicted by this gifted author, and which we must quote, that the readers of the "Miscellany" may strictly understand the truth and force of our remarks,—that we have only room for some of the concluding stanzas from this latter beautiful poem.

Alas! the fowls of heaven have wings,
And blasts of heaven will aid their flight;
They mount—how short a voyage brings
The wanderers back to their delight!
Chains tie us down by land and sea;
And wishes, vain as mine, may be
All that is left to comfort thee.

Perhaps some dungeon hears thee groan,
Maimed, mangled by inhuman men;
Or thou, upon a desert thrown,
Inheritest the lion's den;
Or hast been summoned to the deep,
Thou, thou and all thy mates, to keep
An incommunicable sleep.

I look for ghosts; but none will force
Their way to me:—'tis falsely said
That there was ever intercourse
Between the living and the dead;
For, surely, then I should have sight
Of him I wait for day and night,
With love and longings infinite.

My apprehensions come in crowds;
I dread the rustling of the grass;
The very shadows of the clouds
Have power to shake me as they pass:
I question things, and do not find
One that will answer to my mind;
And all the world appears unkind.

Beyond participation lie
My troubles, and beyond relief:
If any chance to heave a sigh,
They pity me, and not my grief.
Then come to me, my son, or send
Some tidings that my woes may end;
I have no other earthly friend!

We question whether the most industrious searcher after the pathos of the affections would find any poem wherein those feelings were so exquisitely combined as in this beautiful lamentation. The moaning of some imprisoned bird sighing for freedom—the crushing suspense of anxiety and sorrow—the nervous and agitated trembling of the spirit, depicted with such fearful strength and power in the four first stanzas—the summing up of a mother's heartfelt prayer—and the tender and touching appeal to the lost or wandering son, in the last lines, are such as will strike to the heart of the most careless reader. It is a requiem sung by a mourning mother, and consecrated therefore to the holiest affections.

But we have now to speak of those poems which have attracted the more noted attention of those who have looked up to Wordsworth with the affection of sons and students—who have dwelt upon, and lingered over, those finer and richer beauties of the mental worlds of thought, fancy, and imagination, which they display in such rich and pre-eminence abundance. In the beautiful tale of "Vaudracour and Julia," he has given the record of two beings who

From their cradles up,
With but a step between their several homes,
Twins had they been in pleasure; after strife
And petty quarrels had grown fond again;
Each other's advocate, each other's stay;
And, in their happiest moments, not content
If more divided than a sportive pair
Of sea-fowl, conscious both that they are hovering
Within the eddy of a common blast,
Or hidden only by the concave depth
Of neighbouring billows from each other's sight.

Vaudracour loves in his earlier years, and, entranced by the spells of the young affections of his heart,

He beheld
A vision, and adored the thing he saw.
Arabian fiction never filled the world
With half the wonders that were wrought for him.
Earth breathed in one great presence of the spring;
Life turned the meanest of her implements,

Before his eyes, the price above all gold ;
The house she dwelt in was a sacred shrine ;
Her chamber window did surpass in glory.
The portals of the dawn ; all paradise
Could, by the simple opening of a door,
Let itself in upon him :—pathways, walks,
Swarmed with enchantment, till his spirit sank,
Surcharged, within him, overblest to move
Beneath a sun that wakes a weary world
To its dull round of ordinary cares ;
A man too happy for mortality !

They are separated, and after a long and vigilant search united again, but only for a few brief moments—that in sweet love-time make so many years ; they depart, Vaudracour resolving

A sacrifice of birthright to attain
A final portion from his father's hand ;
Which granted, bride and bridegroom then would flee
To some remote and solitary place,
Shady as night, and beautiful as heaven,
Where they may live, with no one to behold
Their happiness, or to disturb their love.

But, alas ! this golden dream was formed but to be broken : Vaudracour's father sets three hired braves to seize his son, and for the murder he commits on one, he is thrown into prison. Julia is sent to a convent, lingers, pines, and dies. Vaudracour at the termination of his sentence retires to a lonely dwelling, amid whose

Solitary shades
His days he wasted, an imbecile mind !

The "Idiot Boy," "Michael," "The Armenian Lady's Love," and "The Prioress's Tale," are all examples of the same high standard of refined poetry and sentiment with the above which we have given. In those beautiful selections of verse, in which he, by a theory peculiar to minds of deep and excessive contemplation, has given wings to the waifings of a pure and delighted "fancy," there are many sweet and gentle songs, which we must from want of room pass over ; merely naming some few by name, and quoting others of most touching and tender sentiment, which embody in their very echoes all that is meek and lovely in the thoughts springing up within and around us in the natural and moral worlds. "The Waterfall and the Eglantine," "The Oak and the Broom," "The Seven Sisters," and "The Pilgrim's Dream," are of the number of these. The following we quote, selecting some stanzas from the two first, and giving the two latter entire.

TO THE DAISY.

In youth from rock to rock I went,
From hill to hill in discontent,
Of pleasure high and turbulent,
Most pleased when most uneasy ;
But now my own delights I make,—
My thirst at every rill can slake,
And nature's love of thee partake,
Her much-loved daisy !

Thee Winter in the garland wears
That thinly decks his few grey hairs ;
Spring parts the clouds with softest airs,
That she may sun thee ;

Whole Summer-fields are thine by right ;
And Autumn, melancholy wight !
Doth in thy crimson head delight
When rains are on thee.

In shoals and bands, a morrice train,
Thou greet'st the traveller in the lane,
Pleased at his greeting thee again ;
Yet nothing daunted,
Nor grieved if thou be set at naught ;
And oft alone, in nooks remote,
We meet thee, like a pleasant thought,
When such are wanted,

If to a rock from rains he fly,
Or, some bright day of April sky,
Imprisoned by hot sunshine, lie
Near the green holly,
And wearily at length should fare ;
He needs but look about, and there
Thou art !—a friend at hand, to scare
His melancholy.

A hundred times, by rock or bower,
Ere thus I have lain couched an hour,
Have I derived from thy sweet power
Some apprehension,
Some steady love, some high delight,
Some memory that had taken flight,
Some chime of fancy, wrong or right,
Or stray invention

* * * * *

A little Cyclops, with one eye
Staring to threaten and defy,
That thought comes next—and instantly
The freak is over,
The shape will vanish—and, behold !
A silver shield with boss of gold,
That spreads itself, some fairy bold
In fight to cover.

I see thee glittering from afar,
And then thou art a pretty star ;
Not quite so fair as many are—
In heaven above thee ;
Yet like a star with glittering crest,
Self-poised in air thou seemest at rest :
May peace come never to his nest
Who shall reprove thee !

Bright flower ! for by that name at last,
When all my reveries are past,
I call thee, and to that cleave fast,
Sweet, silent creature !
That breath'st with me in sun and air,
Do thou, as thou art wont, repair
My heart with gladness, and a share
Of thy meek nature.

TO THE SMALL CELANDINE.

PANSIES, lilies, kingcups, daisies,
Let them live upon their praises ;
Long as there's a sun that sets,
Primroses will have their glory ;
Long as there are violets,
They will have a place in story :
There's a flower that shall be mine,
'Tis the little celandine.

* * * * *

Ere a leaf is on a bush,
In the time before the thrush
Has a thought about her nest,
Thou wilt come with half a call,
Spreading out thy glossy breast
Like a careless prodigal ;
Telling tales about the sun,
When we've little warmth or none.

Drawn by what peculiar spell,
By what charm for sight or smell,
Do those winged dim-eyed creatures,—
Labourers sent from waxen cells,—
Settle on thy brilliant features,
In neglect of buds and bells
Opening daily at thy side,
By the season multiplied ?

Comfort have thou of thy merit,
Kindly, unassuming spirit !
Careless of thy neighbourhood,
Thou dost show a pleasant face
On the moor, and in the wood,
In the lane ; there's not a place,
Howsoever mean it be,
But 'tis good enough for thee.

Prophet of delight and mirth,
Ill-requited upon earth,
Herald of a mighty band,
Of a joyous train ensuing,
Serving at my heart's command,
Tasks that are no tasks renewing,
I will sing, as doth behove,
Hymns in praise of what I love.

* * * * *

Often have I sighed to measure
By myself a lonely pleasure,
Sighed to think I read a book
Only read, perhaps, by me ;
Yet I long could overlook
Thy bright coronet, and thee,
And thy arch and wily ways,
And thy store of other praise.

Blithe of heart, from week to week
Thou dost play at hide-and-seek ;
While the patient primrose sits
Like a beggar in the cold,
Thou, a flower of wiser wits,
Slip'st into thy sheltering hold ;
Bright as any of the train
When ye all are out again.

Thou art not beyond the moon,
But a thing "beneath our shoon :"
Let the bold adventurer thrid,
In his bark, the polar sea ;
Rear who will a pyramid ;
Praise it is enough for me,
If there be but three or four
Who will love my little flower.

THE DANISH BOY.

A FRAGMENT.

I.

BETWEEN two sister moorland rills
There is a spot that seems to lie
Sacred to flowerets of the hills,
And sacred to the sky.
And in this smooth and open dell

There is a tempest-stricken tree ;
A corner-stone by lightning out,
The last stone of a lonely hut !
And in this dell you see
A thing no storm can e'er destroy,—
The shadow of a Danish boy.

II.

In clouds above the lark is heard,
But drops not here to earth for rest ;
Within this lonesome nook the bird
Did never build her nest.
No beast, no bird, hath here his home ;
Bees, wafted on the breezy air,
Pass high above those fragrant bells
To other flowers,—to other dells
Their burthens do they bear ;
The Danish boy walks here alone ;
The lovely dell is all his own.

III.

A spirit of noon-day is he ;
Yet seems a form of flesh and blood ;
Nor piping shepherd shall he be,
Nor herd-boy of the wood.
A regal vest of fur he wears,
In colour like a raven's wing ;
It fears not rain, nor wind, nor dew ;
But in the storm 'tis fresh and blue
As budding pines in spring ;
His helmet has a vernal grace,
Fresh as the bloom upon his face.

IV.

A harp is from his shoulder slung,
Resting the harp upon his knee ;
To words of a forgotten tongue,
He suits its melody.
Of flocks upon the neighbouring hill
He is the darling and the joy ;
And often, when no cause appears,
The mountain-ponies prick their ears
— They hear the Danish boy,
While in the dell he sits alone
Beside the tree and corner-stone.

V.

There sits he ; in his face you spy
No trace of a ferocious air,
Nor ever was a cloudless sky
So steady or so fair.
The lovely Danish boy is blest
And happy in his flowery cove ;
From bloody deeds his thoughts are far ;
And yet he warbles songs of war,
That seem like songs of love,
For calm and gentle is his mien ;
Like a dead boy he is serene.

ADDRESS TO MY INFANT DAUGHTER.

Hast thou then survived —
Mild offspring of infirm humanity,
Meek infant ! among all forlornest things
The most forlorn—one life of that bright star
The second glory of the heavens ?—Thou hast,
Already hast, survived that great decay,
That transformation through the wide earth felt,
And by all nations. In that Being's sight
From whom the race of human kind proceed,
A thousand years are but as yesterday ;
And one day's narrow circuit is to Him
Not less capacious than a thousand years.

But what is time? What outward glory? Neither
 A measure is of Thee, whose claims extend
 Through "heaven's eternal year."—Yet hail to Thee,
 Frail, feeble monthling!—by that name, methinks,
 Thy scanty breathing time is portioned out
 Not idly.—Hadst thou been of Indian birth,
 Couched on a casual bed of moss and leaves,
 And rudely canopied by leafy boughs,
 Or to the churlish elements exposed
 On the blank plains,—the coldness of the night,
 Or the night's darkness, or its cheerful face
 Of beauty, by the changing moon adorned,
 Would, with imperious admonition, then
 Have scored thine age, and punctually timed
 Thine infant history, on the minds of those
 Who might have wandered with thee.—Mother's love,
 Nor less than mother's love in other breasts,
 Will, among us warm clad and warmly housed,
 Do for thee what the finger of the heavens
 Doth all too often harshly execute
 For thy unblest coëvals, amid wilds
 Where fancy hath small liberty to grace
 The affections, to exalt them or refine;
 And the maternal sympathy itself,
 Though strong, is, in the main, a joyless tie
 Of naked instinct, wound about the heart.
 Happier, far happier is thy lot and ours!
 Even now—to solemnize thy helplessness
 And to enliven in the mind's regard
 Thy passive beauty—parallels have risen,
 Resemblances, or contrasts, that connect
 Within the region of a father's thoughts
 Thee and thy mate, and sister of the sky.
 And first;—thy sinless progress, through a world

By sorrow darkened and by care disturbed,
 Apt likeness bears to hers, though gathered clouds,
 Moving untouched in silver purity,
 And cheering oft-times their reluctant gloom.
 Fair are ye both, and both are free from stain:
 But thou, how leisurely thou fill'st thy horn
 With brightness! leaving her to post along,
 And range about, disquieted in change,
 And still impatient of the shape she wears.
 Once up, once down the hill, one journey, Babe,
 That will suffice thee; and it seems that now
 Thou hast fore-knowledge that such task is thine;
 Thou travellest so contentedly, and sleep'st
 In such a heedless peace. Alas! full soon
 Hath this conception, grateful to behold,
 Changed countenance, like an object sullied o'er
 By breathing mist; and thine appears to be
 A mournful labour, while to her is given
 Hope, and a renovation without end.
 — That smile forbids the thought; for on thy face
 Smiles are beginning, like the beams of dawn,
 To shoot and circulate; smiles have there been seen;
 Tranquil assurances that heaven supports
 The feeble motions of thy life, and cheers
 Thy loneliness; or shall those smiles be called
 Feelers of love, put forth as if to explore
 This untried world, and to prepare thy way
 Through a strait passage, intricate and dim?
 Such are they; and the same are tokens, signs,
 Which, when the appointed season hath arrived,
 Joy, as her holiest language, shall adopt,
 And reason's godlike power be proud to own.

EPHON.

VALLEY OF THE AMAZON.

It is our anxious desire to bring before the readers of the "Miscellany" every species of information which is calculated to make them wiser and better, to make the present world full of rational enjoyment, and the future world rich in hope. In order to carry this properly into effect, we must devote no inconsiderable part of our early numbers to the laying of sure foundations. We do this advisedly, and with the fullest conviction on our minds that many well-intentioned periodicals have failed in producing that effect which they probably wished to produce, not from the building of structures which were in themselves fair withal to look upon, but from the said structure being founded on the sand. This we have seen, and this we shall endeavour to avoid. We can, of course, do little upon any one subject in a single number, because the name of our subjects is "Legion." But we ourselves are not few, neither are we unknown to the world; and therefore we hope to do good, and to find our reward in the cordial approbation of an instructed and grateful public.

In taking natural subjects, or events in the history of the human race, there is one sort of artificial memory which wonderfully abridges the labour of knowing, and increases the facility of remembering: this consists in what may be technically called "mapping;"—making the map of the world, whenever we cast our eyes upon any

part of it, instantly render up all of nature or all of the story of man which it has to reveal.

The simplest way of doing this, is to take the valleys of the rivers. The river is the source and centre of fertility, the means of inland communication, and the grand attraction for human beings, as best adapted for supplying plenty of food, and promoting that intercourse by means of which man improves man, "as iron sharpeneth iron."

The most splendid river on the surface of our globe is unquestionably the Amazon, which mingles its waters with the Atlantic tide almost directly under the equator. It may be possible that the Mississippi, in North America, discharges an equal, or perhaps a superior quantity of water; but the Mississippi is, for great part of its course, smouldering in the ruins which its own violence has made. Its immediate banks are, in many places, unprofitable bluffs of sand; while behind these there are miles and miles of pestilential marshes, rank with the most deadly effluvia, and tenanted by the most loathsome reptiles.

The Amazon, mighty as it is, partakes of none of those characters. It rolls its mighty flood silently to the sea; and ship or shallop may proceed with perfect safety, upwards or downwards, upon it, for more than two thousand miles, without the slightest interruption of either rock or rapid.

Then its branches partake of much of the

majesty of rivers of the first class; and the greater number flow through countries where nature displays the utmost exuberance of its bounty. Taken on the straight line, the source of the river Madera, in Bolivia, not far from the once-celebrated Potosi, is fifteen hundred miles to the southward of the confluence of the Amazon with the Atlantic; and the Araguay, in the western part of Brazil, rises in latitudes nearly as far to the south. The northern affluents of this mighty river are of smaller dimensions and of shorter course; though one of them, the Negro, rising in Northern Peru, not far from Popian, is equal to at least a dozen of the river Thames. Considering these circumstances, which we have underrated rather than exaggerated, it may with truth be said that, taking it on the straight line—which, of course, is less than the absolute extent of the river,—the valley of the Amazon, in one continuous portion of the most fertile surface of the earth, is more than two thousand miles long, and fifteen hundred miles broad. It thus contains not less than three millions of square miles of surface; and this, considering its extreme fertility, would be capable of supporting the whole of the human beings now resident on the face of the earth. The number of these is reckoned at about nine hundred millions; and this would be only three hundred to the square mile, which is considerably more than two acres for each individual; and we must not measure the fertility of tropical America by what we experience in this country, because a banana plantation bears fruit all the year round, and supplies more human food from a single acre than could be supplied by ten acres of the best corn land in England.

It is true, that this stupendous valley is not, in the mean time, so peopled and so cultivated; but assuredly there is no fault in nature, no reason, in the kindness of the Creator of the valley, why this should not be the case. On the other hand, it is really one of the chosen spots of nature, as the thickness and splendour of its forests, and the countless myriads of its flowers, its birds, and its mammalia, abundantly testify. The trade-wind of the Atlantic is always upon it, bringing the means of fertility. Its trees are festooned with climbing plants of the most exquisite colours; and whenever a little clear spot occurs amid the magnificent foliage, the breeze over it wafts a perfume of plants of the *amaryllideæ*, which no human pen can describe.

Nor is this extreme richness of the land all that this choice spot of the earth has to boast of. The river itself, while it unites the extreme boundaries, and might be rendered, in itself and its affluents, a perfect highway for a hundred nations, is rich in the means of life. The *manati* (the *pala vaca* of the Spaniards) inhabits the broad waters of the Amazon in countless thousands. It belongs to the *cetaceæ*, or whale tribe; but it is one of the fresh water ones, and its flesh and fat have none of the offensive qualities of those which inhabit the sea. It grazes the weeds on the banks, or those which are submerged by the water; and it is so plentiful that, in many parts of the country, its flesh is sold in the shops, and very much resembles veal.

Will the reader come with us again to the valley of the Amazon, for we cannot see it all at once?

MORE PROGNOSTICS FOR 1837.

Vox Stellarum.

February.—This month is remarkable for very numerous aspects, many of which are looking towards London, though Edinburgh will not escape *scot* free. Square, trinal, and other ugly opposition aspects casting towards Westminster. About the 14th, much trouble at the post-office. Domestic breezes; cool and frosty to the end of the month.

March.—Funds considerably affected in the Fleet; finances at fault in the King's-Bench. Barclay and trouble brewing; trouble brews most.

April.—Mars and Jupiter both retrograding in Leo, (the ruling sign of France,) portends troubles, changes among the deputies, &c., who succeed in enacting, to the delight of every loyalist, that Louis Philippe shall be shot at only once a month. About the 1st, numbers establish their right to take possession of the Scilly Islands.

May.—A visible eclipse of the sun every evening of this month; nor will the moon en-

tirely escape. Numerous plots cautiously hatched in the country; of which a great many are discovered by the rural police, and crushed in the egg; others not suspected till they are matured and take wing.

June.—Herschel seen at the Cape of Good Hope, with the naked eye.

August.—The sun in Aquarius, which means, the sun at a watering-place; and portends great inundations at Margate, Ramsgate, &c., of visitors.

September.—The dykes of Holland filled with water. Great scarcity in Ireland of tranquillity; the very bogs agitate.

November.—During this month many dark affairs will be discovered by candle-light.

December.—An alderman hung in chains. Turkey, the great subject of conversation at the Mansion-house. Reasons to complain of the state of Chili. Friesland obtains great accessions to its territory.

SUSSEX ROYAL INSTITUTION, AND MANTELLIAN MUSEUM, BRIGHTON.

THE want of a local Institution, devoted to Science and Literature, had long been felt and regretted at Brighton, a place which, with all its varied and powerful attractions, was deficient in any public establishment bearing an intellectual character, and calculated to interest and gratify the educated classes who form so large and influential a portion of its visitors. Several attempts have been made to supply a deficiency so generally felt and deplored; but all had failed of success, until at the commencement of the last year an endeavour was made, which we are happy to announce has been crowned with complete success. Two gentlemen, whose names are most honourably associated with literature and science, Mr. Horace Smith and Mr. Ricardo, in conjunction with other individuals, imbued with similar tastes, and actuated by kindred feelings, set on foot a society, which was based on the public exhibition of the celebrated collection of fossil organic remains, which had been collected by Dr. Mantell, at Lewes, and which a year or two previously had, at the instance of the Earl of Egremont, been removed to Brighton.

The plan of the Institution comprised the establishment of a library and reading room, the exhibition of Dr. Mantell's collection, the delivery of lectures, the holding conversazioni, &c., &c. The Earl of Egremont accepted the office of patron; and, with his accustomed munificence, bestowed the splendid donation of 1000*l.*; four noblemen, connected with the county, became the vice-patrons; Davies Gilbert, Esq., V.P.R.S., took on him the office of president; and the vice-presidents, subordinate of him and council, were selected from the rest of the intelligent members of the society; Mr. G. F. Richardson, known in the literary world by various publications, chiefly connected with German literature, was appointed curator and librarian; and various gentlemen of the town and county, contributed presents of books and specimens. A graduated scale of subscriptions was formed, which was rapidly filled. The museum was opened, and daily attended by numbers of fashionable visitors; lectures were delivered on geology and its auxiliary sciences; and the whole establishment has progressed in the most favourable manner, exhibiting every appearance of permanent and extended success; adding a new source of attraction to the place, and bestowing a higher and more intellectual character on its attractions and pursuits. In compliment to the venerated nobleman who had become their patron, the members of the society determined to hold their anniversary on the 19th of December, his lordship's birthday. Accordingly, on Monday last, the following arrangements were made for celebrating at once the *fête* of the Institution and of its patron.

At twelve o'clock, a meeting for the despatch of business was held at 20 Steine, when various honorary members were elected; at two, Dr. Mantell delivered a lecture at the Town Hall, to the members and their friends, at which 600 or 700 persons were present; and a dinner took place at the Old Ship, at six in the evening, at which about 120 guests sat down: Davies Gilbert, Esq., in the chair. Various addresses were made to the company; and though it might seem invidious to particularize, where all was replete with feeling and talent, yet we cannot but refer to the speeches of the Rev. J. S. M. Anderson, in proposing the health of the revered chairman, and of Dr. Mantell, in returning thanks for his own health, as admirable specimens of animated and impressive oratory. Horace Smith, Esq., recited the following lines, as introducing the health of the Earl of Egremont:—

SONG FOR THE ANNIVERSARY-DINNER OF THE SUSSEX ROYAL INSTITUTION.

19th Dec., 1836.

THOUGH Brighton, the pride of our island, was hail'd
As the gem of the ocean and queen of the land;
Though her rivals for favour and fashion had fail'd
Her progress to check, or her sway to withstand;
Though her palaces, halls, and saloons—the domain
Of the great and the gay—might profusely be shown,
One grace was deficient,—she wanted a fane
Which learning and science might hail as their own.

A fane from the strife of opinion apart,
Where the world-wearied man an asylum might find,
Might keep daily Sabbath, and hallow his heart
By the study of nature, the culture of mind;
Where the stranger and idler their hours might beguile,
While our townsmen, combin'd in the soothing pursuits
Of knowledge and lore, might forget for a while
All party dissensions, all local disputes.

This want to supply, we instinctively turn'd
To a patron, whose high philanthropic renown
And beneficent virtues already had earn'd
The gratitude, homage, and love of our town;
To one whose munificence fosters the arts,
While thousands his wide-spreading bounties proclaim;
To one whom I need not declare, for your hearts
Have responded beforehand to Egremont's name.

His princely donation a basis supplied
For our young institution, which, thriving apace,
Already may boast, with exorable pride,
That to Brighton it gives new attraction and grace.
For many have honour'd and aided our cause
Whose names are in letters and science renown'd,
While royalty's sanction, and public applause,
Have ennobled our title, our efforts have crown'd.

If the triumphs which thus from an Egremont flow,
Impress us at all times with gratitude deep,
How much must the sentiment quicken and glow
When, with glad celebration, his birthday we keep!
Still, still may he flourish, that oft we may meet,
To the noblest of nobles our tribute to give,
As with full hearts and glasses this toast we repeat,
"Our munificent patron, and long may he live!"

These were succeeded by the following poetical effusion, delivered by Mr. G. F. Richardson, after the health of Dr. Mantell:—

When wrapt in primal night Creation lay,
And nature languish'd for the birth of day,
Ere yet the world the bliss of light enjoy'd,
And earth and ocean lay a formless void.
Then God's own spirit moving o'er the deep
Awaken'd chaos from its lifeless sleep,
Chased from the dreary void the gloom of night;
And said, let light appear, and all was light!
Soon as the blissful boon to earth was given,
All nature hail'd this first, best gift of heaven,
Then loud hosannas through creation rang,
Then all the morning stars together sang,
Angelic natures shared the blest employ,
And all the sons of God were heard to shout with joy!

E'en thus in later times, to darkness hurl'd,
A kindred gloom o'erspread the moral world;
Primeval night usurp'd her early reign,
Earth's ancient darkness liv'd and rul'd again,
And mental gloom, and ignorance, and error,
Recall'd the chaos of the earliest time;
When, lo! the spirit of th' Eternal woke;
Again the dawn of light and knowledge broke;
Again the spirit of the immortal mind
Revealed the boon of science to mankind;
Gave to some favoured son, some child of earth,
A ray divine, a spark of heavenly birth,
Nor lent the blessing to his single breast,
But bade his spirit light and guide the rest!
Thus was a Newton taught to trace the skies,
And show how countless worlds o'er worlds arise.
Thus Milton soared in all the bliss of song,
Caught the best accents of th' ethereal throng,
Rose to the heights of heaven and linger'd there
"An earthly guest, and drew empyreal air."
And many a pilgrim in this "vale of tears"
Came but to point and lead to brighter spheres!

Yet while each realm of nature and of mind
Revealed the secrets in its depths confin'd,
One spot alone was left—this teeming earth
Lay all unknown—its wonders and their birth;
Until some master-spirit dared explore
Its hidden mysteries—myst'ries now so more.

Since Leibnitz, Werner, Cuvier brought to view
 Its varied states and changes ever new.
 And last a Mantell, on his native soil,
 With mind untired with self-requiting toil,
 Explored a mine with treasures all replete,
 And oped a scene of wonder at our feet.
 And as Columbus to the admiring world
 Another sphere of light and life unfurled;
 So to our awe-struck mind and wondering gaze
 Our Mantell wakes a world of other days,
 Annuls the former bounds of space and time,
 Recalls to life creations all sublime,
 Restores again the forms that breathed of yore,
 And bids earth's wildest wonders live once more!

And as a Newton bids us gaze on high,
 And trace our Maker mirror'd in the sky,
 As Milton taught the aspiring mind to soar
 To heights of heaven, and wonder, and adore,
 And share in joys to nobler natures given,
 And taste on this poor earth the joys of heaven:
 So, taught by Mantell's science, we may bring
 "Sermons from stones, and good from every thing,"
 Learn holiest lessons from each stone or clod,
 And "look through Nature up to Nature's God!"

The party separated about eleven, highly gratified with their mental feast.

Among those present were the Duke of St. Alban's, Sir Francis Burdett, Sir Edward Codrington, Sir Richard Hunter, Sir Ralph Rice, Sir James Fellowes, Mr. Murchison, the geologist, &c., &c.; the gallery was crowded with ladies, admitted after dinner, as spectators, who witnessed with evident delight the gratifying proceedings of the evening.

The enjoyment of the party was renewed at the *conversations* of the following evening; when Mr. Richardson read an "Essay on the Poetry of the Hebrews;" the Rev. Mr. Edwards, a paper on the "Equation of Time;" and Mr. Murchison described a series of interesting investigations respecting the "Geological Structure of the Cliffs of the west of England and of Wales."

We shall, from time to time, lay before our readers some account of the proceedings of this Society, which bids fair to assume an important rank among the institutions of the country; originating as it does under circumstances more than commonly favourable to its permanence and success; placed in a town the resort of the intellectual, and educated, and wealthy classes; honoured with the sanction of Royalty, for their Majesties have recently bestowed their sanction, and allowed it be entitled "The Sussex Royal Institution;" and, above all, directed and controlled by the energies and the genius of Dr. Mantell; who, in addition to his being one of the first geologists and palæontologists of the age, is also one of the most popular of teachers, and the most entertaining, as well as instructive of lecturers, the Society cannot fail to attain permanence and prosperity, and confer advantages not only on the town and county in which it is situated, but also to contribute, in an important degree, to the advancement of science, and the general diffusion of knowledge.

THE WESTERN EMIGRANT,

A PRIZE POEM,

BY MRS. SIGOURNEY, OF HARTFORD, AMERICA.

AMID those forest shades that proudly rear'd
 Their unshorn beauty toward the favouring skies,
 An axe rang sharply. There with vigorous arm
 Wrought a bold emigrant, while by his side
 His little son, with question and response,
 Beguiled the toil.

"Boy, thou hast never seen
 Such glorious trees; and when their giant trunks
 Fall, how the firm earth groans! Rememberest thou
 The mighty river on whose breast we sailed
 So many days on toward the setting sun?
 Compared to that, our own Connecticut
 Is but a creeping stream."

"Father, the brook
 That by our door went singing, when I launched
 My tiny boat, with all the sportive boys,
 When school was o'er, is dearer far to me
 Than all those deep broad waters. To my eye
 They are as strangers. And those little trees
 My mother planted in the garden-bound
 Of our first home, from whence the fragrant peach
 Fell in its ripening gold, was fairer, sure,
 Than this dark forest, shutting out the day."

"What, ho! my little girl,"—and with light step
 A fairy creature hasted toward her sire,
 And setting down the basket that contained
 The noon's repast, looked upward to his face
 With sweet, confiding smile.

"See, dearest, see
 Yon bright-wing'd parrot, and hear the song
 Of the gay red-bird echoing through the trees,
 Making rich music. Didst thou ever hear
 In far New-England such a mellow tone?"

"I had a robin that did take the crumbs
 Each night and morning, and his chirping voice
 Did make me joyful as I went to tend
 My snow-drops. I was always laughing there,
 In that first home. I should be happier now,

Methinks, if I could find among these dells
 The same fresh violets."

Slow Night drew on,
 And round the rude hut of the emigrant
 The wrathful spirit of the autumn storm
 Spake bitter things. His wearied children slept,
 And he, with head declin'd, sat listening long
 To the swollen waters of the Illinois,
 Dashing against their shores. Starting, he spake—

"Wife!—did I see thee brush away a tear?—
 Say, was it so? Thy heart was with the halls
 Of thy nativity. Their sparkling lights
 Carpets and sofas, and admiring guests,
 Befit thee better than these rugged walls
 Of shapeless logs, and this lone hermit-home."
 —"No—no!—All was so still around, methought
 Upon my ear that echoed hymn did steal
 Which 'mid the church where erst we paid our vows
 So tuneful pealed. But tenderly thy voice
 Dissolved the illusion."—And the gentle smile
 Lighting her brow,—the fond caress that sooth'd
 Her waking infant, reassur'd his soul
 That wheresoe'er the pure affections dwell,
 And strike a healthful root, is happiness.
 —Placid and grateful to his rest he sank,—
 But dreams, those wild magicians, which do play
 Such pranks when Reason slumbers, tireless wrought
 Their will with him. Up rose the busy mart
 Of his own native city,—roof and spire
 All glittering bright in Fancy's frost-work ray.
 Forth came remember'd forms—with curving neck
 The steed his boyhood nurtur'd, proudly neigh'd—
 The favoured dog, exulting round his feet
 Frisk'd with shrill, joyous bark—familiar doors
 Flew open—greeting hands with his were link'd
 In Friendship's grasp—he heard the keen debate
 From congregated haunts, where mind with mind
 Doth blend and brighten—and till morning rove'd
 'Mid the lov'd scenery of his father-land.

REVIEW.

Elements of Plane Geometry, Theoretical and Practical, including Plane Trigonometry, Mensuration of Plane Surfaces, and Geometrical Analysis. By THOMAS DUNCAN, A.M., Professor of Mathematics in the University of St. Andrews. MacLachlan and Stewart, Edinburgh. 1833.

THOUGH this work was published three years before we acquired the faculty of speech, or cut our teeth, (of which we purpose to make vigorous, but, we trust, not unseasonable, use,) yet it has come so recently under our notice, that we cannot help saying a few words respecting it. Those words cannot be many; and it may readily be supposed, that a systematic class-book upon the elements of plane geometry, drawn up expressly for the students of a university, cannot have the most powerful attractions for the readers of popular or miscellaneous writing. This book, however, is an exception: its subject is one of the most interesting to which the lovers of sound knowledge can pay attention, and one which has been literally tabooed to the great majority, not only of tolerably learned persons generally, but of those who actually have professional need of it, by the crabbedness of the elementary works. We say it with regret, but we say it from long personal experience, that there is a grievous lack of geometrical knowledge among the engineers, architects, surveyors, and other professional persons in this country, to whom geometry is more essential than any other science; and were we to enumerate all the bungleings and blunders in the execution of important works, which have resulted from this deficiency, we should require to bespeak more than six months of the "Miscellany" for this list alone.

Euclid's Elements, as restored by Simpson, and as rendered more elegant by Playfair, are delightful books to such as can read them with understanding; but they are sealed books to every one who has not a Columbus going before him to break the egg. In the very first book of Euclid there are many subjects mixed up not german to each other, and between the one and the other of which there is no passage for the young learner, however desirous he may be of learning. Even at the very fifth proposition,—the far-famed *pons asinorum*,—there is a mixture of shadowy matters, all true, no doubt, and beautifully true, but so dimly seen by the tyro, that for one student who passes this "bridge" triumphantly, ten, at least, stand still, and know no more of geometry.

Professor Duncan's elementary work unravels all these conclusions; and though it carries the student through the whole of plane geometry, including the mensuration of lines, angles, triangles, and surfaces, is yet so clear in its expression, and so gradual in its steps, that we could hardly imagine it possible for even a boy of eleven years of age to fail in understanding every word of it, without the assistance of a teacher. To borrow an expression, it is indeed "one perfect chrysolite," transparent, and without a single flaw; and earnestly do we wish that every school-boy

in the three kingdoms could be illuminated by its radiance.

We do not say this casually, as things are sometimes said by reviewers who neither understand their book, nor know its author. We love the mathematical sciences, for we know that in them is contained the mighty lever which has cast the idols of superstition down from their bases, and placed in their stead that illustrious personification of truth, by means of which human and divine knowledge have stricken hands, and glorious light and liberty have renovated the world. We also know Professor Duncan; that is, we once knew him, year after year, week after week, and day after day, for a longer period than the Grecian armies beleaguered the towers of Ilium; we know that he was then the foremost teacher of mathematics, in point of clearness and effect, that had ever come within the scope of our information,—and it was not very limited; and his book tells us that, far from falling off, he has gone on improving.

These are the grounds upon which we cordially recommend this volume, as the most simple, the most beautiful, and, notwithstanding its simplicity and beauty, the most profound that was ever written on the subject.

To give extracts of such a work, or even an analysis of it, would not suit our publication; but we may mention the general contents of the eleven books of which it consists. Book first is devoted to the comparison of straight lines and angles, the simplest of all geometrical subjects, and not confused by any reference to squares or other areas. Book second is devoted to the circle, and to lines in and about the circle, which is the next step in point of simplicity. Book third is devoted to the comparison of triangles and squares, which are the simplest of all geometrical figures. Book fourth is devoted to proportion; and the doctrine of equal ratios, which is so unwedgable in Euclid's Elements, is rendered exceedingly simple. The fifth book contains the application of the doctrine of proportion to the proper subjects of plane geometry,—lines, angles, and plane surfaces. The sixth book contains the elements of plane trigonometry. The seventh book contains their applications. The eighth book contains the mensuration of plane surfaces. The ninth book contains their application to the different kinds of surveying. The tenth book explains the geometry of the circle. The eleventh and last book exhibits a brief but very clear system of geometrical analysis; and to the whole there are appended very useful exercises on the different parts. Such are the contents of Duncan's "Elements of Plane Geometry."

His "Elements of Solid Geometry" are also before us; and we shall take an early opportunity of briefly adverting to them. We hope he will go on, and let us have other two volumes on general quantity; namely, the determinate, the indeterminate, and the differential analysis, in the same clear and masterly style as the present volumes.

GEMS.

CONVIVEMENT.—Is that beast better that hath two or three mountains to graze on, than a little bee that feeds on dew or manna, and lives upon what falls every morning from the storehouses of heaven, clouds, and Providence? Can a man quench his thirst better out of a river than a full urn, or drink better from the fountain which is finely paved with marble, than when it wells over the green turf?—*Jeremy Taylor.*

MISERY.—Were we called upon to name the object under the sun which excites the deepest commiseration in the heart of Christian sensibility, which includes in itself the most affecting incongruities, which contains the sum and substance of human misery, we would not hesitate to say, "an irreligious old age."—*Hannah More.*

EAR-RINGS.—The progress of civilization is slow,

but sure; ear-rings have at last followed nose-rings to the receptacle of things lost upon earth. Patches and "paint an inch thick" long since disappeared, and plucking the eye brows is now little practised among the ladies, except by those of the South Sea Islands. Little by little, and step by step, it is discovered that nature can make up a tolerably good-looking head and face, without having the aid of art to furnish up her handy work. This, however, has not been established completely as regards the body, but that the time will come, say in a century or two, when that problem will be solved in the affirmative, is not to be doubted, and curved spines and dyspepsia, liver complaints and consumptions, will be no longer incurred, in the attempt to teach dame nature the proper method of shaping the human frame. We are first in the race of human civilisation, though our education is not finished, as they say at boarding schools; and by looking at those behind us, we may see the gradations through which we have passed. The American Indians flatten the heads of their children to give them a genteel appearance. The people of Japan blacken their teeth; and ear-rings, and nose-rings, and toe-

rings, as well as armlets and anklets, are fashionable among those styled savages in all countries. Of these we are much in advance, as is proved by the gradual abandonment of ear-rings, which will be thorough, now that the fashionables of England have given them up. In a few years it will be thought as ungentle to be seen with such pendants, as it would for a lady to walk up Regent-street in the finery of an Esquimaux bride—dipped in train oil, and clothed in the entrails of a whale; such being the method adopted by the fair of that tribe to render themselves peculiarly attractive to their lovers.

HARMONY.—He who cultivates peace with others does them a kindness; but he does himself a greater, by the returns to his own breast. If you brighten a knife, it will smooth the stone on which you brighten it. This is the case with nations; they who promote it find happy returns. War is the reverse. The life of a man is a serious thing, it is his all, and ought not to be wantonly trifled away. War is one of the greatest plagues of man; and I am sorry it is a plague much courted. A bleeding man and bleeding nation take long to recover.—*W. Hutton.*

SAYINGS AND DOINGS.

DR. PRINGLE.—Solomon has said, "Answer a fool according to his folly, lest he be wise in his own conceit." Perhaps this has seldom been done in a more happy way than in the following occurrence:—Some years ago, as the late Rev. Dr. Pringle, of Perth, was taking a walk one summer afternoon upon the Inch, two young beaux took it into their heads to break a jest upon the old parson. Walking briskly up to him, they asked him if he could tell them what was the colour of the devil's wig? The worthy clergyman, surveying them attentively a few seconds, made the following reply:—"Truly here is a most surprising case,—two men have served a master all the days of their life, and can't tell the colour of his wig!"

GEORGE THE THIRD.—"The king and queen have suffered infinitely from the loss of the sweet little prince, who was the darling of their hearts (Prince Octavius). I was charmed with an expression of the king's: 'Many people,' said he, 'would regret they ever had so sweet a child, since they were forced to part with him. This is not my case; I am thankful to God for having graciously allowed me to enjoy such a creature for four years.' Yet his sorrow was very great."—*Hannah More.*

A SEA-BULL.—An Irishman who served on board a man-of-war in the capacity of a waister, was selected by one of the officers to haul in a tow-line of considerable length, which was towing over the taffrail. After drawing in forty or fifty fathoms, which had put his patience, as well as every muscle of his arms, severely to the proof, he muttered to himself, "Sure, it's as long as to-day and to-morrow; it's a good week's work for any five in the ship. Bad luck to the arm or leg it'll lave me at last. What! more of it yet! Och, murder! the sea's mighty deep, to be sure!" After continuing in a similar strain, and conceiving there was little probability of the completion of his labour, he suddenly stopped short, and addressing the officer of the watch, exclaimed, "Bad manners to me, sir, if I don't think somebody's cut off the other end of it."

FAMILY NAMES.—Henry Fielding being in company with the Earl of Denbigh, with whose family his own was closely connected, his lordship asked the reason why they spelt their names differently; the earl's family doing it with the *e* first (Feilding), and Mr. Henry with the *i* first (Fielding). "I cannot tell, my lord," answered the great novelist, "except it be

that my branch of the family were the first that knew how to spell."

MILLER AND HERSCHEL.—About the year 1760, as Dr. Miller, the organist, was dining at Pontefract, with the officers of the Durham militia, one of them, knowing his love of music, told him they had a young German in their band as a performer on the hautboy, who had only been a few months in England, and yet spoke English almost as well as a native, and who was also an excellent performer on the violin. The officer added, that if Miller would come into another room, this German should entertain him with a solo. The invitation was gladly accepted, and Miller heard a solo of Giardini's executed in a manner that surprised him. He afterwards took an opportunity of having some private conversation with the young musician, and asked him whether he had engaged himself for any long period to the Durham militia? The answer was, "Only from month to month." "Leave them, then," said the organist, "and come and live with me. I am a single man, and think we shall be happy together; and doubtless your merit will soon entitle you to a more eligible situation." The offer was accepted as frankly as it was made; and the reader may imagine with what satisfaction Dr. Miller must have remembered this act of generous feeling, when he hears that this young German was Herschel the astronomer.—*The Doctor.*

ANCIENT CUSTOM.—It is well known that the Bishops, when signing their names, use the old Latin appellations, or abbreviations of them, for their sees, instead of the English ones: thus, Ebor. stands for York, Cantuar. for Canterbury, Vigorn. for Worcester, and Exon. for Exeter. Some well-meaning people are occasionally much perplexed by these subtleties. When the princess Charlotte was labouring under an indisposition, the bishop of Salisbury sent frequent inquiries to her Scotch physician, signing himself "J. Sarum." The doctor, unversed in these niceties, observed to a friend, that he had been pestered with notes from "ane Jean Sarroom, that he ken'd nothing aboot. I tak' nae notice o' the fellow," said he.

A PRETTY BOOK.—"A lady," says Mrs. Piozzi, "once asked me, at Streatham Park, to lend her a book." "What sort of a book would you like?" said I. "An abridgment" was the unexpected reply; "the last pretty book I read was an abridgment."

PROVIDENCE.

A NUMEROUS class of ancient heathen entertained an opinion, that the invisible God abandoned the affairs of men entirely to themselves. They persuaded themselves that it must be inconsistent with his dignity to notice, and incompatible with his happiness to concern himself in, the transactions and objects of this lower world ; that his habitation was so immeasurably remote, and his felicity so essentially dependent on undisturbed repose, that the character and condition of men never shared for a moment his divine regards. They absurdly argued from their own limited capacity to his infinite perfection ; and because they found that the more independent they could render their contrivances of their subsequent care, the more they were at liberty for new contrivances and pursuits, they transferred the same ideas to the infinite God ; forgetting that the perfection of an uncircumscribed essence consists partly in pervading and superintending all things, and yet being absolutely independent and happy.

This was approaching the consummation of their misery and guilt. For, by this virtual annihilation of the Divine Being, they destroyed every adequate restraint on vice, every encouragement to virtue, and every ground of substantial consolation to distress. The vicious might sin on without dreading his frown ; the virtuous might practise self-denial, and aim at improvement, without hoping to obtain his smile ; and had all the sufferers which the world contained sent up one united groan, one imploring supplication for relief, they would only have been giving their breath to the winds. They voluntarily reduced themselves to the blank and cheerless estate of being "without hope," because "without God, in the world."

How different the view of his character and conduct is that which divine revelation supplies ! It draws aside the veil which concealed his glory from our eyes, and shows him in his high and holy place, not in a state of silence and solitude, but surrounded by ten thousand times ten thousand and thousands of thousands, each of them waiting to do his bidding ; not in a state of moral inactivity, but in active communication with every part of his vast dominions, through a thousand different channels ; not in a state of apathy, regardless of earth and all its multifarious concerns, but as actually bending towards it, listening to every sound it utters, observing the conduct of every being it contains, and approving or condemning every action which it exhibits ; it even shows him to us in the astonishing act of raising up the fallen and prostrate children of earth, and putting them in the way of reaching his own abode.

Deferring, for the present, a detailed consideration of the evidence on which the doctrine of a universal providence rests, I will merely re-

[No. 4. JAN. 23, 1837.—2d.] VOL. I.

mind the reader that nature, with all its countless tribes and successive generations, can only be regarded as a part of the family of Providence ; that prophecy is only a leaf from the book ; a section of the great plan ; that remorse is only a recognition of the doctrine of Providence ; that the dread inspired by conscious guilt is only a repetition of Belshazzar's doom—a sight of the hand of Providence guiding the lightning before the sinner's eye ; that prayer is an appeal to Providence ; the final Judgment the winding up of Providence ; and the eternal happiness of the saved, its ample and sublime results.

I will now only invite attention to the consolatory nature of the doctrine. It includes a species of consolation, indeed, even for the irreligious. Solemn thought ! It assures them that if they will perish, their doom shall not commence a moment before it is righteously due, nor in the least degree exceed the severity which their guilt has deserved. Justice shall be done them. But to the Christian the doctrine is an unmixed consolation. He believes that the same providing mind which bestowed "the unspeakable gift," is engaged to supply his daily bread ; that the same kind and careful hand which led him away from the verge of the bottomless gulf, is employed in conducting him to heaven. And can he believe this ? can he realize to himself the cheering truth that he is living in the hand of God, and not be solaced by it ? If this truth had been revealed, and brought to you to-day, reader, for the first time—if your affairs had hitherto engaged no attention but your own, and it had to-day been revealed to you that from this moment God would watch over them, that he intended to treat them as a part of his own affairs, that he had actually taken the management of them into his own hands, would not the report bring you relief, and fill you with delight ?

Go to a person who is in the last extremity of want and wretchedness ; tell him that his situation has excited the sympathy of those who will befriend him ; inform him that they are persons high in rank, and great in resources ; and that they have never been known to abandon a benevolent object when once they have adopted it ; tell him this—and, if he can bring himself to believe tidings so joyful, will he not feel that his wants are at an end, and be ready to give a loose to exclamations of delight ? But though such a case were to occur ; nay, more, though the individuals who befriended him were the most distinguished on the face of the earth, philanthropists, philosophers, and kings ; and though they were daily to meet in solemn deliberation on nothing but his affairs ; and were to place the whole of their resources for his use, what would it all be, great as it seems, compared with the fact, that the great God himself takes

E

the charge of our affairs? How insignificant to have a few fellow-creatures assume the management of our concerns, liable as they are to err, weak in their utmost strength, and unable to aid us when most we need assistance—compared with the superintending providence of the all-wise, almighty, all-sufficient God, infinite, immutable, and eternal! Yet this is the privilege of the Christian. With the psalmist, he can say, "My times are in thy hands;" in higher than human, higher than angelic hands; they are in *thy* hands, who art the Lord both of angels and men. They are not conducted at a distance, not indirectly managed, or indistinctly known, they are "in the Lord's hands." Had he powers of vision to pierce to the throne of God, and could he look on all that passes there, he would see that his affairs are represented there as distinctly and as fully as are those of the loftiest archangel that stands in the presence of God. He would behold there the "book of remembrance;" and had he power to inspect its sacred pages, he would find a page devoted to his special interest—a page in which his name is written, his character delineated, his history recorded, and the very hairs of his head numbered. "We know

that all things work together for good to them that love God, to them that are the called according to his purpose."

And as if this doctrine did not afford consolation enough, the Saviour of the world draws near, and says to all who have believed, "ask what ye will, let not the fact of a Providence keep you from the throne of benevolence; for while its plans secure to you whatever is necessary to your safety, they secure to you all that is essential to your enjoyment also, provided you desire it: "ask what ye will, and it shall be done." He is aware that he can safely leave them to the free expression of their desires, and the choice of their blessings; that he may safely intrust them with the keys of his vast resources, and give them access to all his treasures. They are so sensible of their own ignorance of what is best for them, that, like Solomon, when allowed to ask what he chose, they would first ask for wisdom to make the choice. They are so satisfied with his wise and beneficent Providence, that they would refer the choice of their blessings back again to himself; saying with the Psalmist, "Thou shalt choose our inheritance for us."

STANDING AT EASE.

THOUGH we are not sure that those who are commanded to "stand at ease" are always at ease "when they stand," yet, for a reason which will presently appear, we have alluded to this subject, at the same time cordially wishing that, by the total abolition of armies and work for them, all mankind may be allowed to "stand at ease;" or, otherwise, to "rest at ease," as may be most agreeable to their own personal feelings.

The reason to which we have alluded will be found in a passage which we shall quote from a Treatise on "Animal Mechanics," published under the superintendence of the Society for the "Diffusion of Useful Knowledge," as it expresses itself, and published anonymously, or rather under the sanction of about eighty names of some weight and authority, as committeemen, central or local. This parade of names was, we believe, put forth for the express purpose of extinguishing all independent literary and scientific men, in order that their places might be supplied by needy members or dependents of the community. It is needless to add, that the society has failed in this: it was a little behind the age at the beginning; and its apparent steps have been what is, in the terse language of the army, called "marking time;" that is, first throwing out one leg and then another, but drawing them back again, and never budging an inch.

This, however, does not remove from the Society the blame of any thing erroneous, either in fact or in velocity, which may have been, or

which may be published, under the *weight* of their authority.

As we do not observe the name of a single military man in the list of the committee, as existing at the time when this treatise on "Animal Mechanics," or, to speak more correctly, this "Animal Treatise on Mechanics," was published, we suppose the committee had in view that consummation which we ourselves so earnestly desire, namely, the total abolition of war; and that they saw meet to undermine the soldier while "standing at ease," by bringing the blunderbuss of false philosophy to bear upon his footing.

The passage to which we allude is in the following words:—"The posture of a soldier under arms, when his heels are close together, and his knees straight, is a condition of painful restraint. Observe, then, the change in the body and limbs when he is ordered to stand at ease; the fire-lock falls against his relaxed arms, the right knee is thrown out, and the tension of the ankle joint of the same leg is relieved, whilst he loses an inch and a half of his height, and sinks down upon his left hip. This command to "stand at ease," has a higher authority than the general orders. It is a natural relaxation of all the muscles, which are, consequently, relieved from a painful state of exertion, and the weight of the body bears so upon the lower extremity, as to support the joints independently of muscular effort."—*Animal Mechanics*, p. 19.

It would be extremely difficult to find, in any

other book whatever, so many blunders in so short a passage as this ; and the committee of the Society for the " Diffusion of Useful Knowledge " are highly reprehensible for having suffered it to get into circulation. In the first place, when a soldier stands at " attention," that is, bearing equally upon both his legs, with the heels together, and the axes of the feet forming an angle of sixty degrees, this is not " a condition of painful restraint," but one in which the human body can remain longer than in any other, though a little training is required in order to this. In the second place, when a soldier stands at ease, he never draws back his *left* foot for the purpose of relaxing the " tension of the right ankle." He does the very reverse : he draws back the *right* foot, until the bend of it is against the left heel, throws the weight of his body upon the right leg, and thus relieves the left side. In the third place, " standing at ease " is not a mere relief from " standing at attention," except to raw recruits and members of the awkward squad, beyond which it does not appear that the military experience of the author of this treatise could possibly have extended.

The authors of the system of military training may possibly not have been philosophers capable of writing a treatise on animal mechanics, or a Bridgewater treatise on the Hand, but assuredly it is not on this account the more probable that they were fools. They knew the means of economizing the muscular power of the soldier ; and they have applied those means in a way from which Sir Charles Bell himself, notwithstanding the mighty volume of his animal science might take a lesson.

The right side of the soldier is, to use a homely expression, the professional side of the soldier, and the left is the pioneering side. The right hand primes, loads, and fires ; the right shoulder is the rest or great point of support in firing, and in order to give it effect, the right foot is drawn backward and turned out ; and in like

manner the right haunch is the point of rest in charging with the bayonet ; both in firing and in the charge, the left hand acts the part only of a stay to steady the musket against its rest. The left side, again, always carries the musket except upon very particular occasions, and those of skirmishing parties, when they have to run in advance or retreat. When the soldier is long under arms, and carrying his musket with the butt in the left hand, the strain upon the left side is considerable. The elbow joint and the hand are relieved by supporting the musket, by bringing the left hand across the breast, with the projecting parts of the lock above the arm. This, however, does not relieve the left side ; and therefore, like the former position, it cannot be very long continued without injuring the efficiency of the man. In so far as the musket is concerned, the left side is relieved by ordering arms, that is bringing it down to the ground with the butt parallel to the right foot. Even then, however, the left leg remains under considerable disadvantage, as the right side does not partake in the previous fatigue of the shouldered musket ; and therefore, in order to give the left side all the relief which is consistent with a soldier standing in a line, the right foot is drawn back, and the weight of the body thrown chiefly upon it, while the left side is in a relaxed and easy position. This is the real mode of standing at ease, and the reason why it is done ; and we have alluded to it from no desire to praise or encourage drilling or soldiering in any way whatever ; but because the account of it which we have quoted is totally incorrect, and shows that the author has quite misunderstood the subject, and should correct it in some future edition, lest some ungentle critic should say he is

" Old dog at physiology :

But as a dog that turns a spit,
Bestirs himself, and plies his feet,
To mount the wheel, but all in vain—
His own weight brings him down again."

THE MUFFLED KNOCKER.

GRIEF ! grief ! 'tis thy symbol, so mute and clear,
Yet it hath a tale to the listening ear,
Of the nurse's care, and the curtain'd bed,
And the baffled healer's cautious tread,
And the midnight lamp, with its fitful light
Half screen'd from the restless sufferer's sight ;
Yes, many a sable scene of woe
Does that muffled knocker's tablet show.

Pain ! pain ! art thou wrestling here with man
For the broken goal of his wasted span ?
Art thou straining the rack on his starting nerve,
Till his firmest hopes from their anchor swerve ;
Till burning tears from his eye-balls flow,
And his manhood yields in a shriek of woe ?
Methinks thy scorpion sting I trace
Through the mist of that sullen knocker's face ?

Death ! death ! do I see thee with weapon dread ?
Art thou laying thy hand on yon cradle bed ?
The mother is there, with her sleepless eye,
She disputeth each step of thy victory ;
She doth fold the child in her soul's embrace,
Her prayer is, to be in her idol's place ;
She hath bared her breast to thine arrow's sway,
But thou wilt not be bribed from that babe away.

Earth ! earth ! thou dost stamp on that scroll of bliss
The faithless seal of a traitor's kiss,
Where the bridal lamp shone clear and bright,
And the feet through the maze of her dance was light.
Thou biddest the black-robed weeper kneel,
And the heavy hearse roll its lumbering wheel :
And still to the heart that will heed its lore,
True wisdom doth speak from the muffled door.

L. H. S.

LADY HESTER STANHOPE.

CHAPTER I.

LADY HESTER STANHOPE, niece of Mr. Pitt, left England upon the death of her uncle, and travelled over Europe. Young, rich, and beautiful, she was received every where with that eagerness and warmth of interest which her nobility of rank, her fortune, her mind, and her beauty would attract towards her. She constantly refused, however, to unite her fate to any of her noble admirers; and after passing several years in the principal capitals of Europe, she embarked with a numerous suite for Constantinople. The motives which induced her thus to expatriate herself have never been known. Some have attributed them to the death of a young English general, who was killed about that period in Spain, and whose image was ever presented with deep regret to the thoughts and affections of Lady Hester. Others have ascribed it to a fondness for adventure, which might be supposed naturally to exist in a person of so courageous and enterprising a character. She spent several years at Constantinople, and finally embarked for Syria, on board an English vessel, which was freighted with a great part of her treasures and jewellery, and presents of an enormous value.

A tempest overtook them on the coast of Caramania, opposite the island of Rhodes, and the vessel struck on a sunken rock, some miles from the coast. She was in a few minutes beaten to pieces, and her valuable treasures sunk in the waters. Lady Stanhope was saved with difficulty, and was floated on some planks of the wreck to a small uninhabited island, where she remained four and twenty hours without food or succour, till some fishermen of Marmoriza, who were searching the wreck, discovered her, and conducted her to Rhodes, where she introduced herself to the English consul. This sad disaster did not alter her resolution. She passed on to Malta, and from thence to England. She collected the wrecks of her fortune, and sold part of her domains, and having freighted a second vessel with treasures and jewelled presents, again set sail. This voyage was successful, and she disembarked at Latakia, the ancient Laodicea, on the coast of Syria, between Tripoli and Alexandretta. She established herself in the immediate vicinity, made herself perfect in the Arabic language, and gathered around her all those persons who could give her information of the different Arab populations, the Duezes and the Maronites of the country; and prepared herself for journeying into those least accessible parts of Arabia, Mesopotamia, and the deserts around it.

When she had thus familiarized herself with the language, customs, morals, and manners of the country, she formed a numerous caravan, loaded camels with rich presents for the Arab tribes, and traversed the whole of Syria. She

stopped at Jerusalem, Damascus, Aleppo, Kornos, Balbec, and Palmyra; and it was at this latter station that the wandering Arabs, who had facilitated her approach to, and progress through, the ruins, assembled around her tent, to the number of four or five thousand, and, won by her grace, beauty, and munificence, proclaimed her queen of Palmyra, and delivered firmans to her, by which it was stipulated that every European under her protection might freely visit the ruins of Balbec and Palmyra, on engaging to pay down one thousand piastres as tribute money. This treaty still exists, and would be faithfully fulfilled on the part of the Arabs, on positive proof being given them of the traveller being under the protection of Lady Stanhope.

On returning from Palmyra, she was nearly carried off by a numerous tribe of Arabs, enemies of those who had proclaimed her at Palmyra. She was early apprized of the danger by one of her own Arabian troop, and owed her safety, and that of her caravan, to a forced midnight march, and to the swiftness of her steeds, who rapidly crossed an incredible space of the Desert in twenty-four hours. She returned to Damascus, where she resided for some months under the protection of the pasha, to whose care she had been strongly recommended by the Porte.

After a wandering life, spent in all the countries of the east, Lady Hester Stanhope finally settled herself in an almost inaccessible solitude, on one of the mountains of Libanus, near the ancient Sidon. The pasha of St. Jean d'Acre, Abdalla Pasha, who had a high respect and devotion for her, gave up to her the ruins of a convent and the village of Dyioun, inhabited by the Duezes. There she built several houses, surrounding them by a wall of circumvallation, similar to the fortifications of the middle ages; she there formed, artificially, a delightful garden, in the Turkish style, with flowers and fruits, arbours of vines, kiosks enriched with sculpture and arabesque paintings, running waters in marble trenches, and fountains flowing under the shade of orange, fig, and lemon trees. There Lady Stanhope lived several years, in complete oriental luxury, surrounded by a large number of European and Arab dragomans, a numerous suite of women and black slaves, and in the midst of friendly and political feelings with the Porte, with Abdalla Pacha, with the Emir Beschir, the particular sovereign of the country, and especially with the Arab sheiks of the deserts of Syria and Bagdad.

Her fortune, however, which was still considerable, soon became diminished, and her affairs at home deranged in consequence of her absence; and she found herself reduced to an income of

from thirty to forty thousand francs, which was still sufficient for the support of that rank which she maintained. Those persons, however, who had accompanied her from Europe either died or left her; the friendship of the Arabs, which requires to be constantly kept up, either by presents or by dissimulation, began to abate; the reports she received from them were less frequent, and Lady Hester soon became the isolated being that I found her; and it was under these circumstances that the heroic temper of her disposition showed itself, and proved all the constancy and resoluteness of her spirit. She never thought of retracing her steps; she did not give one regret to the world or to the past; she did not sink under abandonment or misfortune, the perspective of old age, or the forgetfulness of the living; she dwelt alone, where she now still remains, without books or journals, without letters from Europe, without friends, or even slaves, who were attached to her person; surrounded merely by some negroes, some black slave children, and a certain number of Arab peasants to take charge of her garden and horses, and to watch over her personal safety. It is generally supposed, and the reports which I have heard induce me to believe, that her supernatural strength of spirit and resolution is shown not only in her general character, but in her belief in certain exalted religious ideas, wherein the *illumination* of Europe is mingled with oriental fancies, and more particularly with the mystic wonders of astrology. However this may be, Lady Stanhope bears a great name in the east, and is a great wonder in Europe. Finding myself so near to her, I was anxious to see her: her dream of solitude and meditation had so much apparent sympathy with my own thoughts, that I was glad of an opportunity of verifying in what our ideas approached to each other. But nothing is more difficult than for an European to be admitted to her: she refuses all communication with English travellers, with women, and even with the members of her own family. I therefore had but little hope of being presented to her, and I possessed no letter of introduction. Knowing, however, that she still kept up some distant communications with the Arabs of Palestine and Mesopotamia, and that a recommendation from her hand might prove of great use to me among these tribes, in my future pilgrimages, I determined on sending the following letter to her by an Arab:—

"MY LADY,

"LIKE you, a traveller and a stranger in the east, coming but to view the spectacle of nature, her ruins, and the works of the Almighty, I have just arrived in Syria with my family; and I shall count as among the most interesting days of my journey, the one in which I shall have known that woman who is the wonder of that eastern land which I am visiting.

"If you will receive me, acquaint me with the day most convenient to you, and let me know if I am to come alone, or if I may bring with me some of the friends who are accompanying me, and who will not attach a less price than myself to the honour of being presented to you.

"In asking this favour, my lady, do not allow your politeness to be constrained in granting to me that which is repugnant to your habitudes of absolute seclusion. I estimate too much myself the price of liberty and the charm of solitude, not to understand and respect your refusal.

"Accept," &c.

I did not wait long for an answer: on the following day, at three o'clock in the afternoon, the equerry of Lady Stanhope, who was also her physician, arrived with an order to accompany me to Dyoun, the residence of this extraordinary woman.

We left at four o'clock. I was accompanied by my friends, a guide, and a servant; we were all mounted on horseback. We soon passed through a wood of magnificent firs, originally planted by the Emir Fakardia, on a lofty promontory, from which the view extended on the right over the stormy sea of Syria, and on the left over the magnificent valley of Leban,—an admirable point of view, wherein the beauties of western nature, the vine, the fig-tree, the mulberry-tree, and the pyramidal poplar, were united with the slender lofty columns of the eastern palm-tree, the leaves of which were thrown by the wind like large plumes upon the deep blue of the firmament. Some distance on we entered into a desert space of red sand, that had accumulated in large and moving waves, like those of the sea. There was a strong breeze, and the wind furrowed, ruffled, and fluted the waves of sand as it would have furrowed the waves of the sea. The sight was a new and a sad one: it was like an apparition of the vast and real desert that I was so soon to traverse. No trace of men or animals subsisted on this undulating arena; we were guided only by the moanings of the sea on the one side, and by the shining summits of the mountains on the other. We soon came upon a road, or causeway, strewn with enormous blocks of angular-shaped stones. This road, which follows along the course of the sea even to Egypt, conducted us to a ruined house, the remains of an old fortified tower, wherein we passed the sombre hours of night, sleeping upon a rush mat, and wrapped up in our mantles. When the moon arose we remounted our horses. It was one of those nights when the heavens are glittering with stars, when the most perfect and profound serenity appears to rest in the ethereal depths which we contemplate from here below, but when nature around us seems to moan and tremble in fearful convulsions. The desolate aspect of the shore for the space of some leagues added to this pain-

ful impression. We had left behind us, with the twilight, the beautiful shadowy declivities, and the rich verdant valleys amid the mountains. We afterwards came to a region of hills, covered from their base to the summit with black, white, and grey stones, the remnants of former earthquakes; whilst on our right and left the sea, which since the morning's dawn had been lifted by a rough tempest, rolled in loud and menacing waves, that we saw surging from afar, by the shadow which they cast before them, and, striking on the shore with a loud thunder-shock, threw in white masses the boiling spray on to the ridge of wet sands along which we were journeying, covering our horses' hoofs, and threatening to entrain us back with them. A moon, as brilliant as a winter's sun, threw sufficient light upon the sea to show to us its fury, yet with scarcely sufficient ray upon our road to assure us of the dangers of our journey. We soon afterwards saw the blaze of a fire spring up from the summit of the mountains, mingling with the white and sombre mists of morning, and throwing over the wide landscape that wan and faded light which is neither night nor day, which has not the lightness of the one or the serenity of the other,—an hour painful alike to the eye and to the thoughts, a struggle between two contrary and opposing principles, of which nature often shows the afflicting image, and which oftener still we find within the depths of our own hearts. At seven in the morning, beneath a burning sun, we left Salde, the ancient Sidon, which stretches out upon the waters like the glorious remembrance

of a past dominion; we now descended rough, torn, and naked declivities, which, after a while, rising from height to height, led us to that solitude for which with our eyes we searched in vain. As we advanced and rose over each elevation, we discovered a still loftier one before us: mountains were chained to mountains, leaving between each link dry and deep ravines, covered with large masses of grey and white rock-stones. These mountains were completely devoid of earth or vegetation; they were but skeleton hills, which the winds and the waters have beaten upon for ages past. It was not there that I expected to find the dwelling-place of a woman who had visited the world, and had the whole universe before her whereon to choose her home. From the summit of one of these rocks I saw a deeper and broader valley, surrounded on all sides by mountains of a more majestic, but less sterile character. From the middle of this valley the mountain of Dyion arose, like the base of a large tower, surrounded by circular rocky edges, which, lessening as they arose, terminated in an esplanade of some hundred feet in extent, covered with a rich and verdant vegetation. A white wall, flanked by a kiosk at one of its angles, enclosed this verdant spot. This was the dwelling of Lady Hester. We reached it at noon. It had neither the aspect of an European or oriental residence, but resembled in its appearance those poorer convents of Italy and Spain situated upon the summits of the mountains, and belonging to the mendicant orders of monks. EPHON.

TEMPERANCE VERSUS INTEMPERANCE.

ARTICLE THE SECOND.

BUT the stock of wonders was not yet exhausted. Returning to the various objects which were still awaiting examination on the table, the company appeared to be particularly struck with the following. The pale, hard, shrunken liver of a drunkard; Hogarth's "Gin Alley;" "An Infalible Receipt," &c. To make a man divulge the secrets of his friend, let him take one glass more than his wont; to illustrate the doctrine of transmigration, let him repeat the dose, and his soul will pass into the body of some strange beast; to prove the existence of demons, let him repeat the dose again, and he will strikingly resemble the *possessed* swine, spoken of in Scripture, and well-nigh deserve, if not actually incur, the same fate: a humiliating spectacle; or, Socrates* and Cato† drunk: a picture of the first drunkard;

* *Hos quoque virtutum quondam certamine magnum Socratem, &c.*

They say, in this too, Socrates the wise,
So great in virtue's combats, bare the prize.

Cor. Gal. cl. I.

† *Narratur et prius Catonis, &c.*

'Tis said, by use of wine repeated
Old Cato's virtues oft were heated.

with the quaint but striking motto, "Satan's Triumph; or, the Second Fall of Man;" and a representation of the contents of the drunkard's glass, as magnified by a moral microscope in the solar light of eternity, exhibiting nothing but a glass full of lucid flame, alive with knotted and writhing worms, more hateful than the imagination had ever conceived.

Two books remained to be noticed. The first proved to be a volume of the "Temperance Penny Magazine;" every page of which teemed with warnings against intemperance, and with encouragements to the opposite virtue. The other, to my great surprise, was an old book which I had just been reading,‡ and in the margin of which I had marked many interesting paragraphs: two or three, with the permission of the company, I proceeded to read:—

"I can no better compare these cups, than to watering-pots, that water the garden of vices, which come up so thick and fast. * * *

‡ The great Evil of Health Drinking; or, a Discourse, &c. London: Printed for Jonathan Robinson, at the Golden Cross, in St. Paul's Churchyard. 1684"

The drunkard, devil-like, is a sinner, who cannot be content to be wicked alone, but he must needs tempt others to the same wickedness also.

"Drunkenness is the greatest disgrace a man can put upon himself or others. Why shall it not be reputed to be as great a dishonour to be laid by the heels by this sin, as to be put in the stocks or a prison? Suppose a company of rude and impudent servants should combine to abuse their master, a person of noble birth, and great honour; to that end they should wheedle and gull him into a pleasant humour, make him very merry, and, when they have levelled him down to a familiarity, they take his place, and play the master; they then put out one candle, and anon another, and then come the grooms and footmen, and paw upon him, and at last lay him under the table, or in a meaner place. Thus the divine reason is abused by the senses, and the inferiors being little better, or rather, in that, worse than brutes, make sport with their master.

"Again, imagine a noble person to have many graceful and useful servants under him, and if they be not true and officious to him, it is his fault, and not theirs; and this noble person being out of humour, he turns one out of his place, and then another, until he have left him none to help him: would it not be a very ignoble action? Would he not, when come to himself, repent, and do so no more? Is it not like this, when the noble reason and affections are depraved by lust, do serve his senses, and the members of his body, even those that were born with him, bred with him from the very cradle, went to school with him, lay in the same bed with him, and are as dear to him, when he is himself, as his very eye, hands, and feet; but he doth cast them off by the insinuation of wine; the eyes fail, the hands shake, the legs wave like reeds: *neque pes, neque mens satis officium faciunt*. And though they are next day taken home again, yet, for aught he knew, they were quite gone, never to be seen till the resurrection. It is a high offence to our glorious Creator; it perverts the end of our redemption; it unmans the man; and is a contempt of death, the grave, and hell itself. If men had any reverence for their God, Creator, Saviour, Sanctifier; if any honour for their own nature; if any sense of mortality, and of the reference this mortal life hath to eternal life, they would never leave it thus, throw away their time thus. How curious are men of their own pictures, of their children's faces and shapes, of the monuments of their ancestors! how enraged at the violation of their daughters! And will you, with your own hands, by the ungrateful abuse of plenty, deprive, defile, swill, and prostitute yourselves? What, if you were stripped, by your own servants, of your own clothes, and they should put on you their liveries or frocks, would you brook it? Yet a gentleman is a gentleman in the meanest garb;

but you are not men when you undress or put off sobriety: In a word, it is a great sin; and what if the Lord call you away while committing it?"

Under the combined influence of this pointed appeal, and of the impressive circumstances which had preceded it, a series of resolutions, which the members had prepared for the occasion, were unanimously adopted, binding them forthwith to the conscientious observance of the strictest temperance, and to a strenuous endeavour to promote it in others. And as if to confirm them in these noble intentions, letters were read, either from those, or concerning those, who, having formerly numbered among their compotators, had been invited to join them in their present reformation. One of these letters was dated from a gaol; a second from a poor-house, imploring a trifle to enable the wretched writer to gratify his thirst for the poison which had already dragged its victim to the edge of the grave; a third imported that the person expected to write was at present an inmate of a lunatic asylum; and a fourth, dated from the bed of death, and signed with the palsied hand of death, contained this sentence: "A victim of intemperance, and one of your former companions, warns you—flee, flee from the fatal cup; at the last it biteth like a serpent, and stingeth like an adder. My breast, at this moment, is filled with these coiled and gnawing reptiles; my heart is compressed in their writhing folds; they have bred within me the worm that dieth not. Flee, flee from the fatal cup."

When the meeting was about to break up, I took the liberty of making the following remarks: "Gentlemen, were an account of the preternatural scenes which this room has witnessed tonight to be reported, the relation would be considered an idle tale. But wonderful as are the sights which your eyes have seen, and the sounds which your ears have heard, could your senses have been adequately opened, you would have perceived greater things than these. The whole intelligent universe is interested in the proceedings of this evening. Angels have bent over you, a great cloud of invisible witnesses have encompassed you, God himself has approved and has recorded your vow in the book of his remembrance. But though heaven approves, expect not to escape the ridicule of earth. On this subject allow me to quote a sentence or two from the author with whom I have already made you acquainted. Drinking of healths he speaks of as a prologue invented by the great enemy to introduce the tragic scenes of intemperance which so frequently follow. 'And it is most likely to deceive and take, because it hath the face of friendship, and the good looks of love and kindness. And he that dissents from it looks like some odd peevish humourist, an unbewn piece of moroseness, that will not fall in and close in the

square of society, and, therefore, is fitter to live by himself, and to keep home, than to come abroad. And if the dissent breed an argument, the consenters clearly carry it by the poll; and they that oppose it are judged to wrangle against points of honour, civility, breeding, good manners, good nature, yea, innocency, and the received custom of all sorts and qualities of well-tempered men, men of great virtue and accomplishments. How ridiculous doth that odd man look that makes not one among them! as ridiculous as if he wore a high-crowned hat lined and faced with scruples, a deep ruff, and a fur gown; as if he were made up of scruples, formality, and seriousness.' This witness is true; and you must expect to prove it. So little progress have societies like yours made in England, and so little has the subject engaged the consideration even of what is called the religious world, that you will seldom be able to avow your principles with-

out falling under the suspicions of the company. Looks of wonder will be exchanged, difficulties started, cases supposed. One will deem you an enthusiast with an hobby; another will fear that you have a crotchet in your head; and another accuse you of warring against social enjoyment. But persevere; you have a testimony within, and a record on high. Look upon yourselves as divinely appointed to the task. You are moral heroes, who deserve, and will ultimately receive, the thanks of the community. The time will come when, awaking as from a long and drunken dream, the entire people will form a grand, national Temperance Society. It will be your honour to be numbered among its founders."

The assembly broke up; and the members, who had never before met without leaving their humanity behind them, now departed with that humanity invested with a kind of divinity.

THE POWER OF RELIGION IN DEATH!

"We have heard a great deal of those brilliant scintillations of intellect that sometimes cast a dazzling lustre round the dying couch. Eloquent orations on this topic have been addressed to audiences more disposed to swallow the marvellous than investigate the probable! The whole is, in my opinion, an innocent Romance, calculated to gratify the feelings—perhaps flatter the pride—of the living, by throwing a halo round the couch of the dead.

"Every one knows how prone are the friends and spectators of the dying man, to mark each expression—treasure it up in the mind—and embellish it in the rehearsal. But the experienced physician, and the calm philosophic observer, reduce these exaggerations within the narrow and sober boundary of truth. Few have had the melancholy task of witnessing more death-bed scenes than myself, whether amid the storms and havoc of war, or in the quiet walks of peace. But no such coruscations of the mind have I ever beheld when the immortal spark was deserting its uninhabitable tenement. The phenomenon is contrary to nature and experience, and miracles I leave to those who prefer them to experimental truths.

"The alleged fact, though grossly exaggerated, has some foundation. In a very considerable number of instances, the dying man and woman retain possession of their mental faculties till within a very short period of their dissolution; and this depends on the nature and seat of the disease. Many maladies destroy life without materially disturbing the organ of the mind—the brain—till the last hour of existence. Pulmonary consumption is one of these, and the list is rather extensive. In such cases, we frequently observe a serenity of mind; a tranquillity; a placid re-

signation to the will of the Almighty; and even a cheerfulness in contemplating the approaching change. But as to any preternatural blazing-up of the expiring taper, at such moments, it is either sheer imagination in the by-standers, or a poetical creation of after-thought. No rational or physiological explanation of the phenomenon has been attempted by the historians of these death-bed illuminations! No, they have left them to the easy and convenient solution of *supernatural* agency. The explanation which I have given is founded on physical facts, and with the miraculous I have no concern."

The above is an extract from Dr. James Johnson's recent work, "The Economy of Health," and we place it at the head of this article, because if he means by "the brilliant scintillations of intellect," the animated expression of hope and joy, uttered by many a Christian in the hour of death, we totally deny the assertion, that "such phenomena are contrary to nature and experience;" and because we think such a statement, however true it may be in all the instances which have passed under Dr. Johnson's personal observation, it ought not to go forth to the world that the influence of the Gospel, emphatically the religion of immortality, is altogether powerless when its consolations are most needed; and that those who have maintained the contrary in their eloquent orations, have palmed upon their hearers as facts the creations of a poetical fancy. We doubt not but that there have been exaggerated accounts of death-bed scenes; where, nevertheless, piety has not only sustained, but heightened the spirit with the glory of an anticipated heaven; and we regret that things so solemn are sometimes produced for the mere purpose of effect; yet we are prepared to show that it is

both agreeable to nature and experience, that Christianity, sincerely embraced, and exerting its uncontrolled influence in forming the character, should subdue and ameliorate all those considerations which render death really formidable, and which invest it with its peculiar terrors; and that it should, moreover, inspire the sinking heart with joyful confidence, and animate the quivering lips with adoring praise.

Christianity, indeed, seems to have been constructed by its Divine Author with the especial view of destroying death, as well as of him that hath the power of death, that is—the devil. And when the Son of God left the cross for the throne, it was announced in heaven, and proclaimed on earth, as his distinguishing achievement, entitling him to universal and everlasting renown, “He hath abolished death.”

Christianity supplies all that knowledge which as a dependent, guilty, and dying creature, is necessary to make me happy; it supplies all the principles which, in their direct tendency, raise me above the fear, the agony, and the consequences of death; it furnishes me with super-added support in the divine consolations which it ever holds in reserve as a cordial for the fainting spirit in the dying hour.

In whatever view we contemplate death, Christianity is its mighty and infallible antidote. Is it a natural evil? it is compensated by an endless life. Is it the consequence of the Divine displeasure? it is mitigated by a revelation of the Divine mercy. Is it the penalty of sin? the Gospel proclaims pardon and salvation through the blood of atonement. Is it the subject of instinctive dread and terror? the Gospel altogether changes its character; under its influence it becomes not only a conquered foe, but a most munificent benefactor; it wears a heavenly smile, and instead of agonizing my heart with terror, it gently lulls it into a sweet repose. Such is the tendency of Christianity, and such, too, is its express design. But in order to this, it must be embraced; it must form the character, its doctrines and principles must be embodied in the life. It must, in fact, become religion—a personal distinction as well as a doctrinal system. In the New Testament, the Gospel is Christianity—in the believing heart, it is religion. And in this view how are we to understand it, what does it comprehend? The mere connexion which we may have with any particular church, or invisible form of Christianity, is not of the essence of religion; nothing short of the full effect of the Gospel upon a human soul can fit that soul for its eternal change. This grand distinction of human character implies illumination of mind, renovation of heart, and a practical, growing, and habitual conformity to the Divine standard, as it regards the faith which believes, the hope which anticipates, and the operation of both in the whole round of divine and human obligation, prompting

to a universal and upright obedience. The influence of this religion in death will be proportioned to its light, its vigour, its spirituality, and activity, at the moment when the awful season arrives. In instances where it has been progressive, as the light “shining more and more unto the perfect day,” the approach of death produces neither alarm nor surprise. “I have waited for thy salvation, O Lord,” was the exclamation of the Patriarch as he bowed his head and meekly yielded up the ghost.

It is not in the power of death even to interrupt the communion of the soul with its God; nor suspend for a moment his paternal care and all-sufficient consolations. Death forms no break in the course, the comfort, the joy, and the energy of the Christian life,—that life which is hid with Christ in God. If we take a more direct view of the influence of religion in death, that which is both consistent with its own tendency, and the nature and constitution of man, as sincerely, habitually, and increasingly brought under its power, we shall find that it is exerted in rendering death the consummating act of obedience—not only the last of a series, but the crowning act. “Lord Jesus, into thy hands I commend my spirit.”

Religion irradiates the last scene with the graces, and virtues peculiarly suited to its awful solemnity. In death religion has to exert its power over a new train of circumstances. Its most subtle and dangerous competitors are, indeed, retiring from the field. Health, and the buoyancy of the spirits, which so often invite temptation,—the ardour of the passions, which hurries us from God,—the pride of life, which is not of the Father,—the allurements of the world, which so often fascinate and destroy; all these vanish at the approach of death; but others remain, sufficiently formidable to require the resisting and subduing power of the faith of the Gospel. The mind is left to struggle with bodily pain; but this is soothed by a peculiar infusion of the spirit of Christ,—a spirit of holy resignation to the will of Heaven. “O!” said one, a youth aged only twenty-one years, when conflicting with the last enemy. “when I have most pain in my body, I have most comfort in my soul. What is all that I have gone through to what Christ suffered? When he, in the extremity of his pain, cried, ‘I thirst!’ he had none but enemies about him; and they gave him vinegar to drink; but when I am thirsty, every one is contriving the most salutary and pleasant draughts for me. I would not change condition with the greatest monarch in the world. I do not doubt but that there is love in the bottom of this cup. It is bitter in the mouth; however, for all that, I would not go a moment before God’s time is fully come; and I am sure that when all is over, I shall adore the wisdom and mercy of this dispensation.”

As death is the immediate precursor of judgment, and comes with all the sternness of an officer of justice, it is natural for conscience to take the alarm, and for guilt to put on all its terrors ; but here simplicity of dependence on the infinite merits of Christ, and the assured hope arising out of it—of a personal interest in his almighty care and love—interpose to silence conscience, and to set the soul at perfect rest. Apostles, confessors, and martyrs felt this. "I know whom I have believed," writes Paul the aged, to Timothy, his son in the Lord ; "I know whom I have believed, and am persuaded that he is able to keep that which I have committed to him against that day." Indeed, this firm and unshaken reliance on the atoning sacrifice of our Redeemer is the great secret of peace, and happiness, and triumph in death. But there is a natural terror in death, and how is this overcome by religion ? The love of Christ, and the manifestation of Christ to the soul in his mediatorial relations and characters, are its effectual antidote ; and by these, through the accompanying grace of the Holy Spirit, which is the common privilege of all who die in the Lord, death has not only been conquered, he has been trampled upon with a triumphant and exulting disdain. Dr. Johnson may regard this as supernatural, and may sneeringly say, that with the marvellous and the miraculous he has nothing to do ; but it is surely incumbent upon him to avow or to deny that he is a Christian. Christians know that, on the assured principles of their religion, this is a phenomenon neither contrary to nature nor experience. "Last night," said an eminent divine in the hour of his dissolution, "I had a clear, full view of death as the king of terrors ; how he comes and hurries the poor sinner to the very verge of the precipice of destruction, and then pushes him down headlong. But I felt that I had nothing to do with that ; and I loved to sit like an infant at the feet of Christ, who had saved me from this fate. Now death was disarmed ; all he could do would be to touch me, and let my soul loose to go to my Saviour." He added soon after, "Even now God is in the room ; I see him. O how unspeakably glorious and lovely does he appear ! worthy of ten thousand thousand hearts, if we had them." Again he said, "It makes my blood run cold to think how inexpressibly miserable I should now be without religion ; to be here, and see myself tottering on the verge of destruction,—O, I should be distracted."

Another evil natural to death, and which often appals the dying sinner, is the darkness in which it wraps the soul and enshrouds the future. But over the darkness of the shadow of death, religion sheds her hallowed and blessed illumination, pervading all its deep recesses with the glories of an everlasting day. "O, glory, how delightful in contemplation !" exclaimed a youthful chris-

tian pilgrim at the moment when she was terminating her earthly course ; "death is but a bridge, a step, when I look on the Lord of glory on the other side. Come, Lord Jesus, come quickly, make no long tarrying, O my God." It is said of that most devoted of Missionaries, David Brainerd, that, from time to time, at the several new symptoms of his dissolution, he was so far from being discouraged, that he seemed to be animated, as being glad at the appearances of death's approach. He often used the epithet "glorious," when speaking of the day of his death, calling it, "that glorious day ;" and the nearer death approached, the more desirous he seemed to be of it. Another Christian, after a lingering illness, and drawing near the borders of Immanuel's land, being asked how she did, replied, "Almost at home. My precious Bible ! true every tittle ; I never thought it could have supported me thus ; but it does. I never thought I could have enjoyed so much. I have not an anxious wish. It is heaven already begun ; I am happy as I can be on this side heaven." Another in the agonies of death, remarked, "Though it be very painful, I am persuaded that the longer I stay here the better it will be for me. What a charming thing it will be when I get to heaven ! There I shall see my old Christian friends, and many saints whom I never saw ; but it is a glorified Christ that will be the heaven of heavens." Being asked what he thought of heaven now, in this near view of it, he said, "Indeed I know not what to think of it ; the place, the work, the enjoyments, every thing appears so great, that I am lost, I cannot form any distinct conceptions about it. All that my soul is engaged in is Christ ; what Christ hath redeemed me *from*, and what he hath redeemed me *to*. There I can freely enlarge ; all the rest I must leave till I get there." A few hours before he died he said, "My life hath been full of toil and pain ; but I am going to an eternity of glory ; I am within sight of glory. I have a great deal to tell you, if I could but speak."

All the instances here adduced are well authenticated, and have been taken almost at random from the pages of sanctified biography with which the church of Christ is continually instructing, and, we should hope, alluring the world from the vanities which end in vexation of spirit. Dr. Johnson, if he please, may smile, and tell his readers to discredit statements which, nevertheless, we know to be true. Here is no embellishment, no romance ; and we contend that these are the natural results of a thorough knowledge of Christianity, and a sincere affiance in its doctrines and truths ; even as it is natural for infidelity, profligacy, and vice to impress certain evidences of their character and power upon those votaries and victims who have been their zealous advocates and miserable dupes. That there are large classes of human beings who live

without any distinctly marked character, and who die as they live, we are not disposed to question; and that Dr. Johnson has seen many of these pass without consciousness, without either hope or dread, into the awful presence of the eternal Judge, we are as little disposed to doubt. But we assure him, sceptical though he be, that we have met with more than one medical professor who has declared, that he has found himself almost in heaven while seated by a dying believer. He has witnessed, in a conversation maintained on the part of his friend, with supernatural energy, the scintillations of animated hope, the high pulsations of mental health, the involuntary movements of a spirit feeling itself free even in the grasp of death.

And that such cases are not more frequent, that they are not common as the Christian profession, is to be accounted for on principles that establish rather than weaken the claims of Christianity to be the only inspirer of hope and joy in death. Those instances of apparent failure, where the dying scene has presented all that is gloomy and comfortless, even though it had been preceded by a formal and sometimes sincere profession of the Gospel, may be traced either to an imperfect knowledge of the nature of justification, and a wavering reliance upon the merits of the Redeemer; to the morbid nature of dis-

ease affecting the mind as well as the body, as in the case of Cowper; or to lamentable inconsistency in the life, and a consequent irregular progress in religion. "I was called on," said Mr. Cecil, "to visit a sincere man, but who has been hurried too much with the world. 'I have no comfort,' said he; 'God veils his face from me; every thing around me is dark and uncertain.' I did not dare to act the flatterer. I said, 'Let us look faithfully into the state of things. I should have been surprised if you had not felt thus. I believe you to be sincere, your state of feeling evinces your sincerity. Had I found you exulting in God, I should have concluded that you were either deceived or a deceiver. For while God acts in his usual order, how could you expect to feel otherwise, on the approach of death, than you do feel? You have driven hard after the world; your spirit has been absorbed in its cares; your sentiments, your conversation, have been in the spirit of the world; and have you any reason to expect the response of conscience and the clear evidence which await the man who has walked and lived in close fellowship with God? You know that what I say is true.' His wife interrupted me, stating, 'that he had been an excellent man.' 'Silence,' said the dying penitent, 'it is all true.'"

THE LEAF.

In our first number, we have given an introductory article on the natural history of a leaf. Before we pursue the philosophy of the subject, our readers will not be displeased with a poetical illustration, and a theological improvement of it; the one by a universal favourite; the other by a highly esteemed member of our society.

THE FALL OF THE LEAF.

THE flush of the landscape is o'er,
The brown leaves are shed on the way,
The dye of the lone mountain flower
Grows wan, and betokens decay;
The spring in our valleys is born,
Like the bud that it fosters, to die,
Like the transient dews of the morn,
Or the vapour that melts in the sky.

All silent the song of the thrush,
Bewild'rd she cowers in the dale;
The blackbird sits lone in the bush—
The fall of the leaf they bewail.
All nature thus tends to decay,
And to drop as the leaves from the tree,
And man, just the flower of a day,
How long, long, his winter will be.

HOGG.

"We all do fade as a leaf."—ISAIAH.

Have you never been struck, reader, by the evident resemblance between the various appearances of nature, and the various states of the

human mind, as well as the successive stages of human life? If not, reflect on it, and you will find it interesting. We can easily conceive how the Divine Being might have created a perpetual variance between our condition and the state of nature around us. When he pronounced the earth accursed "for our sakes," he might have aggravated that curse, by surrounding us to a painful extent with immitigable sameness. He might have reduced the large variety of animal tribes to the few which we use for food; and have left us no quadruped to please us with its gambols—no insect to sport in the summer's sun—no birds to delight us with their flight and their song. He might have taken away all the beauty of the landscape, by commanding the hill to sink and the valley to rise to a perfect level—by sinking the torrent and the rivulet beneath the surface of the earth—and by substituting for the towering and luxuriant tree nothing but the thorn and the brier. And from this scene he might have commanded the moon and the stars to withdraw their light, and have permitted the sun to look upon it only through a cloud. And had the face of nature worn an aspect so dreary, he doubtless would have counted himself most happy, or rather least miserable, who could have secluded himself most effectually from beholding it. But so far from being surrounded by such a

scene, paradise was not more adapted to man in his state of primeval purity, than the present condition of nature corresponds with our altered circumstances.

We know not to what extent the fall of man affected the original constitution of nature. In the poetic eye of Milton,

"Sky lowered, and, muttering thunder, some sad drops
Wept at completing of the mortal sin
Original."

But this, if more than poetically correct, was only a presage of approaching revolution. From the tenour of the curse, we learn that a material change, never to be revoked, immediately followed. Nor do we know the effects produced by the universal deluge, and by other convulsions of nature. But whatever they may have been, we find ourselves the passing inhabitants of a world where nature, animate and inanimate, seems to sympathize with our lot, to point out our duties, and to remind us of our end. Nature, in this light, is only a grand depository of means intended to promote the end of our being. It is a temple in which piety finds herself surrounded by a thousand emanations from the Supreme, and addressed by a thousand voices of warning and encouragement. The poet has drawn from it his most pathetic images—the moralist many of his best arguments and examples—and the prophet some of his most arousing monitions.

In exemplification of this fact, but without pretending to furnish an adequate idea of it, you may be reminded of a few of the more obvious illustrations of our condition with which nature abounds. How often is the restlessness of man compared to the constant agitation of the ocean; and the uncertainty of friendship, and of success in life, to the instability of that element. How beautifully does the setting of the unclouded sun illustrate the closing scene of the Christian's life; how friendly the calm and twilight of evening are to solitude and meditation; and how aptly the rage of a storm represents the frequent turbulence of human passions. If life be compared to a day, it has its morning, its noon, its evening, and its night; and when compared with the year, it has its "flowering spring," its "summer's ardent strength," its

"Sober autumn fading into age;
And pale concluding winter comes at last
And shuts the scene."

No subject, however, has been more copiously illustrated, by comparisons drawn from nature, than the brevity and uncertainty of human life. The change continually passing upon every thing around us, can scarcely fail to remind even the most thoughtless that such, "in his best estate," is man. But it is an unwelcome subject to the majority of mankind, and often remanded, like Paul by Felix, until a more convenient season shall have arrived. It cannot, however, be dis-

missed at present on account of its unseasonableness, for scarcely can we walk out without being reminded of it by some striking emblem. The warmth of summer is gone, and the freshness of the grass. The tribes of insects have gradually disappeared, and those which Providence instructs to provide for the winter, have begun to live on the fruit of their industry. The trees have lost the beauty and luxuriance of their foliage; for while some of them are already left naked to the blast, the leaves which remain on the rest have become sere and yellow, and every breath of air diminishes their number. The birds are become silent, and the sun leaves us in darkness early in the day. Here then is a silent but an eloquent appeal to our hearts, and surely no one can be offended when nature itself becomes the instructor. Had we, by any possibility, been ignorant that all the preceding generations of men had died, and that the same event awaited us, who could go out and contemplate those images of desolation, without wondering whether a change would ever take place in our condition, answering to this change in the aspect of nature? But this is not a subject of conjecture—we *know* that it is the lot of all, and nature only aims to remind us of it. We are too much disposed to act as though the winter of our life would never come. But nature addresses us in the tone of warning, and assures us that it will; and presents itself as an example. We are so far absorbed in the present concerns of life, that we are in extreme danger of forgetting what awaits us at the end. But, as if to prevent this fatal inattention, nature dies before our eyes. It prospectively celebrates our funeral; and while the funeral procession is passing before us, the voice of wisdom pronounces in solemn accents, "We all do fade as a leaf."

And is it so, reader?—Then act as though you believed it. And remember that the portion which awaits the Christian, when he has faded and fallen here, is "an inheritance, incorruptible, undefiled, and that fadeth not away." His body too, like seed deposited in the earth, is eventually to burst into second life. It is designed to wear no earthly form, but to be "fashioned like unto Christ's glorious body." And at the same moment a new heaven and a new earth are to start into being likewise. Not more certainly will the present season give place to another spring, than the storms and vicissitudes of time will be succeeded by that glorious event. To secure that, the Saviour died; and to accelerate it, he lives, and reigns, and triumphs. It is that to which all the affairs of the universe are hourly tending. Then a summer shall flourish which shall know no winter; then the verdure shall never wither; and the blessed who enjoy it, freed from every thing which rendered them fading on earth, shall know no change but that of advancing "from glory to glory."

"VÆ VOBIS." *

"Væ vobis," ye, whose lip doth lave
So deeply in the sparkling wine,
Regardless though that passion wave
Shut from the soul heaven's light divine.

"Væ vobis!"—heed the trumpet blast,
Fly, ere the leprous taint is deep,
Fly!—ere the hour of hope be past,
And pitying angels cease to weep.

"Væ vobis," ye, who fail to read
That name which glows where'er ye tread,
The Alpha of an infant creed,
The Omega of the sainted dead.
'Tis written where the pencil'd flowers
Their tablet to the desert show,
And where the mountain's rocky towers
Frown darkly on the vale below :

* "Woe unto you."

Where roll the wondrous orbs on high,
In glorious order strong and fair,
In every letter of the sky
That midnight graves,—'tis there—'tis there !
It gleams on Ocean's wrinkled brow,
And in the shell that gems its shore,
And where the solemn forests bow
"Væ vobis," ye, who scorn the lore.

"Væ vobis," all who trust in earth,
Who lean on reeds that pierce the breast,
Who toss the bubble-cup of mirth,
Or grasp ambition's lightning-crest,
Who early rise and late take rest,
In mammon's mine the care-worn slave,
Who find each phantom race unblest,
Yet shrink reluctant from the grave.

L. H. SIGOURNEY.

ENTOMOLOGY.

SPIDERS.

THE ingenuity displayed by these interesting creatures, in accomplishing objects which they at any time require, is truly admirable. They are in themselves a fine study, and discover art in nature beyond what intellect and science have ever taught to the sons and daughters of reasoning humanity. "I have often observed," says a gentleman who has paid considerable attention to entomology, and especially to the habits of spiders, "the peculiar manner in which the little animal throws his web across from one object to another, through empty space. There are two ways in which it is principally done; the one is to fasten the end of the thread to an angle of a fence, or any other object similarly situated, and then to proceed along until it reaches an opposite angle, taking the precaution of keeping it from coming in contact with any of its parts, by projecting one of its posterior limbs, through the claw of which the thread is made to glide, in such a manner as to be kept nearly an inch from the wall. After having reached a situation suitable to its purpose, the slack of the web is speedily taken in, and the end firmly secured as before. This acts as the basis-line from which the others are extended in various directions. The second mode is, for the spider to ascend some eminence, and then, by elevating the abdomen, rapidly to dart out threads, so extremely fine as almost to elude the observation of the spectator, until they reach some neighbouring object, along which it then, with unusual speed, pursues its course, at the same time spinning out a much stronger line, and one far thicker in its dimensions.

"With the view of deciding the question, how spiders contrive to extend lines which are often many feet in length, across inaccessible openings, we are indebted to the Rev. Mr. Kirby for the following experiments; for the idea of which he

refers to the writings of Mr. Knight, who informs us, that if a spider be placed upon an upright stick, having its bottom immersed in water, it will, after trying in vain all modes of escape, dart out numerous fine threads, so light as to float in the air, some one of which, attaching itself to a neighbouring object, furnishes a bridge for escape. He says further,—'I accordingly placed the large garden spider upon a stick about a foot long, placed upright in a vessel containing water. After fastening its thread (as all spiders do before they move) at the top of the stick, it crept down the side until it felt the water with its fore feet, which seem to serve as antennæ; it then immediately swung itself from the stick, which was slightly bent, and climbed up the thread to the top; this it repeated perhaps a score of times, sometimes creeping down a different part of the stick, but more frequently down the very side it had so often traversed in vain. Wearied with this sameness in its operations, I left the room for some hours. On my return I was surprised to find my prisoner escaped, and not a little pleased to discover, on further examination, a thread extended from the top of the stick to a cabinet seven or eight inches distant, which thread had doubtless served as its bridge. Eager to witness the process by which the line was constructed, I replaced the spider in its former position. After frequently creeping down, and mounting up again, as before, at length it let itself drop from the top of the stick, not, as before, by a single thread, but by two, each distant from the other about the twelfth of an inch, guided, as usual, by one of its hind feet, and one apparently smaller than the other. When it had suffered itself to descend nearly to the surface of the water it stopped short, and, by some means which I could not distinctly see, broke off, close to the

spinners, the smallest thread, which, still adhering by the other end to the top of the stick, floated in the air, and was so light as to be carried about by the slightest breath. On approaching a pencil to the loose end of this line it did not adhere from mere contact; I therefore twisted it once or twice round the pencil, and drew it tight. The spider, who had previously climbed to the top of the stick, immediately pulled at it with one of his feet, and finding it sufficiently tense, crept along it, strengthening it, as it proceeded, by another thread, and thus reached the pencil.'

"A writer in the *Journal de Physique* asserts, on actual observation, that he saw a small spider, which he had forced to suspend itself by its thread from the point of a feather, shoot out obliquely, in opposite directions, other smaller threads, which attached themselves, in the still air of a room, without any influence of the wind, to the objects towards which they were directed. He therefore infers, that spiders have the power of shooting out threads, and directing them at pleasure towards a determined point, judging of the distance and position of the object by some sense of which we are ignorant. Whereupon, Mr. Kirby remarks, that he once witnessed something like this manœuvre in the male of a small garden spider (*Aranea reticulata*). 'It was standing midway on a long perpendicular fixed thread, and an appearance caught my eye of what seemed to be an emission of thread from its projected spinners. I therefore moved my arm in the direction in which they apparently proceeded; and, as I suspected, a floating thread attached itself to my coat, along which the spider crept.' Another authority is from an article contained in the transactions of the Linnean Society, in which its able writer states, that 'having procured a small branching twig, I fixed it upright in an earthen vessel containing water, its base being immersed in the liquid; and upon it I placed several of the spiders which produce gossamer. Whenever the insects thus circumstanced were exposed to a current of air, either naturally or artificially produced, they directly turned the thorax towards the quarter whence it came, even when it was so slight as scarcely to be perceptible; and elevating the abdomen, they emitted from their spinners a small portion of glutinous matter, which was instantly carried out in a line, consisting of four finer ones, with a velocity equal, or nearly so, to that with which the air moved, as was apparent from observations made on the motion of detached lines similarly exposed. The spiders, in the next place, carefully ascertaining whether their lines had become firmly attached to any object or not, by pulling at them with the first pair of legs; and if the result was satisfactory, after tightening them sufficiently, they made them fast to the twigs; then discharging from their spinners, which they applied to the spot where they stood, a little more of their liquid

gum, and committing themselves to those bridges of their own constructing, they passed over them in safety, drawing a second line after them, as a security in case the first gave way, and so effected their escape.'

"I shall now conclude this communication with a brief description of the whole process, which I had an excellent opportunity of witnessing a few mornings since, even whilst the above letter was still in my possession. It was accomplished by one of the larger species of hunting spiders, that are so commonly met with along the walls and palings of our gardens during the more genial seasons of the year. When first observed, it had taken its station upon a superior corner of a piece of joist, about four inches square, and which projected three feet and a half beyond the building to which it was attached. Its abdomen was elevated in the air, and it was apparently, with great industry, spinning out its web, no doubt with the intention of reaching the nearest object to his position, which proved to be a plum-tree, situated nearly four feet distant. This web was so exceedingly fine, that a considerable time elapsed ere I could readily discern it floating most gracefully in long undulations upon the light morning air. In a short time I observed that it had become entangled in one of the smaller branches of the tree, which the spider almost instantaneously discovered, and after once or twice tugging at the line with its anterior feet, in order to ascertain that it was sufficiently secure, it suddenly, and with great force, launched out upon its aerial voyage, but not, however, before it had taken the precaution of firmly cementing an additional and much stronger thread to the point from whence it started. The utility of this measure soon became very apparent, for it had scarcely proceeded a few inches on this slender bridge, before the light thread suddenly disunited from the weight alone, when the spider was left freely swinging to and fro by the larger line, three or four inches beneath the joist, otherwise perfectly free from injury. It soon, however, regained its former position, and, with an industry fully equal, was soon again employed in a process in every respect precisely similar to that which preceded. Once again, however, it was its destiny to meet the same result; but the third attempt proved perfectly successful, and, with a rapid motion, I soon beheld it reach the desired position. The object of this spider in changing its situation was, unquestionably, for the purpose of procuring with more facility its ordinary food; for I beheld, in great numbers, a small species of *musca* rapidly traversing several branches of the plum-tree, and particularly that one upon which it had landed. Upon continuing my observations of this hunter, I was highly amused to see the cat-like caution with which it stole along the opposite side of the branch towards a position where several of these insects

were assembled, quietly regaling themselves upon a portion of the gum which had exuded from the tree; sometimes running for a short distance with uncommon speed, then resting for some moments, as if for reflection, and so alternately moving onward until it came within several inches of the intended spot; it now proceeded with much greater care, occasionally pausing, and slowly projecting its head around the branch, as if to ascertain its true approximation. At length, after approaching within a few inches to where

the flies appeared, it gradually stole to the upper surface of the branch, and then became perfectly motionless; and so it continued for some moments, as if to select a victim from among their number, and for the purpose of making a more sure and deadly aim. The favourable moment having now occurred, it all at once, and with a motion almost as rapid as the light, sprang through the air immediately upon one of the flies, and soon bore it away triumphantly to some secluded recess among the leaves." E.

HOME.

O HOME, my loved home! welcome thou to my heart,
In childhood, in youth, I have loved thee;
While reluctant and slow from thy threshold I part,
I return with the speed of the swift-footed hart;
Of my wandering soul thou the resting-place art;
In sorrow, in joy, I have proved thee.

Other climes may be light, other scenes may be fair,
With delight I may gaze on them ever;
But O! none with my long-cherish'd home can compare,

My earliest joy, and my earliest care;
I may roam o'er the earth, but my heart will be there,
No distance that union can sever.

The bright lamp of day hath sunk low in the west,
But shall rise again glorious to-morrow:
So the heart that's afflicted again shall find rest
By the smiles of contentment and virtue caress'd,
Again with the home of its soul shall be bless'd,
No more to feel sighing and sorrow.

S.

SAYINGS AND DOINGS.

BON MOR.—A country gentleman of the name of Pepper, had been several times thrown from a spirited young horse, and was one day relating the circumstance to his friend Lord N., at the same time observing that he had never given his horse a name. "I think," replied Lord N., "you should call him Pepper-caster."

A PREP BEHIND THE SCENES.—In the "Conversations and Recollections of Coleridge" we have the following interesting facts, illustrative of the honour and honesty which sometimes distinguish the conductors of the periodical press:—"Clarkson (the moral steam-engine, or giant with one idea,) had recently published his book, and being in a very irritable state of mind, his wife expressed great fears of the effect of any severe review in the then state of his feelings. I wrote to Jeffrey, and expressed to him my opinion of the cruelty of any censure being passed upon the work as a composition. In return I had a very polite letter, expressing a wish that I should review it. I did so; but when the Review was published, in place of some just eulogiums due to Mr. Pitt, and which I stated were upon the best authority, (in fact they were from Tom Clarkson himself,) was substituted some abuse and detraction. Yet Clarkson expressed himself gratified and satisfied with the effect of the review, and would not allow me to expose the transaction. Again, Jeffrey had said to me that it was hopeless to persuade men to prefer Hooker and Jeremy Taylor to Johnson and Gibbon. I wrote him two letters, or two sheets, detailing at great length my opinions. This he never acknowledged; but in an early number of the Review, he inserted it at length, and added at the conclusion, as his own words, to this effect:—"We have been anxious to be clear on this subject, as much has been said on this matter by men who evidently do not understand it. Such are Wordsworth, Southey, COLERIDGE, and Miss Baillie."

POLLY LEITON.—"My longest visits," says Count Segur, "were paid to a very silent old man, who very rarely uncovered his thoughts, and never his head;

his gravity, his monosyllables, proved sufficiently at our first meeting that he was a Quaker; notwithstanding I must own, that, in spite of my esteem for his virtue, our first interview would have been our last, but that, on a sudden, a door opened, and a being entered the parlour, who seemed to be a nymph rather than a mere woman; I never saw one who united so much elegance to so much propriety of appearance. It was Polly Leiton, the daughter of my grave Quaker. Her dress was as white as herself, whilst the ample muslin of her neckerchief, and the envious cambrics of her cap, scarcely allowed me to see her light-coloured hair; in short, the simple adorning of this pious maiden vainly endeavoured to conceal the finest form and the most engaging features. Her eyes appeared to reflect, as in two mirrors, the sweetness of a pure and tender soul. She received us with a degree of confiding ingenuousness that charmed me; and the language of *thee* and *thou*, which her sect prescribes, gave to our new acquaintance an air of old friendship. I doubt whether the finest work of art could ever eclipse this the finest work of nature, (*le chef-d'œuvre de la nature*), as the Prince de Broglio called her. In our conversation she surprised me by the candour and originality of her questions. 'Thou hast, of course,' said she, 'neither wife nor children in Europe, as thou hast quitted thy country, and art come to such a distance in order to carry on the hateful trade of war.' 'But it is for your sakes,' I replied, 'that I have left all that is dear to me, and it is to defend your liberties that I come to fight against the English.' 'The English,' answered she, 'have done thee no harm; and what does our freedom signify to thee? One ought never to meddle with other people's affairs, except it be to settle them amicably, and to prevent the shedding of blood.' 'But my king,' I rejoined, 'has commanded me hither, to bear his arms against your enemies and his own.' 'Well, then,' said she, 'thy king has commanded thee to do what is unjust and inhuman, and that is contrary to the commandments of thy Maker. Thou shouldst

obey thy God, and disobey thy king; for his kingly power is only given him to save, and not destroy. I am very sure that thy wife, if she have a good heart, is of my opinion.' What could I say in answer to this angel? for, in truth, I was tempted to believe her one. It is very certain, that had I not been married and happy, whilst defending the liberty of America, I should have lost mine to Polly Leiton. The impression made on me by a charming young woman was of so different a nature to that which I had experienced in the brilliant whirlpool of the world, that, for a while, she banished from my mind all ideas of concerts, balls, and entertainments."

SIR R. PHILLIPS.—Sir Richard Phillips, the bibliopoliſt, who, at the beginning of the preſent century was equally the patron and the terror of authors by profeſſion, the envy of his brethren, and the laughing-stock of the city, is thus noticed by Coleridge:—

"Phillips left Nottingham, where he had juſt eſtabliſhed himſelf, at an early age. He afterwards kept a hosiery ſhop in St. Paul's, and ſold the 'Magazine' (the Monthly) at the back. He uſed to boaſt that he could do more by puffing than all the other booksellers. It is certain that he was a great annoyance to them at one time. He had a hoſt of writers in his pay, whom, however, he never retained. A groſs flatterer, I recollect hearing him addreſs ſome fulſome compliments to Dr. Beddoes, to which the Doctor appeared to liſten with patience. He was, after a peroration of ten minutes' duration, told by the Doctor that he was wrong in his chronology.

"'Not right in my chronology?' ſaid the ſurpriſed bookseller; 'what has chronology to do with the matter?'

"'Only this—that, ſo far back as the year 1540, this kind of complimentary inſult had become obſo-lete!'

"The knight ſaid no more, but decamped at once.

"Once, when in an abſtruſe argument with Mrs. Barbauld on the Berkleian controversy, ſhe exclaimed, 'Mr. Coleridge! Mr. Coleridge!' The knight was preſent. No ſooner did he hear my name mentioned than he came up to my chair, and after making ſeveral obſequious obeiſſances, expreſſed his regret that he ſhould have been half an hour in the company of ſo great a man without being aware of his good fortune; adding ſhortly afterwards, 'I would have given nine guineas a ſheet for his converſation during the laſt hour and a half!' This, too, at a time when I had not been at all publicly known more than a month. He avowed indeed, afterwards, that he never feared offending by flattery, being convinced that, for one man who was offended, ninety-nine were pleaſed with that which, if preſented to others, they would have deemed naueaſing and diſgusting."—*Letters, &c.*, vol. ii.

INDIA RUBBER CARPETS.—Dr. Jones, of Mobile, in a letter to profeſſor Silliman, ſays, "Having ſome India rubber varniſh left, which was prepared for another purpoſe, the thought occurred to me of trying it as a covering to a carpet, after the following manner: A piece of canvass was ſtretched and covered with a thin coat of glue, (corn-meal ſize will probably answer beſt,) over this was laid a ſheet or two of common brown paper, or newspaper, and another coat of glue added, over which was laid a pattern of houſe-papering, with rich figures. After the body of the carpet was thus prepared, a very thin touch of glue was carried over the face of the paper, to prevent the India rubber

varniſh from tarniſhing the beautiful colours of the paper. After this was dried, one or two coats, as may be deſired, of India rubber varniſh, were applied, which, when dried, formed a ſurface ſmooth as poliſhed glaſs, through which the variegated colours of the paper appeared with undimiſhiſhed, if not with increaſed luſtre. This carpet is quite durable, and is impenetrable to water or greaſe of any deſcription; when ſoiled it may be waſhed, like a ſmooth piece of marble or wood. If gold or ſilver leaf forms the laſt coat, inſtead of papering, and the varniſh is then applied, nothing can exceed the ſplendid richneſs of the carpet, which gives the floor the appearance of being burniſhed with gold or ſilver.

METAPHYSICS.—A Scotch blackſmith gave the following definition of metaphyſics:—"Twa foulk diſputen tighether, he that's liſtenin diſna ken what he that's ſpeakin means; and he that's ſpeakin diſna ken what he means himſel,—that's metaphyſics."

INSCRIPTION FOR A CHIMNEY-BOARD.

HERE lie entombed
the aſhes, earthly parts, and remains,
of a bright and aſpiring genius,
who, in his youth,
diſcovered ſome ſpark
of a brilliant and volatile nature;
but was, in maturity,
of a ſteady and grateful diſpoſition,
and diffuſing benevolence.

Though naturally of a warm temper,
and eaſily ſtirred up,

yet was he a ſhining example
of fervent and unreſerved benignity.

For though he might have been
the moſt dangerous and dreadful
of enemies,

he was the beſt and kindeſt
of friends.

Nor did he ever look cool
even upon his foes;
though his fondeſt admirers
too often turned their backs upon him.

O, undeſerving and invidious times!
when ſuch illuſtrious examples
are thus wantonly made light of,—
ſuch ſplendid virtues
thus baſely blown upon.

Though rather the promoter of a cheerful glaſs in others,
and ſomewhat given to ſmoking,
yet he was never ſeen in liquor,
which was his utmoſt abhorrence:
raking, which ruins moſt conſtitutions,
was far from ſpoiling him,
though it often threw him into inflammatory diſorder.

His days, which were ſhort,
were ended by a gentle and gradual decay;
his ſubſtance waſted and ſtrength conſumed.

A temporal period was put to his finite exiſtence,

by his being ſeized with a cold
in one of the wanton days
of the fatal month of May.

His loſs and cheering influence
is often and feelingly lamented

by his friends,
who erected this monument in memory
of his endearing virtues.

A SCOTTISH SABBATH.

CHAPTER I.

It does not seem doubtful, or rather, we may say, it is absolutely certain, that the foundation of all idolatry, be it of how degrading and revolting a character it may, is what is called "natural religion,"—the breathing of the finite created spirit after the infinite spiritual God—the "law of the mind," as Paul expresses it. In all heathen countries, where any advance has been made in civilization and the arts, designing men have used every effort to turn this principle into the instrument of their own purposes. The rudest of all people which have been introduced to our notice in modern times, the aboriginal inhabitants of Australia, had no temple, no idol, no consecrated substance, or sacred place. Their memories did not reach further back than the preceding generation; but still, when they were asked whither their fathers had gone, they pointed upward to the sky in dumb though solemn veneration. The red Indians of North America, still a rude and ignorant people, but far more intellectual than the native Australians, worshipped "the Great Spirit;" and, although some of them had symbolic objects, as for instance the "stone" of the Oneidas, yet these were national rather than idolatrous; and "the Great Spirit" was worshipped by them in the same manner as by those who had no symbolic substance.

The whole tenour of human history shows, that it is only after considerable advances have been made in the arts of life, and when certain individuals of the human race have begun to ply their arts of turning the great body of the people to their own advantage in the way of gain, of glory, or of both, that the temple has been built, and the idol fashioned. Something more gorgeous and imposing than the people are usually accustomed to, something which can attract and captivate the senses. To give the "law in the members" the victory over the "law of the mind," is what has all along been required, and is still required, for producing this effect. What and how much may be necessary, depends of course upon the condition of the people. A queen of savages is delighted with a glass bead; a European queen cares for nothing less costly than a diamond, and not much for that, unless it is of considerable size and price.

It is the same in the case of those idolatries, in which those who have a personal worldly interest in so doing, go about to transfer to the temple and the idol that worship and veneration which the spontaneous feeling of even the rudest mind would give to God only. Any one who is conversant with the history of nations, will easily perceive that there is no exception to this. A rude stone, smeared over with red ochre, is a god

to the simple Hindú; and a few stones built up under the shade of a tree, and daubed over with lime, is a temple. If tasteless magnificence is the character of the people, then the shapeless idol is loaded with precious metals and costly stones, and clothed with robes of great price; while the size of the temple, and not the symmetry, is the quality upon which its claim to the veneration of the people is rested. The idols of the Mexicans and Peruvians were costly in their ornaments, but hideous in their forms; the temples of the same people were vast in their dimensions, but destitute of every pretension to elegance. These have gone the way which all idols, whether heathen or pretended Christian, must go some day or other; but there are still analogous cases in some parts of the East. The polished Greeks and the luxurious Romans required idols and temples of a different character; and we still admire the remains of the one, and the ruins of the other, as among the choicest productions of human taste and skill. In all the varieties, however, the object has been the same—to take the senses captive by the material display, and thus withdraw the longing of the mind from the invisible God, who, to be worshipped at all, must be worshipped in spirit.

Some may suppose that these remarks have nothing to do with any Christian observance, and especially with "A Scottish Sabbath." The fact is, however, so much at variance with this supposition, that, without some such means as we have stated, it is impossible to judge rightly of Christian worship, or duly to appreciate the peculiarities of the "Scottish Sabbath."

Mankind are in precisely the same condition at their birth, in a land of the purest and most enlightened Christianity, as they are in one of the most benighted savagism; and if a child, immediately on its birth, were to be transported from the one to the other, it would not fail to grow up in all the habits and customs of the country to which it was taken. Mental qualities and mental acquirements are not in the slightest degree hereditary, though there are bodily qualities transmissible, especially from the mother, that appear to fit the body, much better in some cases than in others, for being the informant of the mind from without, and its servant in the execution of its purposes.

It follows, as a necessary consequence of this, that those upon whom the religion of the Gospel has not yet come in its power, but who are merely mocking the true God in his temple, stand in jeopardy of being carried away by the pomp of a highly ornamented church and an imposing ritual, so as to mistake the exhibition and the observance for the essentials of religion; and

thereby turn, at least virtually, the Christian church into a heathen temple. Hence, the more simple the service, the more conducive it must be to the interests of true religion. Splendid cathedrals, titled ministers, pompous ceremonies, and pealing organs, have really nothing to do with the "still small voice" which calls to those who are without Christ, "what dost thou here?" The Lord is not in the great wind, the earthquake, or the fire, at the present time, any more than in the days of Elijah the Tishbite. The voice of religious instruction to the ear must be an audible voice; and the less it is drowned or disturbed by other sounds, it will do its office the better; but the voice which reaches the inner man—the immortal spirit—"in demonstration of the spirit and with power," is, if the expression may be allowed, a *silent* voice, in so far as any or all of the senses are concerned. If the spirit is to be instructed, the senses must be still the while. All the observances of the Scottish church are more simple than those of any other church having the name of "Established" or "National." The beneficial effects of this are visible in many things, but perhaps not more in any than in the Scottish Sabbath.

It is perhaps as well that the name "Sabbath" has not been used as the common name of the first day of the week, or hebdomadal commemoration of the resurrection of the Saviour. "Sunday" (the sun's day) has been retained, and it was used by the Pagans long before their conversion to Christianity. In London Sunday is any thing but a Sabbath-day of rest, upon which, as is duly set forth on the tablet at the legal side of the altar in every episcopal church, "thou shalt not do any work, thou nor thy son, nor thy daughter, thy man-servant, nor thy maid-servant, nor thy cattle, nor the stranger that is within thy gates." Any one who compares this with what is really done in London on the Sunday, would very naturally conclude that it is set up in the churches in derision of the sacred volume, and defiance of the almighty Lawgiver. Those who have been a Sunday in London, and have used their eyes, require no additional evidence on this subject; and those who have not may find ample proofs in the notes to the clear and practical, and, as we may say, manly sermon delivered by the Rev. John Harris, of Epsom, before the London City Mission, Dec. 6th, 1836.

London is, of course, much worse in this respect than the rural districts, because the greater the multitudes the more abundant is the following of that multitude to do evil. But still we are not aware of any district in England in which Sunday is hallowed as a Sabbath. The cattle rest nowhere, in the largest sense of the word; the servants, and even the labourers who live in their own cottages, very seldom. Even a Sunday dress, different from the common working clothes of the week, is rare among the English

rustics. Many, no doubt, go to church in a clean smock frock; but there are also many who loiter about the fields, hedges, and alehouses, in the same dirty and self-neglected style as so many of the labourers do in the purlieus of London. Fiscal regulations do not appear to have the least influence upon this, for they have been much multiplied of late; and the increased neglect of the Sabbath has increased still faster. Such being the case, it is pretty obvious that parliamentary interference would be just as unavailing. Both the evil and its cure, if cure it admits of, lie in quite another direction, in which it is not our present object to follow them.

In Scotland the case is different, though fiscal regulations on the subject are comparatively few there. The people of Scotland are certainly not better at the time of their birth, for morals are not more hereditary than knowledge. The person who offends in Scotland is, also, generally, a worse character than he who offends to the same extent in England, because he breaks a stronger chain of examples. In the towns of Scotland the first day of the week is less of Sabbath than it is in the country, though more so than in an English town of the same size and class; but the contrast should be taken in the country districts, which are, in the great bulk of their population, free from the influence of the towns. Hence we shall take such a district.

The church is a very simple structure, often without tower or spire, but generally with a small belfry, though sometimes the bell is suspended on a post, or in a tree. The church is usually in a beautiful situation, more especially if it is an old one; it is almost invariably in a clump of trees, and very often on a gently-swelling knoll, near the bank of a clear rivulet, which, when favourable for such a purpose, often also turns a mill. Such a church is really a very pleasing object to a feeling mind; and though it has not been consecrated by any formal rite, it is hallowed to the people as well for being the scene of their religious instruction, as from the fact that the bones of their fathers are deposited in the little green mounds around. We know not what influence the hearing of the word of God, surrounded by the bones of their ancestors, and the fact of meditating among the tombs during the interval between the morning and the evening service, may have upon the rustic youths of Scotland; but these things must have some influence, and it cannot be bad. There are memorials there

"With uncouth rhymes and shapeless sculpture decked;" and besides "holy texts," there are other monitors

"To teach the rustic moralist to die."

Often may then be seen some ancient man, hoary with age, and bent with toil, who yet has

the tinge of health and the lines of contentment and hope upon his face, separating from his companions, and pacing slowly toward the grassy turf which covers the remains of the partner of the years of his prime, and haply some of the pledges of their simple attachment, as if, in the impressive language of Dr. Watts, he had gone alone to

"View the ground
Where he must shortly lie."

It may, it will happen, that during this silent survey the eye will fill, the curved body bend more lowly upon its staff, and the sod shall be watered with tears at the recollection of days

that are gone; but the pang is momentary, for the consolations of true religion are inseparable from his mind.—"graven with an iron pen and lead in the rock for ever." The glance upward says, more forcibly than if the words were spoken,—"I know that my Redeemer liveth, and that he shall stand at the latter day upon the earth: and though after my skin worms destroy this body, yet in my flesh shall I see God." Thus having breathed his hope, he joins his companions, and the "in-ringing" bell begins to tinkle.

Such a parish is delightful all the week, but the Sabbath and its services are the choice portion, and to them we shall briefly advert in a second chapter.

THE TEE-TOTALERS.

"WHEN the devil sees that he cannot stop the coach, he jumps on the box, and takes the reins, in the hope of overturning it." Such appears to be his policy in relation to temperance societies. Of the existence of such societies our readers are doubtless aware. For our own parts, we not only admit their necessity, we admire and advocate them, and believe that they have already effected much good. We cannot but grieve, therefore, at the martyrdom they are enduring, especially in some parts of America, at the hands of misguided friends, who have even banished the use of wine from the sacred ordinance of the Lord's Supper, and seriously deprecate the growth of the vine. It is, we suppose, with the intention of placing such pernicious excesses in their proper light that an esteemed correspondent sends us the following account of a Scientific Tee-Total Meeting, recently held at the "Water-Butt Rooms," Well-street, Rainville, county Maine.

On entering we found the room crowded with (what on any other occasion we should have called) *ardent spirits*. Among a number of appropriate symbolic decorations, two flags, suspended over the chair, were particularly conspicuous; the one, apparently burning with flames, in the midst of which the black letters ALCOHOL, were made to writhe about like so many tortured imps; the motto, *A burning shame*: the other, with the sign of Aquarius, the water-bearer, apparently pouring a refreshing stream on the head of the venerable chairman, P. Drinkwater, Esq., with the motto, *Water for ever*.

The chairman, on rising, congratulated the meeting on the favourable auspices under which they met. The very elements, he remarked, seemed to smile on their object, it having been raining in torrents all day. (Hear, hear.) This, doubtless, accounted for the presence of so many friends. He earnestly hoped that no one present was so inconsistent as to use an umbrella, or to wear any waterproof article of dress. (Cheers;

and a bustle at the lower end of the rooms, with cries of, Turn him out.) The disorder was occasioned by the timely discovery of a daring intruder actually wearing a Macintosh cloak. Order having been restored by his instant expulsion, the venerable chairman continued:—Your dripping appearance proves that you do not. For his own part, he was happy to say, that he had been the honoured instrument of buying up and destroying no fewer than thirteen umbrellas, and six waterproof hats, that blessed day. (Cheers.) Would that he possessed the requisite authority, he would as cordially issue an order for the demolition of all such vile innovations, as for the destruction of so many mad dogs. And this, by the way, reminded him of hydrophobia—(Hear, hear)—the most unnatural, the most monstrous of all monstrous diseases. Hate water! (Here the meeting was sensibly affected.) Ungrateful man! This came of alcohol. Was hydrophobia ever heard of before alcohol came into use? Had any one ever heard of a member of the Tee-Total Society dying of hydrophobia? He challenged the world to produce an instance. It was his firm belief that hydrophobia was nothing else than demoniacal possession. And hence, as if in spite, it had of late, as was to be expected, greatly increased; for what were they but an anti-hydrophobia association?

He must apologize for his length and warmth; but abstinence was a subject on which temperance was a sin. Nothing but his deep sense of the importance of the object could have brought him out that evening; for he found that as life advanced infirmities increased. His infirmity, however, called for gratitude rather than complaint; for it was, and he was proud to own it, an *aqueous humour*. This reminded him that at the last meeting he had been asked two important questions; 1st, what disease was to be most deprecated next to hydrophobia? He had now no hesitation in replying, *diabetes*. And, 2nd, which is the most desirable for the termination

of life? He must be unworthy of the post he had the honour to fill in that society, if he did not boldly reply the *dropsy*. (Loud cheering.)

On the chairman resuming his seat, a murmur went round that the rain had ceased, which threw a momentary damp on the assembly; till the secretary, having read the minutes of the last meeting, proceeded to congratulate the society on the rapid progress their views were making. Ten wine-cellars and four breweries had been shut up, several public fountains opened, and more than five wells drained completely dry. If this did not show the public feeling he knew not what could. (Cheers.) He would read to them the following letters, just come to hand, in the contents of which he was sure they would take the deepest interest. The first was dated from "Tee-total Hall, and ran thus:—

"MY DEAR SIR,

"It is our privilege to live amidst the light of the 19th century, and the liberty of America. What were the boasted discoveries of a Newton, compared with the discoveries and principles of the Tee-totalers? Let us act worthy of the name. I wish to live only to honour it. But of this you shall yourself judge. I have quite destroyed the new grapery, root and branch; though it occasioned, among some of the members of my family, what I may well call a *vinous fermentation*. You remember the walk that leads from the high road up to my house—you will be delighted to hear that I have erected an iron frame to span the entrance, like a gallows; from which a bottle, marked *alcohol*, is seen hanging in *terrorem*. My only fear is, that the vile thing suspended may injure the reputation of the gallows. It is with no small pleasure—perhaps I might be excused for saying *pride*—that I can at length announce the completion of an invaluable little instrument, to be called the *alcoholometer*; which can be easily carried about, and constantly employed to detect the presence and determine the quantity of alcohol in any given substance. For my part, I am quite horrified to think what I have been ignorantly eating and drinking; for, on applying the *detector* yesterday to thirty different articles of food, judge my dismay at discovering the presence of alcohol in no less than twenty-nine. I know not now what I should do with out it.

"My little thermometer project succeeds wonderfully; the mercury never rising, now, above *temperate*, even in the hottest season: this is a great desideratum for a Tee-totaler. But I must conclude. This day is to be devoted to a delicate investigation. The wise Pythagoras says, *A fabis abstineto*—"abstain from beans:" and I am determined to see whether the vulgar interpretation of the admonition—that his disciples should abstain from election matters, in which beans were used for votes—be the right one; or whether, as I shrewdly suspect, he alludes to the presence of the accursed alcohol in

beans. If my suspicion prove correct, I shall have my bean-fields immediately ploughed up.

"Yours, in the great cause,
"J. WATERSPOUT."

The other letter is dated from "Abstinence House;" and contains the reason of the writer's absence from the meeting:—

"MY DEAR SIR,

"NOTHING less than a serious domestic calamity could keep me from the meeting of this day. The calamity is this. Ever since the appalling statements of our excellent chairman, at our last meeting, on the subject of 'spontaneous combustion,' I have been living in the hourly apprehension of witnessing such an event in my elderly and, generally speaking, amiable maiden sister, whom nothing can induce to give up her long established habit of a glass a day. But on my venturing, in the most delicate manner, to allude to the dreadful possibility, an explosion took place, of the *temper* I mean, which can be accounted for only by the presence in her system of large quantities of the gases of which alcohol is composed. However, determined to take every precaution, I have kept several vessels of water near me, night and day. Last night I was suddenly awoke by a shriek, proceeding, as I thought, from my sister's room; and, starting to my feet, I felt assured that I perceived a disagreeable scent of burning. Bursting open the door, I entered what appeared to me to be a room full of smoke, and continued to discharge vessel after vessel on my beloved sister, whose screams only confirmed my worst fears. Imagine my astonishment then at finding, when the vessels were emptied, and my strength exhausted, that no combustion had taken place, but that it had all originated in a fearful dream. The drenched condition of my poor sister required immediate attention; and on medical aid being obtained, she proved to be in circumstances of considerable danger.

"Yours, &c. devoted to Tee-totalism,
"Z. RAINY."

Several new members were enrolled, among whom the large family of the *Pumps*, all public characters, were conspicuous.

Valuable presents of books were laid on the table; among which we observed Pamphilus Herilachus *De Nat. Aquarum*: and Crato *De Abstinencia*.

The chairman then called on Dr. Sangrado to bring up the remainder of his report on alcohol. The former part, containing an account of the component parts of alcohol, the mode of performing the analysis, and the quantity of absolute alcohol in mixtures of alcohol and water of different densities, had been read at a preceding meeting. In conclusion, Dr. S. now demonstrated, to the consternation of many of the audience, first, the presence of alcohol in sugar;

secondly, the fact that alcohol has great affinity for, and readily mixes with water; thirdly, the extreme difficulty of separating them; and, fourthly, the power of alcohol to dissolve the resins, &c.; and added, that all bodies with which alcohol readily combined were now very properly called *alcoates*. He concluded with a prophecy that the time was not far distant when mankind would be divided into no other than the two great classes of *alcoates* and *anti-alcoates*. The prediction was received with loud applause.

On the adoption of this report, the chairman threw out several valuable remarks. It was, he said, a well-known fact, as Dr. S. had stated, that alcohol was capable of dissolving the strongest reason. (Here Dr. S. had to correct the amiable chairman, by stating, that his paper referred, not to the human reason, but to *resinous matter*.) The chairman, with that tact for turning every thing to account by which he is so much distinguished, assured the meeting that there was little or no difference between the two, and suggested a vote of condemnation against sugar. This was carried *nem. con.*

Dr. S. rose again to announce another important discovery—the presence of alcohol in bread; adding, that he had lately read of a baker in the old country actually publishing in his shop-window, “Bread sold here, with the gin in it.” This discovery of the demon in bread occasioned considerable demur; which ended by a proposition that the subject stand over till the next meeting.

After several able speeches, and much interesting conversation, the following subjects, allotted to various members, were announced for the ensuing meeting:—Mr. A. to report on the advantages of using the old *clepsydra*, or water-clocks; Mr. M. to report concerning the ancient sect of the *abstinents*, and the origin and meaning of the phrase *Bottle Imp*; and Dr. S. to communicate the result of his experiments as to the comparative strengths of different waters, and whether treble X water is not too powerful for ordinary use, and might not be advantageously diluted and reduced.

The next two meetings to be held on the 1st of April and St. Swithin's day.

DESIGN OF SACRIFICES.

It was the custom of the remotest antiquity for every individual to act as his own priest in sacrifices offered for himself. Cain and Abel offered each his own oblation. In sacrifices designed for the family, the father was entitled to officiate as its priest; a right which we observe Noah and Job respectively exercised. In succeeding times, when sacrifices were presented for communities consisting of various families, the prince of each community performed the public services. Thus Melchizedec was both a king and priest, and was invested with a priesthood such as never distinguished any but Christ himself.

After the departure of the Israelites from Egypt, the priesthood was separated from the sovereignty and transferred to Aaron and his posterity, by the express command of God, who performed all the functions peculiar to that office. “Them,” says Moses, “the Lord thy God hath chosen, to minister unto him, and to bless in the name of the Lord.”

Whatever opinion may be adopted respecting the origin of sacrifices, there can be no question of the fact, that they were appointed by God under the Mosaic dispensation. They were both numerous and specific, and it is therefore of great importance to ascertain their general design.

Some have considered the Hebrew ritual as an imitation of the forms and ceremonies practised in Egypt, a condescension to the prejudices contracted by the Israelites in that country. But this is improbable; for there is no one ceremony

or usage but may be proved to have been used by Abraham or Moses, or by some of the worshippers of the true God, earlier than by any of the heathen nations.

Without attempting to enumerate the various kinds of sacrifices, it may be affirmed in general that they were typical, and types of Christ; that is, they prefigured the fact of his personal sacrifice, and exhibited the nature and design of it. In the epistle to the Hebrews, the holy of holies in the tabernacle is compared with the highest heaven, and the high-priest of the Jews with Jesus Christ; and their sacrifices, especially those offered on the day of expiation, with the great sacrifice of Christ, as shadowing types with antitypes, as earthly things with those which are heavenly. Hence, some particular rites were appointed in relation to the principal victims, to represent some principal circumstances in the sacrifice of Christ.

A “type” is a symbol of something future; what is prefigured is the “antitype.” A type is prepared and designed by God to represent the antitype, which constitutes the distinction between a type and a simile. Many things are compared to others which were not made for the purpose of representing them. In comparing the two, the antitype supersedes the type, so that, whenever it comes, there is no longer any use for the type. The efficacy of the type is nothing more than the symbolical representative which it contained.

All the Jewish victims may be regarded as types of the sacrifice of Christ. The apostle Paul

tacitly compares all the different kinds of victims with the one sacrifice of Christ, as types with the antitype. "Wherefore, when he cometh into the world, he saith, Sacrifice and offering thou wouldst not, but a body hast thou prepared me; in burnt-offerings and sacrifices for sin thou hast had no pleasure. Then said I, Lo, I come (in the volume of the book it is written of me,) to do thy will, O God. Above when he said, Sacrifice and offering and burnt-offerings and offering for sin thou wouldst not, neither hadst pleasure therein; which are offered by the law; then said he, Lo, I come to do thy will, O God. He taketh away the first, that he may establish the second. By the which will we are sanctified through the offering of the body of Jesus Christ once for all." Heb. x. 5—10. No reasonable doubt can be entertained that those victims, whose carcasses were to be burnt without the camp, were types of Christ, and that in a more eminent degree than the rest. For, besides their unblemished perfection, in which they prefigured Christ in common with the rest, all these victims were piacular, as was his sacrifice. And they the more eminently typified his sacrifice by the very circumstance of their being commanded to be burnt without the camp. "The bodies of those beasts whose blood is brought into the sanctuary by the high-priest for sin, are burned without the camp. Wherefore Jesus also, that he might sanctify the people with his own blood, suffered without the camp." There would be no force in the argument respecting the place where it was requisite Christ should suffer death, unless all the victims whose blood was to be carried into the sanctuary had typified his sacrifice.

Our Lord himself taught that the sacrifices of the Jews were typical or prefigurative of his sufferings. "These are the words which I spake unto you, while I was yet with you, that all things must be fulfilled, which were written in the law of Moses, and in the prophets, and in the psalms, concerning me. Then opened he their understanding, that they might understand the Scriptures, and said unto them, Thus it is written, and thus it behoved Christ to suffer, and to rise from the dead the third day." Luke xxiv. 44—46. If the sacrifices of the law were typical, this reference to the law of Moses, as evidence for the necessity of his sufferings, was appropriate and forcible; if not, it was wholly irrelevant.

The Jewish sacrifices were also vicarious, as well as typical; and typical more especially in this respect. Vicarious punishment is an evil inflicted on one being to expiate the guilt of another, with a view to save the transgressor himself from punishment. The punishment inflicted on the substitute may either be of the same kind, or different from that which the offender merited. It is common with the sacred writers to speak of sin as a defilement, and hence to expiate is to purify. On the solemn day of

atonement, the Hebrews, in obedience to the Divine command, transferred the sins of the people, in a symbolical representation, to the goat that was to be led away into the wilderness; and the animal itself was considered as communicating defilement to the person who led him away. The rite consisted in the imposition of the high-priest's hands, as representative of the people, upon the head of the goat, accompanied with confession of sins. The same rites and the same efficacy belonged to the victims whose blood was carried into the sanctuary, and whose bodies were carried without the camp. There could not be a more evident instance of vicarious punishment than for the sins of the offerers first to be transferred, by a symbolical rite, to the victims about to be slain, and then to be immediately expiated by the blood of those victims to which they had been transferred. And the law declared "it is the blood that maketh an atonement for the soul." We must observe also, that the blood was not only shed, but "presented to God." It was thus signified that the life of the victim was surrendered to God as the price of expiation, and to obtain favour for the transgressor; and hence we see on what principle vicarious punishment was sustained by Christ, "who gave his life," as it is declared, "a ransom for us."

It has been said that the transference of sins could never be real, but only figurative. True; but the figure had a meaning, which was, that the victims were substituted for the offenders, and expiated the sins for which they were sacrificed.

The right by which punishment for sin is inflicted on a substitute, rests either on the sovereignty of the party who punishes, or the consent of him who is punished, united with sovereignty. The former was the case in the Jewish sacrifices, the latter in that of Christ. The law may be satisfied either by an offender suffering the punishment of his own sin, or by a substitute who sustains the punishment of another's sin. The substitute suffers not the precise penalty of the law, which can be inflicted only on the offender himself, but a punishment which secures the same end—the restoration and preservation of the authority of the violated law. The efficacy of personal suffering must arise from its being equivalent to the crime; but that of a vicarious kind, from the acceptance of the substitution on the part of God, and from the willingness, purity, dignity, and merit of the substitute.

All these considerations are applicable to the sacrifice of Christ, which therefore the Jewish sacrifices prefigured. He sustained the character of a real high-priest; and in that character offered up himself as a real sacrifice. The apostle runs an exact parallel in proof of his priesthood between him and the Jewish priests, in being taken from among their brethren, in the appointment to other gifts and sacrifices, in being subject to

infirmity and suffering, and other points. And, then, with regard to the offering itself, without a sacrifice there could not be a priest; and what was the sacrifice? "Who needeth not daily, as those high-priests, to offer up sacrifice, first for his own sins, and then for the people's: for this he did once, when he offered up himself." Every part of our Saviour's proceedings with regard to his sufferings show they were voluntary; and his very words, "for their sakes I sanctify myself," is equivalent to saying, "I offer myself to be slain as a piacular victim." Having been sacrificed on the cross, he ascended to heaven, and entered the holy of holies as our High-priest, as well as the Lamb slain; precisely as the high-priest of the Jews carried the blood of the victims into the innermost sanctuary of the temple, as a sign of their precious sacrifice, and sprinkled it towards the mercy-seat.

The whole argument of the apostle, in the book of the Hebrews, proceeds on an "assumed similarity and correspondence in the nature and objects of the Jewish priesthood and that of Christ." Now it has been shown that the Jewish sacrifices were a necessary consideration of forgiveness, and a means of obtaining it. It follows, therefore, that as the death of Christ is spoken of in language applied to the Jewish sacrifices, it is the great consideration for the forgiveness of sin, and the long-predicted and perfectly and only efficacious means of obtaining it. In conformity with these views, a few out of numerous passages of holy writ may be cited, which, if they do not proclaim a real atonement for sin, can have no meaning whatever, and must necessarily mislead us. It might also be remarked, that if the Jewish sacrifices were not typical, they were manifestly absurd, and there was the pomp of ceremony without the reality of worship. "He was numbered with the transgressors, and he bare the sin of many." "The Lord hath laid on him the iniquity of us all." "He was wounded for our transgressions, he was bruised for our iniquities, the chastisement of our peace was upon him, and by his stripes we are healed." "Thou shalt make his soul an offering for sin." "Messiah shall be cut off, but not for himself." "The Son of man came to give his life a ransom for many." "For this is my blood of the New Testament,

which is shed for many, for the remission of sins." "Behold the Lamb of God, that taketh away the sins of the world." "Whom God hath set forth to be a propitiation through faith in his blood, to declare his righteousness for the remission of sins that are past." "When we were without strength, in due time Christ died for the ungodly." "Even Christ our passover was sacrificed for us." "Who gave himself for our sins." "Now once in the end of the world hath he put away sin by the sacrifice of himself." "Who his own self bare our sins in his own body on the tree." "Thou wast slain, and hast redeemed us to God by thy blood."

Some theologians represent our Lord as an example and martyr only. It is not denied that he was both, but he was more—he was a sacrifice for sin. Do the passages quoted represent him as an example and martyr only, or chiefly? Obviously not. They ascribe merit to his blood—efficacy to his death—and a redeeming power to his self-immolation. They connect the fact of his death with the typical sacrifices of the Jews and the remission of sin. What absurdity would there be in the frequent and fervent appeals of apostles, and how dissimilar to all they declare respecting others, if he be viewed as a martyr only! What can they in this case mean by "coming to him," "believing on him," "trusting in him," "committing thy soul to him," and other similar expressions? What can be meant by curses denounced upon those who do not come to him—by the assurance that "he that believeth hath life," and the contrary? How would this sound with reference to Paul, Peter, John, or Stephen? It is needless to urge the inquiry. Such an application of terms would be manifestly an abuse of language—a trial of credulity, and a falsification of Scripture. If Christ were not a sacrifice, he was not a Saviour, and ye are yet in your sins. Then there is no hope on earth—no redemption from the grave—no pardon for sin—no peace with God—no blessedness in heaven! Then had the Jewish economy no meaning, and the Christian no truth. Then is the Bible a book of history or morals; we have no better religion than the wisdom of men has devised; and he who rejects the Cross may, if he pleases, receive the crescent.

X.

GEMS, AND GEM ENGRAVING.

GEMS.—These minor sculptures of antiquity form, in many of the museums and collections of the learned and the wise, very beautiful and perfect specimens of what the French so poetically term the *bijouterie* of sculpture. Many an antique gem is the key to a store of mythological or historical illustration, or the first link of a chain of poetical associations, and, as such, is gazed on, and read, and felt, by the man of classical

taste, in a manner of which none but he can form an adequate conception. It may be the portrait of a Pericles, an Aristides, a Leonidas, a Cato, a Cicero; or it may elucidate an Eleusis, a Marathon, or a Pharsalia; or it may, in the lineaments of a Sappho or a Pindar, wake in the imagination a beautiful paradise of music and imagery, and, like the magic touches of the masters of song, spread before us a feast of rapturous and illusive

enchantment. This may be elucidated by two references, equally beautiful and often quoted; the one where Shakspeare brings "the sweet south" to "breathe upon the bank of violets;" the other where the divine and glorious Milton, that minstrel of the lost Paradise, speaks of those who sail

"Beyond the Cape of Hope —
Sabeen odours, from the spicy shore
Of Araby the blessed."

Such quotations as these, and numerous others which could be named, diffuse a beautiful imagery over our household words and thoughts, and shed the glorious calm of starry dreams over the solitude of our midnight slumbers.

The importance of sculptured gems to the investigation of some of the mystic histories of a renowned antiquity; to the artist and amateur, as assisting further in the development of the same; and to the cultivation of that natural and elevating indulgence which, in the solemn and overshadowing hours of reverential thought, we feel when gazing on the features of the mighty and departed dead, is sufficient at once to proclaim them as objects of delightful and attentive study. Gems illustrate the mystic attributes and tales of mythology, the costumes of antiquity, the delightful romances and fictions of the poets, the characteristics of the earlier tongues and languages of the ancient nations, the great eras of historic actions and events, and the early origin, progress, and increased perfection of the fine arts in the remote and shadowy ages of the past. In support of these assertions, it will be sufficient to refer to the circumstance, that the full countenances and linear profiles of Virgil and Mæcenas, of Cicero and Alexander, are known to us but by the impressions we have received of them from sculptured gems. Again, the Venus of Praxiteles, the head of the Phidian Minerva, the Apoxyomenos of Polyclethus, those glories and triumphs of the ancient art of statuary, are to be found in our day only minutely and faintly shadowed forth in miniature resemblance upon gems; and the restorations of the Venus de Medici and the Laocoon have been made only and entirely from gems. They offer to the reflecting mind a vast and endless treasure of the brilliant thoughts and buried wisdom, the forgotten skill and the vanished beauty of a past era and epoch, when the mind and the form of man had, in the days of the venerable and antique philosophy of Greece and Rome, reached the nearest summit on the Parnassian hill of perfection.

But if we extend the range of our inquiries still further into this singular and delightful branch of art, we shall find that the first use to which the discovery of gem-engraving was applied was to the sculpture of signets, and that this came from the common fountain-source and origin of all the fine arts—India. Signets of lapis-lazuli and emerald, bearing Sanscrit and other verna-

cular inscriptions of that land, have been found, bearing evidence of an olden antiquity beyond all ages of record. From India the natural transmitted stream of the fine arts was to Egypt; and the national museums and collections in England, as well as those of private individuals, artists, and amateurs, abound with cameos and intaglios bearing hieroglyphic inscriptions, figures of Isis, Osiris, the lotus, and the crocodile, together with the entire and endless array of symbolic Egyptian mythology, wrought upon jaspers, emeralds, basalts, blood-stones, and turquoises. Even at this early period of the historic eras of mankind, it will be thus seen that the mechanical skill of sculpture and engraving attained a very high degree of excellence and perfection. In the times of the ancient Israelites, we find this same skill in the fine arts in full exercise. The stones composing the breastplate of the high-priest of the Jews were each engraved with the name and title of one of the twelve tribes of the land, and of those stones one was a diamond.

The Etruscans, that remote and fragmentary nation, of whose existence but little is known to us, save but from the classic and beautiful fragments of their arts,—but who, on the faith of those fragments, must take a high and glorious rank amongst the polished and classical nations of the olden world,—have enriched and beautified many of our national collections with gems of a peculiar compound style of sculpture. Their general shape is somewhat similar, in its outline and appearance, to the Egyptian, that of the scarabeus more particularly; and even in those gems where the shape and style vary, the scarabeus is frequently found engraven. The subjects which they represent are chiefly Greek, but of the more antique history of that land,—the war of the chieftains at Thebes, Peleus devoting his hair, Tydeus after bathing, Theseus imprisoned by Pluto, Perseus with Medusa's head, Capaneus struck by lightning before Thebes, and Hercules bearing the tripod; these, and others which embody the early mythological histories of the Grecian deities, have been among the finest sculptures on the Etruscan gems. From this nation we find that the art of gem-engraving passed to the Greeks, who cherished and cultivated it among the arts which they had made their own; and in a short time, by their energy and perseverance, brought it to its highest summit of perfection. In due process of time the genius of the Greeks, which has left to us the remnants and fragments of so many wonders in the larger sculpture, became displayed with scarcely less power and beauty in those more minute and miniature works of art. So truly has this been proved, that it may be asserted as an axiom in the artistical history of Greece, that had the fame of the statues of Greece perished, the fame of her arts might have been as well and as nobly sustained by the exquisite beauty and

sculpture of her gems. The era of that school whose followers more particularly excelled in the art of gem-engraving may be divided into three separate and distinct periods. From the time of Theodorus the Samian, who was the sculptor of the celebrated emerald Polycrates, to the period including the reign and victories of Alexander the Great, may be considered the first period; from the reign of Alexander to that of Augustus, the second; and from the time of Augustus to the fall of the empire may be considered the third and last period.

The characteristics which particularly distinguish the Greek gems, are those of delicate grace and stern vigour; the auxiliaries and adornments are composed in a fine classical spirit; the emblems and attributes exhibit a care and accuracy of delineation and composition, which implies an extraordinary degree of historical and mythological information in the class of artists to whom the delicate workmanship of these sculptures was intrusted, and who may be considered to have been but as slaves during the long period of years in which the art which they possessed was known and practised. The Greek gems generally exhibit the figure nude; the Roman gems displayed the figure draped; the former were chiefly intaglios, and exhibited the finest workmanship; and where cameos were produced they were generally inferior in form, delineation, and sculpture.

The great number of these gems, which were sculptured whilst the art was in the rich freshness of its youth and glory, compared with the actual small number which have come down to us in modern times, cannot but afford the melancholy proof that a vast number of these beautiful works of art must have perished; but with this sorrowing reflection we may mingle the happy reminiscence that many of these gems have reached us, whose delicate beauty and superiority of design and sculpture make the glory of the cabinets in which they are enshrined. Of this character are—

The Alexander and Olympias, a cameo in the Vatican, which was formerly in the Odescalchi collection, and is a work of remarkable size and beauty.

Bacchus and Ariadne in a chariot drawn by centaurs, the apotheosis of Germanicus, Agrippina and Germanicus, Ulysses, Tiberius, Hadrian, Antinöus; all in the royal collection at Paris.

The apotheosis of Augustus, in two lines of figures, with Livia as Rome, and her family, with Neptune and Cybele in the background; in the imperial collection at Vienna.

The magnificent cameo sculptured on a sardonx, and which has given origin to much learned dispute among the Tristans and Montfaucons, but which is now considered to represent the apotheosis of Augustus and his family. On the upper line, and at the summit of the

gem, are represented the emperor and the princes of the house of Tiberius seated among the gods. On the second line, and more in the centre of the gem, is represented Germanicus, with Agrippina and Caligula beside him. On the lowest line, at the lower border of the gem, are represented the captives.

The intaglios which have been handed down to us are still more numerous than the cameos, and of a more remote period of antiquity and excellence of detail and design. Many and various have been the keen and classical disquisitions indulged in and written upon with reference to the design and intent which some of these are intended to represent. As an example of this, we may mention the beautiful gem Cornelia, which is supposed to have been Michael Angelo's seal, and is now in the cabinets of the Parisian collection. In this some have recognised a sacrifice in memory of the birth of Bacchus, the birth of Alexander, or the festival of Panathenæa. Others, again, have supposed it to represent the Paanepsia; Alexander in the character of the Indian Bacchus, or a copy of figures in the *plafond* of the Capella Sistina, at Rome; or, lastly, the representation of a simple village *festa*; which latter has been considered, and with much truth, to be the most probable conjecture. The industry of Pliny has collected a list of the most celebrated Greek engravers; and the additional names and notices which have been collected are but few and obscure. Among both of these we may enumerate—

Pyrgoteles—the only engraver to whom Alexander would intrust his portrait on gems—the heads of Alexander and Phocion.

Tryphon—the marriage of Cupid and Psyche.

Chronius—Terpsichore standing.

Admon—Hercules drinking.

Cænus—Adonis, a Faun celebrating the bacchanalia.

Cneius—the stealing of the palladium, a young Hercules, a Cleopatra of singular beauty, a Theseus wearing the spoils of the bull of Marathon.

Dioscorides—the most eminent engraver of the reign of Augustus—a Mercury with the petasus, the caduceus, and the cloak; a Diomedes with the palladium; an Io, an incomparable gem; a head of Demosthenes, two busts of Augustus, a Perseus gazing on Medusa's head.

Epitychanus—A Bellerophon mounted on Pegasus, a rich cornelian, in the possession of the chevalier d'Azard; a head of Sextus Pompey.

Evodus—an aqua-marine, on which is sculptured a portrait of Julia, the daughter of Titus and Marcia. This work is a most admirable one for the elegance of the design and the skill and delicacy of the workmanship.

These artists and their works constitute but a small proportion of the names or productions of the great engravers of Greece. From that favoured land it may be traced to the sunny cli-

mate of Italy, where it was cherished and supported, though with less aptitude and skill, by those who professed it, than had been evinced by the artists of that land where it had risen to its highest pitch of pristine excellence.

When the last ruin of the Roman empire fell, the art of engraving upon gems sank into comparative lowness and insignificance, and was but feebly cultivated and sustained during the savage darkness and tumult of those ages, which have ever been denominated "barbaric." During the reign of the Medici, literature and the fine arts underwent a general revival; and during the years of the fifteenth, sixteenth, and seventeenth centuries, the most celebrated engravers on gems were found among the Italians. Next to Italy, Germany held the next rank; and Kilian, (who, from his skill in the art, was named the German Pyrgoteles,) Pickler, and Natter, were among the ablest and the most famed of modern artists.

In France, the fondness and, we had almost said, the exclusive taste of the nation for works of art on a vast and extended scale, to strike the popular eye, hastened most materially to turn off and withdraw the attention of the artists from the finer skill and minuter beauty of gem-engraving and sculpture. There are but few French artists of repute; and the science and skill required for the higher perfection of gem-engraving seem to have nearly perished, or dropped into comparative oblivion.

In the museums and cabinets of both public and private collections, the skill and science of English artists have ever held a deservedly high and favoured rank; and the names of Simon, Reisen, Brown, and Marchant, may be named

amongst those who have sculptured many gems of remarkable taste, spirit, and learning.

The principal collections, cabinets, and museums of gems are to be found in foreign cities. Previous to the last invasion of the French, the principal ones in Italy were the Florentine, founded by Lorenzo de Medici; the Strozzi, the Ludovisi, the Azara, and that in the Vatican. Besides these may be enumerated the St. Petersburg, the Prussian, the Danish, the Orange, and the Vienna collections. In the British Museum is a fine collection of valuable gems, which deserve to be more publicly known than they are. The principal private collections in England are those of the noble families of Devonshire, Marlborough, Bedford, and Carlisle.

We cannot conclude this article without remarking, that although the finer and richer class and order of gems may be seldom within the means of private purchasers, yet that the art of making pastes or coloured stones places all that constitutes the true value of the original gem—its story and its beauty—entirely within the most moderate expenditure. In Italy sulphur and wax impressions from the most famous gems are frequently to be met with; but we believe that the best imitations of the antique are to be met with in the pastes executed by Mr. Tassie, of Leicester-square. Among these the delicate sculpture and fine tint of the gem are executed and copied with a most praiseworthy and extraordinary fidelity. This collection of Mr. Tassie's, which may be considered as the most complete in Europe, amounts, we believe, to upwards of fifteen thousand, and comprises the finest facsimile copies of the most wonderful and celebrated gems known.

EPHON.

PEN AND INK SKETCHES.—No. I.

MISTER LOFTY.

It is our intention to prepare, for the amusement and edification of our readers, a series of pen and ink sketches of some of our and their dear friends. Many have already sat, others are now sitting to us; and others, again, only wait their turn. Among the portraits now in progress are those of Mistresses Kind, Smooth, Fussy, Snake, Meddle, and Soft; Misses Double, Finical, and Precise; Messieurs Sanguine, Gossip, Busy, Subtle, Purseproud, and Snap. The first which we are enabled to hang, in what we hope will hereafter be a very respectable gallery, is that of Mr. Lofty.

Lofty is a great man—a very great man. There have been many great men since the creation. Horace informs us that brave men were living before Agamemnon, and doubtless many great ones were also living in that remote period. We have since had Homer, Hesiod,

Pindar, Euripides, Xenophon, Plato, Demosthenes, Euclid, Terence, Cæsar, Cicero, Virgil, Horace, Livy, Tacitus, Plutarch, Alfred, Dante, Hannibal, Alexander, Shakspeare, Bacon, Milton, Cromwell, Dryden, Pope, Wren, Marlborough, Locke, Frederick, Peter of Russia, Charles XII., Addison, Newton, Raffaële, Michael Angelo, Salvator Rosa, Claude, Cervantes, Racine, Corneille, La Place, Handel, Mozart, Burke, Fox, Pitt, Sheridan, Washington, Watt, Canova, Napoleon, Goëthe, Scott, Byron, Canning, Coleridge, Wellington, Wilkie, Chantrey, Wordsworth, Majendie, Brougham, Moore, and a host besides, both ancient and modern, too numerous to mention.

These were, or are, all great men; yet Lofty, in his greatness, resembles none of these: he is not a great statesman, warrior, poet, painter, architect, orator, chemist, sculptor, mathematician,

surgeon, or philosopher; but he is a *great* lover and admirer of himself. A deceased statesman proved that it is possible for a man to turn his back on himself. It must, therefore, be possible for him to behold himself through a glass. This Lofty does, taking care to use a magnifier of first-rate power, and when he has occasion to look upon his fellows, he inverts the telescope, and thus deludes himself into a feeling similar to that which Gulliver must have experienced while residing among the Lilliputians. An artist having occasion to illustrate the singular production of St. Patrick's eccentric Dean, above alluded to, could not do better than take a full-length of Mr. Lofty. The air, carriage, every thing required, he would be in immediate possession of, without the slightest exercise of imagination, if indeed he should happen to possess a faculty so rare. Yes, in Lofty he would find a Gulliver ready made, for he ever walks as if there was danger at every step of his crushing a hundred or so of the subjects of his majesty of Lilliput beneath the sole of his boot.

Lofty's notions are ludicrously aristocratical, as far as his station in life is concerned. Had he been a peer, he would have been one of the most pertinacious sticklers for the privileges of his *order*, unless indeed the superior degree of enlightenment and more enlarged view of society which such rank supposes, should have prevented his imbibing the vulgar and narrow feeling which now influences him. He pretends not to the distinction of birth: indeed, the fact of the existence of his father is only presumptive, yet he is a man of fashion, for he pays and receives morning visits; he moves in a circle of gentility, for he receives and attends tea-parties; his station is exalted, for he is member of a profession; he is eminent in learning, for he proceeded in the Latin grammar beyond *hic, hæc, hoc*; and we believe, though we cannot vouch for the fact, knows nearly the whole of the Greek alphabet. He has a knowledge of the fine arts, for he pays an annual visit to Somerset-house;—of science, for he peruses the *Mechanics' Magazine*. He is decidedly literary, for he seldom omits to turn over the pages of the *Literary Gazette* and the *Athenæum*; and altogether, as we trust we have made sufficiently apparent, he is a very exalted and consequential personage.

Lofty's associates are mostly men possessed more or less of that species of greatness by which he is so distinguished; and although he perceives among them no equal, he yet permits the approaches of a chosen few, and extends to them the peculiar privilege of basking occasionally in

the beams of his genius—of now and then drawing life and light from a luminary so resplendent.

Lofty, as may be supposed, is in the habit of speaking in a depreciating strain of most of the inferior individuals moving around him. But the wonder is—and the fact says much for his disposition, which we believe to be naturally amiable—that he does not do this to a greater extent considering his fixed belief in the magnitude of his own importance, and the diminutiveness of that of others. It will sometimes happen that some one of his acquaintance is not disposed to acknowledge the gulf fixed between him and his traducer to be quite so wide as the latter supposes. He is presumptuous enough to require an explanation of something which Lofty has said; then the character of the latter shines forth in all its glory and grandeur.

Lofty will not, of course, condescend to acknowledge that he did, or assert that he did not, say the thing complained of. He will not demean himself by giving a direct explanation of any kind; but, to preserve his dignity, he dodges right and dodges left of the question, like a full-dressed courtier returning from a drawing-room, who sees in the crowd a sweep already nearly in contact with him; and as the aforesaid courtier may, in his endeavours to avoid actual contact with his sooty neighbour, put his leg knee-deep in the kennel, so Lofty sometimes comes out of these affairs bedaubed to an extent which would be very prejudicial to self-complacency less invulnerable than his. Extremes meet; pride and meanness are twin-brothers. So Lofty, in endeavouring to retain his supposed altitude, descends to a level which would never be reached by an individual less exalted in his own estimation.

Yet, after all, even in his sinuosities Lofty is the great man: if he deviates from the direct course, it is not with the gentle, moderate curvature of the earth-worm. No, his twistings and twinings are all on a large scale, like those of the *boa constrictor*. Great he aims to be in all situations; therefore, when he shuffles, he is a *great* shuffler. We are not without hope that time and a few lessons, unpalatable it may be, yet extremely salutary, may modify Lofty's character, and reduce him to the natural dimensions of man; a result much to be desired, for, in proportion as he becomes less *great*, he will undoubtedly become more respectable.

Reader, if you wish to discover Lofty, do not trouble yourself to look in the "*Court Guide*," he is to be met with in most of the *genteel* streets of London.

COLERIDGE AND PLAGIARISM.

MR. COLERIDGE has often been charged with plagiarism, whether justly or not we do not now mean to decide; perhaps the following statement may be mistaken by some for a confirmation of the charge.

The following lines of Coleridge's were published in the complete edition of his poetical works, by Pickering, without any allusion to a similar poem by any other writer;

STROPHE.

Unperishing youth !
Thou leapest from forth
The cell of thy hidden nativity.
Never mortal saw
The cradle of the strong one ;
Never mortal heard
The gathering of his voices,—
The deep-murmured chorus of the son of the rock,
That is lisp'd evermore at his slumberless fountain.
There's a cloud at the portal, a spray-woven veil
At the shrine of his ceaseless renewing ;
It embosoms the roses of dawn,
It entangles the shafts of the moon,
And into the bed of its stillness
The moonshine sinks down as in slumber,
That the son of the rock, that the nursing of heaven
May be born in a holy twilight !

ANTISTROPHE.

The wild goat in awe
Looks up, and beholds
Above thee the cliff inaccessible.
Thou, at once full-born,
Madd'nest in thy joyance,
Whirlest, shatter'st, splitt'st,
Life invulnerable.

The following is a literal translation of a German poem by Count Friedrich Leopold von Stolberg :—

Unperishing youth !
Thou streamest from forth
The cliff of the rock.
Never mortal saw
The cradle of the strong one ;
Never mortal heard
The lisp'ing of the noble one in the bubbling well.

How beautiful thou art
In silvery locks !
How terrible thou art
With the thunder of the echoing rocks around !
Before thee trembles the fir ;
Thou hurlest the fir,
Both root and branch.
The rocks implore thee ;
Thou seizest the rocks,
And spurning rollest them like pebbles away !
The sun clothes thee
In the beams of his glory ;
He paints, with the hues of the rainbow,
The waving clouds of the scattering flood.

Why hastenest thou so
To the green, green sea ?
Art not pleased so near to heaven ?
Not pleased in the echoing rocks ?
Not pleased in the hanging oak-bush ?

O, hasten not so
To the green, green sea !
Youth ! still thou'rt strong as a god,
Free as a god.

True, the tranquil calm smiles on thee beneath,
The rolling motion of the silent sea,
Now silver'd by the floating moon,
Now golden and red in the western beam.
O, youth ! what is the silken calm,
What the smiling of the friendly moon,
The purple and gold of the evening sun,
To him who feels himself in the bonds of slavery ?
Still streamest thou wild,
As thy heart doth bid !
Yonder, beneath rule of changing winds,
Of the stillness of death, in the servile sea !

O, hasten not so
To the green, green sea !
Youth ! still thou art strong as a god,
Free as a god !

It would have been no disparagement to Mr. Coleridge if he had mentioned that such a piece had been written by Stolberg; and if he had called his own an imitation from Stolberg, it would not have been more than was due to the German poet. The German has great merit, perhaps as much in that language as Coleridge has in English. Coleridge's poem was cited, in No. CI. of the "Quarterly Review," ("Review of Translations of Pindar,") as a rare specimen of rhythm without rhyme; and justly so. Perhaps there is no instance in the whole compass of English poetry in which words, metre, and cadence are so admirably adapted to express the sense intended to be conveyed. The wild, ebullient sportiveness of the gushing cataract could hardly have been transferred to paper more faithfully than it is here. Certainly, it was written under the inspiration of Stolberg; but, notwithstanding this, it is, in most respects, original,—the melody is original, and the latter part is original in words, ideas, and every thing else. With Stolberg's lines before him, probably no writer but Coleridge could have produced so perfect a poem. No other poet with whom we are acquainted, in any language, appears to have possessed so delicate a sense of harmonious combinations, so elastic a susceptibility to the impulses of the melodious, or so unerring an instinct in detecting and perpetuating the just balance: *instinct*, we call it, though, in reality, the power to which we allude, if primarily a gift of nature, is only brought to the perfection we speak of in its wider application, by close and minute attention, and a continued observation of the phenomena of sound.

Coleridge has imitated, and acknowledged the imitation of, another poem of Stolberg,—*"Tell's Birth-place."* This is almost a translation.

FUNERAL CEREMONY AT TAVOY.

BY THE REV. H. MALCOM, A. M.

DURING my stay at Tavoy were performed the funeral-rites of a very distinguished pongee, or priest; it is a rare occurrence, of course, and attracted the attention of almost the entire populace. He had been dead several months, and was preserved, embalmed, and cased in wax, till now, when the ceremony of burning was to be performed. The body had been covered with wax, after extracting its juices and applying the usual preservatives, and was lying in state under a highly ornamented canopy. The face and feet, where the natural shape had been restored by the coating of wax, were visible and completely gilded. Five or six cars on low wheels, very magnificent in Burman eyes, had been prepared, to which were attached long ropes, to some of them at each end; they were constructed chiefly of cane or bamboo, and were, in their general construction, in pretty good taste, and quite costly withal, in gold leaf, worked muslin, &c. When the set day arrived, the body and its decorated coffin was removed, amid an immense concourse, from its place under the canopy to one of these cars, with an excessive din of drums, gongs, cymbals, trumpets, &c. When it was properly adjusted in its new location, a number of men mounted the car at each end, and hundreds of people grasped the ropes, to draw it to the place of burning, half a mile distant. But it had not advanced many paces before those behind drew it back. The air was rent with the shouting of each party to encourage their men. The other cars of the procession were dragged to and fro in the same manner. The pretence of the one party was a devout desire to accomplish the funeral-rites; and that of the other, an affectionate reluctance to part with the remains. Some two or three old women at the ropes looked grave; all the others were laughing and making sport of the operation. I came away, at length, leaving them contending still.

For several days the populace amused themselves with dragging the cars backward and forward which I did not care to see; but at length, being informed by the governor that at three o'clock to-day the burning would take place, I repaired to the spot, and found the advancing party had, of course, succeeded; and all the cars were in an open field, where was the place of burning, enclosed by a light fence. A great concourse filled the area, dressed, as before, in their best clothes, and full of festivity; not a beggar or ill-dressed person was to be seen. Almost every person, of both sexes, was dressed in silk; and many, especially children, had ornaments of gold or silver in their ears and round their ankles and wrists. Not an instance of

drunkenness or quarrelling came under my eye, either now or on the preceding day.

Within the enclosure was a car, on which was a pyramid, open on all sides, like the others. The height was about forty feet. At an elevation of sixteen or eighteen feet it contained a sort of sepulchral monument, like the square tombs in our churchyards, highly ornamented with Chinese paper, bits of looking-glass arranged like flowers, and various mythological figures, and filled with combustibles. Over this the car was formed into a canopy, with a long spire, all decorated to the utmost with tinsel, festooned embroidery, wreaths of flowers, &c. The body, in its gorgeous sarcophagus, being removed from the car on which it was brought, and placed on the monument, a procession of priests was seen approaching, who took their seats within the enclosure, at one end, on a raised platform, while in another direction came an artificial tree, called "the tree of life," borne on the shoulders of men, who reverently placed it between the priests and the pyramid or funeral pile. Women also came, bringing on their heads baskets of fruit and other articles. The tree was ingeniously constructed of fruits, rice, boxes, cups, umbrellas, staves, raiment, cooking-utensils, and, in short, an assortment of all the articles deemed useful and convenient in Burman housekeeping. These and the other offerings, I was told by a bystander, were for the use of the deceased. They were, however, taken to the neighbouring monastery, and, of course, applied to grosser uses.

The priests, confronted by a small audience of elderly persons, having mumbled over one or two short prayers, and performed some absurd ceremonies, retired. Then commenced an exhibition of fireworks, at a little distance, a parade of which Burmans are very fond, and in some parts of which, especially the rockets, they certainly excel. Cords from the place of exhibition were attached to the funeral-car or pyramid, along which ran horizontal rockets, bearing various figures, which dashed into the pyramid, demolishing, each time, some portion of it, till at length, more combustibles being thrown into the car, it began to blaze, and in half an hour was totally consumed. A few other fireworks concluded the ceremony, and the people quietly dispersed.

Nothing could be further from solemnity than the whole proceedings. Not the least effort was made by the priests to instruct the multitude; but after their part of the pageantry was performed, they instantly mixed with the people, gazing and laughing like boys. The principal feeling manifested before white persons was pride at the glory of the occasion. This seemed very

apparent: they were evidently pleased to see Europeans there; and as I was standing with some of these, a principal chief came up with his retinue, and, from a long-necked vessel with a perforated stopper, sprinkled us profusely with rose-water, making a salaam very politely. The occasion was just a festival, and carried forward

with the same feelings that they get up any other spectacle. I longed to be able to enter into conversation with some of the many who sat quietly looking from an adjacent grove, but was obliged to content myself with humble prayer that this great people might be soon turned from idols. O that the day may soon come!

THE ALBUM.

AN Album once went far astray
From house to house, from day to day,
In search of writers able:
At length, its weary journeys done,
It stretched itself at ease upon
Dear Madam's spider table.

And Madam now with beaming look
Hastes to explore her favourite book,
And con her new-made treasure;
But see the smiles forsake her brow,
And every feature darkens now
To sadness and displeasure!

The book was sent to careful hands,
With oft repeated, strict commands,
To shun all *vulgar* dealing;
But here are names which no one knows,
And rhymes far worse than sorry prose—
Her friend could have no feeling!

Full sure there is among the score
A Walter Scott, and Thomas Moore,
But nought besides their *name*.

While blockheads with their scrawl abound,
As if they ne'er before had found
An open door to fame!

But chiefly this perplexed her mind—
That good and ill were so combined
Beyond her power to sever;—
Had it been evil altogether
Her heart had lightened to a feather,
Her book destroyed for ever!

Or, had the good surpassed the ill,
The bad might be forgiven still,
Since nought can reach perfection;
But thus it was—Oh wretched fate!—
The book she could not love nor hate,
Though *pet* of her affection.

Then, lady, whosoe'er you be,
When you shall scan this history,
Just make this memorandum;
That whosoe'er you love beside,
You ponder well ere you decide
To idolize an *Album*.

CALAMUS.

REVIEW.

Nature considered as a Revelation. By the Rev. ROBERT BAYLEY, F. S. A. London: Hamilton, Adams, and Co. pp. 250.

ALL theology is revealed, the natural as well as the verbal: hence the propriety of Coleridge's remark, that the phrase "revealed religion" is a pleonasm. There can be no religion but revealed; the only distinction lies in the mode of the revelation. Mind itself is a revelation: "Let us make man," said the Triune God, "in our own image;" that is, "to reflect our likeness." Mind, then, is not merely the instrument by which a revelation is received and appreciated, but constitutes, *per se*, a divine revelation,—the first intimation, to man, of a Primitive and Supreme Mind. The sun, in the very act of causing its own reflection, reveals itself to all intelligent beings; and God, in the very act of reflecting his Divine image in man, discovers himself.

In the same sense "the heavens declare the glory of God, and the firmament sheweth his handiwork." The expanded volume of nature is inscribed and illuminated by the same finger which wrote the law on Sinai; it is instinct with lessons of morality, and full of the rudiments of art and science, an encyclopædia of wisdom. But the fall of man has rendered the addition of another volume indispensable. By sin he brought himself into a new situation, in which all his previous knowledge was only calculated to fill him with alarm. New knowledge must be imparted; for how does he know what a holy God may see fit to do with him, a transgressor? A revelation adapted to

fallen man, while it includes and authenticates the great principles of natural religion, must also provide for the expiation of his guilt, for the renovation of his nature, and his restoration to God.

Now, while Mr. Bayley, in the interesting and original volume before us, is perfectly orthodox on these points, and freely admits that, even within its own circumscribed and peculiar limits, many of the readings of the book of nature are conjectural and obscure, he contends that it is almost universally disparaged, and allowed to become comparatively a sealed book; and proposes to vindicate its lofty claims to occupy and adorn the chair of wisdom.

We have called his work original: we are aware, indeed, that many, especially of our elder writers, have thrown out hints of the idea which pervades it: we remember *Aim* who was called "the Priest and Interpreter of Nature;" we remember the intimation of Gale, that "the world is a universal temple, wherein man may contemplate natural images and pictures of Divine wisdom and goodness;" and admire Richardson's expression, that the divine Being, instead of verbally announcing certain truths, "put it into the things;" we are aware of the Hutchinsonian sentiment, that the objects which nature presents to man are "like drawings of such things as were out of the reach of his senses;" and of the remark of Kirby and Spence, that "the entire system of nature is representative as well as operative;" and we remember—for who can forget?—the immortal "Analogy" of Butler; nor are we unacquainted with "the Sentiment of Flowers," and "Flora's Interpreter," and

such small craft, all doing their little to turn nature's great *forilegium* into a school-girl's album, full of the amatory, mawkish, and nonsensical; but Mr. Bayley aspires to consider nature as a divine revelation, to restore the holy oracle to its shrine, and to invest the willing reader with the Urim and Thummim. And, in our estimation, his conception of the work is as novel as its execution is vigorous. It consists of two parts: first, proving that nature should be considered as a revelation; second, containing specimens of the manner in which the material revelation may be explained.

The first part, distributed into thirteen chapters, shows that nature must be a revelation of much moral and scientific truth, because for ages man had scarcely any other; that there is an evident adaptation in nature to impart, and in man to receive, such instruction; that this mutual relation could not have been accidental; that the great service which the natural revelation still renders to morals, warrants the general conclusion, that nature is the only revelation, and almost ever has been, to four-sixths of mankind; that the material revelation has many advantages over the verbal; that it illustrates the Divine character and government, and the character and condition of man; and that there are obvious analogies between the verbal and the material revelations.

The reader who looks over the table of contents only to select a chapter, would most likely turn to the sixth, on the advantages which the material revelation has over the verbal. And as the book has put us into a benevolent and happy mood, we will give it entire.

"The material revelation is cognizable to the senses; but the things which are of the highest consequence to man, because eternal, are invisible. This, to a perfect mind, would be no evil, because truth, whether visible or not, present or future, would operate to its proportionate value. But 'the entrance of sin' raised the temporary value of matter above mind; and, in so doing, it made the region of sense more influential than that of spirit. The fields are visible; and, to an undevout mind, the lessons they teach are more impressive than the music of heaven, or than the walls of the damned. The harvest is a present good; but the ultimate consequences of our character and conduct are removed to a distant time, and to an immaterial world. A leaf is an indisputable object; but a word may be confounded by critics. A plant appeals to every sense, and is neither liable to the sophist's art, nor to the sceptic's perversity; but a sentence may be mystified by learning, or injured by transcribers. A hand adapted to its duties is a mixed mass of physical and moral evidence, which none but the fool denies; but a book may be doubted, a fact may be controverted, an allusion may be mistaken, a testimony may be forged. In nature all the objects may be examined, and all that belongs to it may be submitted to every possible test, it is handled by children, or analyzed by men; but in revelation nothing is visible except words, which are but the shadows of the vast thoughts that are only realized and seen, in their 'full stature,' in eternity.

"And the material revelation is universal. But we have seen that, with all the activity of letters, the zeal of the religious, and the circulatory aids of commerce, the verbal revelation is confined to a very small section of the human family. How few are the students who pore over its page! And even in that partial use of the verbal revelation, what difficulties present themselves from the three thousand and fifteen dialects of this many-tongued earth! How few scholars ever become competent to translate! How few translations merit the entire confidence of the illiterate! How various the customs of countries! How peculiar their superstitions! How idiosyncratic their institutions! How obscure their histories! How different the national passions! Marked is their natural history, and individualized is their commerce. And yet these must be all known so far as they relate to Judea; or the verbal revelation, which contains at least twenty thousand allusions to such subjects, must be, just so far as ignorance prevails, a 'sealed up fountain.' Now, the material revelation has no such obstacles or defects. Its sense depends on no conjugation of a verb, on no inflections of a noun, neither on idiomatic anomalies, nor rhythmic laws; nor is it modified by accents or prosody. But nature appeals with the same form, and discourses in the same language, to a million different minds; yet she establishes in each the same facts, and might excite in all the same influences. Besides, the sameness and propriety of nature are constant advantages. Lebanon bears not the Iceland moss; nor are those vegetable inns for the desert-pilgrim, the cow and water plants, found in Ireland. The Dead Sea never exhibits a swirl choir of water-spouts, dancing to the thunder, and sucking up, with their food-drinking mouths, its putrid and hideous waves; nor does the Pacific, where such wonders occur,

poison its shores with the maledictory salt, to forbid the approach of animal or vegetable life. England has not the volcanoes of Owhyhee; nor France the boiling fountains of Hecla. Scotland boasts its mountains and its lakes; while Switzerland possesses avalanches of eternal snow, which sometimes fall in mountain masses, with a silent dreadfulness, at the mere vibrations of the human voice, the fairy tread of the curling mist, or from the impulse of the passing eagle's wing. All the pages of the material revelation, like those of the verbal, are various; but they are filled with fact, are simple and sublime. Where is the land undecked with Divine goodness? Where the hill which is not crowned with a wood, if not inlaid with ores, or beautified by dancing streams? Whose eye roams far for an interesting natural page? Who makes the complaint that nature's lessons are few, that her colours are faint? Ah! none: 'Her lines are gone out into all the earth, and her words unto the end of the world; and there is nothing hid from the heat thereof.' Nature is all instruction, all authority, all impression; whether you climb to the ragged horns of the Cordilleras, grope into their caverns, where no other beams of light have struck since the deluge than those from the jaguar's eyes, or from the awful pupils of the guacharo; or whether, from the centre of the earth, you stray to its poles, where animal and vegetable life mainly exist in extremes.—monsters of power and ferocity, with moss and shrubs that stoop beneath the snow.

"The material revelation is also unaffected by any of the changes which, by continually altering society, are modifying its literature. No Vandal hordes can blot out its inscriptions or burn its library; the middle ages stifle not its tuition nor confound its tones. No loss is here sustained by the change of languages; nor have we to study the opinions of men half a life before we are supposed competent to explain its facts, or elucidate its examples. Not the critic's spleen nor the satirist's pun affect it. After Europe has changed its language ten times, the terms of the material revelation are unaltered. Does Africa jabber in a thousand ruleless languages? Does Asia forsake her venerable tongues? Is America, the modern Babel, forming a new race of languages from the refuse of the old families? Nature changes not hers; she owns no authority, she suffers no provincialism in her universal speech. The larks now carol the same song, and in the same key, as when Adam first turned his enraptured ear to catch the moral. The owl first booted in B flat, and it still loves the key, and screams through no other octaves. In the same key has ever ticked the death-watch; while all the three-noted ships of the cricket have ever been in B since Tubalcain first heard them in his smithy, or the Israelites in their ash-ovens. Never has the bus of the gnat risen above the second A; nor that of the house-fly's wing sunk below the first F. Sound had at first the same connexion with colour as it has now; and the right angle of light's incidence might as much produce a sound on the first turrets of Cain's city, as it is now said to do on one of the pyramids. The tulip, in its first bloom in Noah's garden, emitted heat four and a half degrees above the atmosphere, as it does at the present day. The stormy petrel as much delighted to sport among the first billows which the Indian ocean ever raised as it does now. In the first migration of birds they passed from north to south, and fled over the narrowest parts of the seas, as they will this autumn. The cuckoo and the nightingale first began their song together, analogous to the beginning of our April, in the days of Nimrod. Birds that lived on flies laid blueish eggs in the days of Joseph, as they will two thousand years hence, if the sun should not fall from his throne, or the earth not break her harness from the planetary car. The first bird that was caged oftener sung in *adagio* than in its natural spirit, as it does in the parlour of my fat friend, who was a zealot for the liberation of the slaves, and yet keeps two of these charming creatures in a square of one foot, though freedom and space are to them more essential than to man. Corals have ever grown edgewise to the ocean-streams. Eight millions two hundred and eighty thousand animalcule could as well live in a drop of water in the days of Seth as in ours. All flying insects had on their coats of mail in the days of Japhet, over which have ever waved plumes of more gaudy feathers than the peacock ever dropped. The bees that afforded Eve her first honey made their combs hexagonal; and the first house-fly produced twenty million eighty thousand three hundred and twenty eggs in one year, as she does at present. The first jump of the first flea was two hundred times its own length, as it was the last summer. That concubinal sinner, the ursine sloth, who scorns at all the anathemas against polygamy, kept ten or twelve wives before Moses was born, as he will when we are forgotten. There was iron enough in the blood of the first forty-two men to make a ploughshare, as there is to-day, from whatever country or men you select. The lungs of Abel contained a coil of vital matter one hundred and fifty feet square, as mine; and the first inspiration of Adam consumed seventeen cubic inches of air, as do those of every adult reader. The rat and the robin followed the footsteps of Noah, as they do ours. But why enlarge? Has nature's pendulum ever altered its strokes? Does some seraph come occasionally to earth to lower its screw, and diminish its motion? Or does the almighty Wisdom ever shorten its fall, to increase the activity? Are not these features of eternal regularity commendatory of the material revelation?"—Ep. 54-58.

The style and manner of the author often remind us of Sir T. Browne. But on these and certain other particulars we shall reserve ourselves for another "Miscel-

lany;" for as the book is by no means an ordinary production, we cannot dismiss it in an ordinary manner. By way of whetting the appetite of the reader for the next repeat, let him take the following specimens of the manner in which the material revelation might be explained. Class I., quadrupeds:—

"The Zebra teaches that the quality of the skin too often settles the fortune, if not the value, of a person. A zebra is an ass, with a more beautiful skin, but not half so useful.

Illustration.—How commonly the female part of the world depend entirely for their fortune on this quality! Many a play-girl has been raised to the peerage, and some women have become queens, merely because they had those great virtues, a fine skin, form, and voice!

"The Bull teaches that one bad quality often renders many good ones useless. The uncertainty of the bull's temper makes his strength and surefootedness of little use in husbandry.

Illustr.—A servant may be quick, clever, polite, industrious, and careful; but if a liar, all the other virtues are nearly useless.

"The Ouran Outang teaches that the form of man, without his mind, is of little worth. This animal is the wild man of the woods.

Illustr.—What a proof of a disordered world, that the mere animal form of man, instead of his qualities, should often rule his destiny! In the camp, in the affairs of love, and in the service of the rich, the man who bears the same relation to others as the ouran-outang does to the monkey, mostly fares the best.

"Swine teach that no mere cultivation will refine some natures; clean the swine, and feed it how you will, it prefers the puddle and the mire to the finest room!

Illustr.—I knew a gentleman who loved a poor girl, educated her expensively with great care, and then married her; and when he had done so she vowed that she loved his servant-boy more than the master, who was not an ugly but a well-bred gentleman.

"The Bear teaches that many do little good till they are dead: as the bear is chiefly valuable for its skin, hams, and grease.

Illustr.—Of this class are misers, the vicious, tyrants, &c. William Law died worth £70,000, but while he lived he gave nothing away, left his poor relations to pine for bread, and by his will devoted his property to a public institution.

"The Rhinoceros teaches that nothing is so well defended but it may be somewhere injured; even this animal may be wounded in the joints.

Illustr.—There is no mind, however fortified, which has not its sore part. A philosopher will bear you to gibe him with his poverty or dress; but—sneer at his judgment!

"The Ferret teaches that one evil is often employed to overcome another. We use the ferret, itself a vicious animal, to destroy the rat.

Illustr.—We employ medicine, itself disagreeable, to remove pain; labour to prevent want; or the army to check the operation of abused physical force.

"The Ichneumon teaches that little persons may prevent great evils by crushing them in time. The ichneumon destroys alligator-eggs!

Illustr.—The boor who mends the sea-dikes in Holland, saves it from an inundation; or the schoolmaster who checks the ambition of his pupil, saves the world from a tyrant.

"The Camelopard teaches that superiority has always some disadvantage equal to it. The camelopard has the beauty of the deer, the camel's neck, and is the tallest quadruped; but it is timid, defenceless, and slow.

Illustr.—The great have more wealth, but less freedom than the poor. They live in palaces, but they always move with the ceremonial chain.

"The Sloth teaches that the peculiarities of our nature are often mistaken for vices or virtues, though both must be voluntary. The sloth is so called from its supposed indolence, though its motion is to it happiness, and necessary to its being.

Illustr.—When I was a boy, I saw many abused for their dullness and want of spirit; and my friend is lauded for his intellect, which is no more a virtue than that dullness was a vice.

We must quote a few paragraphs relative to birds.

"The Swan teaches that every thing is beautiful in its proper element. On land the swan is the most awkward, in water the most graceful of all birds.

Illustr.—A ploughman would not be more awkward at court than a peer at plough, or in the smithy. What would a countess do in the kitchen or the mill?

"The stork teaches that many virtuous people are taciturn. The stork neither sings, talks, nor hoots; but it carries its worn-out parents to its wings!

Illustr.—Persons who say the least are often both wise and devout. Two of our most popular authors, one male and the other female, who recently died, were taciturn.

"The Ostrich teaches that the least important points about

us are often the most valued; as, the tail feathers of the ostrich, the skin of woman, the titles of men, &c.

Illustr.—One of my acquaintance boasts, unceasingly, that he is descended from one of the freebooting esquires of William the Conqueror, and would rather be praised for that than for kindness!

"The Swallow teaches that there is a very great art in knowing one's time, and a great virtue in being punctual to it. The swallow never omits to come at the approach of summer.

Illustr.—

'There is a tide in the affairs of men,
Which, taken at the flood, leads on to fortune.'

We may be very diligent and clever, but if at the wrong time, it will be of little use.

"The Linnet teaches that we are not to judge of abilities from mere external appearance. Who would think that such a plain bird as the linnet could sing so well?

Illustr.—If judgment had gone by appearance, nearly the whole race of genius would have been proscribed.

"The Goose teaches that there is a great difference between our real and our imaginary height. The goose stoops in passing under an archway six feet high, lest its head should strike against the top.

Illustr.—Our imaginary height is fixed by ourselves. Our real stature is the average between the opinions of our friends and enemies.

"The Cuckoo teaches that many persons will work for the public, and leave their family to starve; as while the cuckoo sings, it abandons its young.

Illustr.—How many of our crispin politicians and beer-shop statesmen do this daily!

"The Woodpecker teaches that as much as possible we should economize our labour. The woodpecker never bores through the bark till it knows that insects are beneath it.

Illustr.—We should always look at the probable results of our labour before we perform it.

"The Ruff teaches that, in the animal world, the females are the least showy; in the human world they are the most so.

Illustr.—This is, however, only true in civilized society, and chiefly in those countries indebted to Christianity.

"The Spoonbill teaches that the mouth is made to suit the meat. What would the sparrow and the spoonbill do with exchanged beaks?

Illustr.—This is one of the many arguments in favour of the existence and goodness of God, which the material Revelation furnishes.

"The Duck teaches with what powers God can endow the meanest creatures; that, out of the garbage which the duck eats, its stomach should extract such fine flesh.

Illustr.—The capabilities of matter, therefore, depend on what God determines that matter should be. He could make a porous stone as musical as the harp.

"The Cock teaches that nature made clocks before man. Formerly, the divisions of the night were only known by the cock crowing.

Illustr.—In the poor and rural districts the labouring men will acquire great accuracy in finding out the hour of the day from the length of the shadows, or from the habits of animals.

"The Lark teaches that the nearer we rise to heaven, the more sweetly we should sing; as the lark sings the best when it ascends towards the skies.

Illustr.—An advance in religious character should be marked by an increased sweetness and harmony of dispositions, which are the music of the mind.

"The Redbreast teaches that we should be cheerful in the worst times, as there is no winter, however severe, in which the redbreast does not sing.

Illustr.—Cheerfulness in adversity 'breaks the fall of sorrow's wave.' Mons. Ducrow escaped unhurt from the Bastille, after a confinement of fourteen years, because he endured it cheerfully.

"The Nightingale teaches that remarkable persons must expect that many fictions will be told about them; as it was long said, the nightingale sang the best when pierced by a thorn!

Illustr.—This is one of the fees which fame ever exacts from the distinguished.

"The Eagle teaches that great minds are not much formed for companionship. It is a rare thing to see a pair of eagles; and no one ever saw the eagle and the blackbird together!

Illustr.—Who ever saw a flock of eagles? But who has not seen a flock of geese? I do not know that either Milton or Locke had an 'intimate friend.'

"The Jackdaw teaches that some minds see no interest in many objects until they have ceased to possess it in the estimation of others. The jackdaw is fond of old towers, steeples, and buildings.

Illustr.—Of this class are the antiquaries, who see little charm in a building until it is old; and some poets, who are sooner inspired by desolation and ruins, than by life and its wondrous arts.

"The Crow teaches that a bad taste is often very acute. Crows smell carrion at a great distance.

Illustr.—Neither acuteness nor taste is always the property of good men. Paine was a powerful writer, but a drunkard; and Shelley was remarkable for his taste and his infidelity."

THE COMING SPRING.

I SING the spring :—

"The spring, the spring, the beautiful spring."

Whose heart does not leap up at the sound ? It renews one's youth like the eagle's. It makes one feel all over wings ; requiring weights and policemen, like the monster balloon, to keep one down. But the allusion reminds me of the murky town. *I live in the country* : what will the poor townites say to that ? I know what they ought to say and to do ; let them acknowledge my superiority, and take off their hats, and stand while I address them. Talk of classification ! what division of the human race so simple, natural, and comprehensive, as that which distributes it into city-dwellers and country-dwellers ? Do you require proof ? "God made the country, and man made the town :"—there the point is settled. Even you poor town-dwellers have your anticipations of the coming spring—anticipations bright as a farthing rush-light in a fog ; you expect your two or three stinted and imprisoned trees will find out, somehow or other, that the season of spring is at hand, and will try to look green. Hope is the evergreen, the perpetual spring of the heart—and you hope to hear your cockney sparrows give two chirps instead of one, and to see them fly by your windows with bits of string, in default of hay and straw ; and you hope your poor confined mignonette will smell as sweet "as can be expected ;" and that your two or three sickly shrubs—which, though not dead, are decently buried—will still hold up their heads. And even the poor Esquimaux, at Wapping and thereabouts—with their arctic winter and polar fogs—are no doubt beginning to hope ; not that they expect to see more summer for the present, but a *little* less fog.

Oh ! who does not love the country ? It is a passion born with all ; an element of our common nature, infused at the creation of the kind ; a flame that lives on unextinguished even amidst the brick-and-mortar influence of town—

"Where nothing feeds it ; neither business, crowds,
Nor habits of luxurious city-life,
Whatever else they smother of true worth
In human bosoms, quench it, nor abate.
The villas with which London stands begirt,
Like a swarth Indian, with his belt of beads,
Prove it. A breath of unadulterated air,
The glimpse of a green pasture, how they cheer
The citizen, and brace his languid frame !
Even in the stifling bosom of the town,
A garden, in which nothing thrives, has charms
That soothe the rich possessor ; much consoled
That here and there some sprigs of mournful mint,
Of nightshade, or valerian, grace the well
He cultivates. These serve him with a hint
That nature lives."

Oh ! who does not love the country ? "We are here," says Cowley, in language more passionate than can any where be found in his
[No. 6. FEB. 8, 1837.—2d.] Vol. I.

passionless poetry, "we are here among the vast and noble scenes of nature ; we are there among the pitiful shifts of policy : we work here in the light and open ways of the Divine bounty ; we grope there in the dark and confused labyrinths of human malice : our senses are here feasted with the clear and genuine taste of their objects, which are all sophisticated there, and for the most part overwhelmed with their contraries : here is harmless and cheap plenty ; there guilty and expensive luxury."

But what has this to do with the coming spring ? What ? why, is it not very introductory ? and would you rush into the presence of such a subject without a formal introduction ? With this preparation, then, we proceed. And, first, has it never struck you as a thing to be wondered at, that of the five hundred and one essays, odes, sonnets, and verses written last year on the four seasons, just five hundred were devoted to them while current, or else celebrated their glories when they had passed away ; and that only the odd one (and that a very odd one indeed, of which the least said the better,) looked forwards, and antedated the object of its regard ? I propose to add another.

I have just been strolling abroad to refresh my vernal associations. It is true the landscape still wears a bald and wintry aspect ; and a month, at least, must yet elapse before it will assume a much lovelier hue. But I need not wait till then, thought I, in order to enjoy a foretaste. The spring is even now invisibly at work in ten thousand times ten thousand ways. Nature, at this moment, is a vast laboratory, in which all her vital elements and divine essences are in process. The omnific word has gone forth,—*"Let the face of the earth be renewed,"* and all the agents of the material universe (and many of the spiritual too, for aught we know) are busily obeying the fiat. Below the brown surface of that ploughed land there lives, and wakes, and works a sleepless principle, which is silently but irresistibly converting these clods into food, and life, and beauty. That bank is covered, at present, with nothing but grass, but he who has an ear to hear will hear, if he bends and listens, a sweet whispering below, between a violet, a daisy, and a wild primrose, about an annual visit which they have lately received, and which has put them all in the highest spirits. That old hawthorn looks dead, but not he ! spring has touched his remotest and minutest fibres ; his juices are already ascending, and every thing within him is saying—"only wait a little, and you shall see me one white impurpled shower of fragrant blossoms." In all her myriad ways Nature is abroad, reviving her works, shedding her perfumes, mingling her colours, breathing on her seeds, and calling her beautiful children to

life. The very air owns it, and is balmy; the soil feels it, and inhales the incense of gratitude; that cloud, so different from the clouds of winter, so soft and wreathy, and like the dew-filled fleece of Gideon, comes spring-loaded from the great Giver—one of the wishes of nature fulfilled. Only stand still, and listen; all is silence, the silence of hope, of assured expectation. The very birds, for the moment, are hushed; but it is only the hush of pleasing suspense; let the signal be given, and out they will burst into a glorious chorus. Did you note that slight rustle among the branches? was it not soft as the folding of angel-wings? It was nature breathing over her beauties.

But I need not tax imagination in order to see the spring. Already its outward and visible signs are every where around me. Yesterday morning, on visiting my garden, I descried that welcome messenger of spring, the *galanthus nivalis*, or snowdrop. There it lay "beneath its white coverlid, so pure and pale, so true an emblem of hope, and trust, and confidence, that it might teach a lesson to the desponding, and show the useless and inactive how invaluable are the stirrings of that energy that can work out its purpose in secret, and under oppression, and be ready in the fulness of time to make that purpose manifest and complete." A little further on, a group of hepaticas smiled to receive me; the fringed star of Bethlehem and the spring bulbocodium were trembling with delight—a crocus was looking like a whole spring in itself—a primrose spoke to the imagination of thatched cottages, and sloping banks, and woody dells, and happy children—and a violet, without holding up its head, spoke to the heart of modest retiring beauty, and the fragrance of virtue. Going forth again, in the open weather of the evening, I was greeted with other harbingers of spring—less lovely to the eye, indeed, than those which I have named, but far from unacceptable to the lover of nature—the grey slug, and the homely earthworm, and the bat, just awoke from its winter's sleep.

Before I left home this morning for my walk, a redbreast, which I have fed through the cold weather, came to my window, sang as merrily as a robin can—thanked me for all past favours—

and said, as plainly as he could, that he was about to look out for a "better half." A tom tit and chaffinch were by and heard him, and signified that so good an example deserved to be followed. As to the sparrows, they have all paired, and are furnishing their houses. But what large bird is that winging its way on high, as if from the sea-coast? surely it is the curlew; then he is retiring from his winter haunt to his inland breeding-place. And, hark! the lyric sky-lark is aloft at heaven's gates, raining down a shower of music to the earth; and there bursts forth the song-thrush, singing "as if he would never grow old," and as if the six pure scarlet drops in his body were *elixir vitæ*; and there darts by a bee, humming as merrily as if all the world were a hive, or every thing in it flowers and honey.

Man of the city! dost thou not almost wish for a country calenture, that thou mightest taste the spring, if only by the force of a diseased imagination? Wilt thou not treat thy poor wheezing lungs with a little country air? Dost thou not long for "the key of the fields?" Wouldst thou not give thy freedom of the city to be made free of the green paths,—

"The haunts of deer,
And sheep-walks populous with bleating lambs;
And lanes, in which the primrose ere her time
Peeps through the moss that clothes the hawthorn root?"

Will thy street-music compare with that music of the flock? or thy dancing dogs with the joyous gambols of those new-year lambs? Hear what Milton saith on the subject: "In those vernal seasons of the year, when the air is calm and pleasant, it were an injury and sullenness against nature not to go out and see her riches, and partake in her rejoicing with heaven and earth." Dost thou not feel inclined to go forth at once? Is not the spring strong upon thee, and the sun shining in upon thy heart? Lift up thy voice, then, and sing of "the coming spring:"—

"Hail, bounteous spring, thou dost inspire
Mirth, and youth, and warm desire;
Woods and groves are of thy dressing,
Hill and dale doth boast thy blessing.
Thus we salute thee with one early song,
And welcome thee, and wish thee long."

SITTINGS FOR MY PORTRAIT.

FIRST SITTING.

AFTER the usual number of friendly contests between the powers of persuasion on the one side, and the less vigorous and persevering efforts of doubt, hesitation, and objection on the other, I sat down quietly to suffer or to enjoy, as it may be variously interpreted, the painful pleasure of having my portrait taken. Aware (for it was

not the first time of my being introduced to a similar Elysium) that it was important to the artist to feel myself unconstrained and at ease, that I might not be exhibited on the mimic canvass in a stiff and formal attitude; convinced, also, that as he was to paint the exterior, not the mind, which might therefore range wherever it

pleased in unfettered freedom ; unwilling, besides, to give so many hours to mere vacancy and in-occupation, I resolved to employ myself in some train of reflection, or some reverie, which might entertain, perchance improve, the time ; and on each occasion, after the painter had finished with his pencil, to take my pen and sketch a portrait of my thoughts.

This was a day eminently favourable to those fancies which delight the imagination ;* the elements were in a state of turbulence and confusion, the rain descended in torrents, the clouds flew about in the wildest disorder, and the winds came roaring from their caves. Pitying the poor creatures who were forced to brave the whirlwind and the storm, some with the miserable defence of an umbrella, now and then turned inside out, and others shrinking into their cloaks or great-coats upon that "bad elevation" in a tempest, the top of a coach, I soon withdrew my eyes from the window, and fixed them, as he desired, upon the painter. He, however, soon vanished from my sight amidst the visions of an ideal scene.

"Be good enough, sir, to look at me. There, that will do ; the position is excellent."

The wind was perfectly tremendous, howling like unkennelled dogs baying to the moon, then rushing like the ocean-billows lashed into fury, till imagination pursued it into another region, and heard those kindred sounds of terror which agitate the distant wilderness. In truth, a few moments presented to view a vast and apparently boundless forest. I traversed it in various directions, and saw birds of every feather, and beasts of every name. Few indeed were the scenes of peace and love ; the general movement was indicative of hurry and hostility ; the fowls of heaven fluttered to the conflict, and the vulture's eye directed his rapacious fang to the field of carnage. At length, reaching an extensive enclosure, which seemed to comprehend several miles in length, and not a few in breadth, I paused on the brink of a river running along a valley in which the mountain slopes on either side terminated. From different openings in the forests I observed a variety of animals emerging and forming themselves into hostile groups. My ear soon became affected by a confusion of sounds, such as may be easily conceived to proceed from the commingled voices of strange utterances, in none of which were to be recognised the least resemblance to intelligible speech. The dreaminess of a reverie, however, seems to produce, for the time, a kind of new sense, so that in a few moments I found myself capable of un-

derstanding enough of the language employed to enable me to transfer the meaning to my own ; in fact, by that rapidity of motion of which the mind under such impressions is susceptible, I became the attentive hearer of a long and ardent debate ; with the conclusion only of one speech I shall make my reader acquainted ; he will, I trust, not question the accuracy of my translation of the following braying of an ass :—

"What signifies your roaring, Mr. Lion ? and your stamping and snorting, Mr. Horse ? or your twirling and twisting of that ridiculous trunk, Sir Elephant ? I tell you we shall not submit to yield one inch of this part of the realm to you. Keep to your forest, keep to your ground. I promise you we will fight to the last. You may push, and you may bite, and you may tear ; but we can kick and bite as well as you, and, on our side, are resolved to keep this little plot, and have free range along this western side of the river. You say, 'What do you get by fighting but blows and blood ? and may, besides, lose your territory.' Some one says, too, 'Why not have all the forest in common, or at least live in peace ?' Tush about peace. We will have our own ; and, blood or no blood, we hurl you defiance." Upon this a mighty acclamation followed.

I now beheld each party making arrangements for a furious onset. A mottled line of wolves, tigers, leopards, and wild beasts of every kind, arranged themselves in furious opposition, and moved on irregularly till they met in combat. The air soon resounded with the yellings of the wounded, and the ground was overspread with torn and lacerated carcasses. Dissatisfied with their first encounter, they returned again and again to the charge. At certain intervals I perceived that efforts were made to arrest the carnage, and proclaim a truce ; but passion raged, calls of honour or of gain were uttered and re-echoed, and the war raged with ever-increasing fury. In the midst of the awful din the elephant raised his voice and exclaimed, "On, on, we shall win the day ; on, brother animals——"

"Have the goodness, sir, to relax that stern look, and sit a little round," said the painter.

The vision in an instant fled, but not without leaving behind a subject for reflection. O the folly, the recklessness, and the guilt of those kindred brutal passions which agitate and convulse human society ! How wise, thought I, the philosopher, and how dignified the Christian, influenced by still nobler principles, who can sit, as I sit to my painter, amidst the war of elements, far from the strifes of prejudices, temper, and ambition, possessing his spirit in tranquillity !

Man has been sometimes called "a superior animal ;" to the latter epithet he has indubitable claim ; animal he unquestionably is, in his physical constitution allied to the material and animate creation, a compound of instincts and bodily senses. If the vastness of the all-surrounding

* It happened that I was sitting for my likeness at the very hour when the most violent tempest, or hurricane, that has visited England for many years occurred. It was toward the close of the last year, and has left many a sad memento behind, in the total wrecks of shipping on our coast.

universe be considered, he might be described of the entomological species,—a *brute* often, but an *insect* always. What a worm amidst worms! In some forms and modifications of his being inactive and sullen like the chrysalis; in others, fluttering about, amidst the business and bustle of this terrestrial scene, like the butterfly, with its gauzy pinions and brilliant reflections of light. The insect, the animalcule, the infinitesimal orders of existence, through all their descending gradations, do but constitute so many portions of living matter, smaller or larger, of which he is one; and to moderate any self-estimation, be it observed, too, that if he surpass in corporeal stature and magnitude millions around and beneath him, he is surpassed by millions more. Does he, on this account, look with contempt upon the worm or the fly, and swell with a proud inflation when he takes his microscopic glass to peer into the otherwise hidden regions of a miniature creation, thinking how many millions of these puny things are swimming in what to him is indeed a drop, but a mighty ocean to them? Let him recollect that he has only to look abroad, and he will discover the earth peopled with tribes which, like the scaly rhinoceros, or the ponderous elephant, may, in their turn, scorn his littleness and feebleness of bulk and limb.

But it may be inquired, Is not man still worthy of the name of “a superior animal,” notwithstanding his comparative insignificance in the general scale of creation, or even the restlessness and sometimes the brutality of his passions? Considered only as an *animal*, the question might involve much perplexity; but, viewed in other respects, he rises into higher relations. Small and circumscribed, however wonderful, in bodily organization, and even low in many of his instincts, he possesses the higher endowments of reason, and the blessed gift of immortality; so that if the spirit of a beast go downward, his shall aspire upward, in the hour when the mortal elements sink into dust. If connected by his corporeal nature with all that is material, he is allied by his soul with all that is spiritual and eternal. If he be now the inhabitant of the merely sensible and sensual world, he is the expectant of the immortal, the intellectual, and the infinite state; and even now is elevated above the material system, by amazing capacities and predestined associations. Man, then, is a being of extremes, as nobly sings the poet,—

“How poor, how rich, how abject, how august,
How complicate, how wonderful is man!
How passing wonder He who made him such!
Who centered in our make such strange extremes!
From different natures marvellously mix'd,
Connexion exquisite of distant worlds!
Distinguished link in being's endless chain!
Midway from nothing to the Deity!
A beam ethereal, sullied and absorb't!
Though sullied and dishonour'd, still divine!
Dim miniature of greatness absolute!

An heir of glory! a frail child of dust!
Helpless immortal! insect infinite!
A worm! a god! I tremble at myself,
And in myself am lost.”

It is always necessary to distinguish between the endowments of an intellectual elevation and the characteristics of moral superiority. Mere sagacity confers a certain kind of superiority, but it is not the highest and the best; nay, more, it may become the instrument of a real degradation. True excellence depends on the *use* of the powers which our Creator has conferred upon us; their *mere possession* is but the *means* of good or evil. Hence the true greatness of man is to be seen only in a virtuous pre-eminence,—the right direction of his faculties, and the consecration of his being to God. Hence, therefore, his insignificance and baseness consist in the depravation of those faculties,—in the turbulence of his passions, and the demoralization of his reason.

What, then, with the facts which present themselves at every turn, are we to infer? If it be conceded that, in the capabilities of his rational nature, he surpasses the brutes that perish, what are we to think of his assumed pre-eminence when we observe his moral debasement? It might surely admit of an argument, and perhaps more than a plausible one, whether, taking every thing into view, where religion does not transform and elevate, man is not an *inferior* animal. Might not this inferiority be pleaded, on the ground that he has vitiated his nature, and desecrated powers which the other animals never possessed? He, in short, is capable of crime which they are not; so that if they cannot rise to the level of his natural faculties, they are equally incapable of sinking to the depth of his guilt and misery; and thus it would appear that, though superior by nature, he is inferior by crime; because, while animals and men are equally the subjects of strong passions and fierce resentments, the latter, by being made higher, really descend lower, and degrade and ruin a moral constitution, which has been formed for the sublimest purposes of existence.

And is not the world actually a scene of turbulence and confusion? Can we fix on any place that is exempt from the rage of passion? Where has not war prevailed? Where have not animosities been kindled? Where have not families, tribes, and nations been divided? Where have not men, at some period, been hateful, and hating one another? And where is there even now, amidst the very illuminations of Christianity, a paradise on earth of peaceful, united, and holy beings? Christianity, indeed, confers the real superiority, which otherwise cannot exist; but without it the animal predominates above the intellectual man, and, in the contest of claims, asserts and maintains a dominion.

In thus bringing into view the confusion of the world, the constant and perfect superintend-

ence of an all-wise Providence must not be overlooked. Were this the ultimate state of society, it might be difficult to comprehend, or even to conjecture, the reason of what is so apparent; but to determine on the real character of the Divine administration by the chaos of the present moment, would be as absurd as to pronounce upon the painter's skill or purpose by the first sweep of his pencil, or the mixing of his colours.

This sin-smitten part of creation is indeed a moral chaos; yet are the disordered elements overruled, and working towards a grand development hereafter. No passion, and no combination of passions or efforts, can pass beyond a prescribed limit; and let us ever be consoled amidst temporary evils, that this is the great moulding and modifying season, the season of preparation for another and a perfect order of things. Y.

MAIDEN AUNTS.

Who among us of the age of forty and under has not a maiden aunt? That would, indeed, be a singularly unfortunate and, necessarily, unhappy family which should not number a maiden aunt among its members. Nature has apparently, in some degree, provided against such an occurrence; for we are assured by statistical writers, that in a given number of births children of the gentler sex predominate; and the artificial state of society in which we live, by increasing the number of our wants, and otherwise multiplying impediments to marriage, completes what nature began, and secures to each successive generation the advantages derivable from the example and superintendence of maiden aunts.

I have a sort of Platonic affection for those inestimable beings rudely and ungallantly called "old maids;" and much do I lament the narrow and vulgar prejudices which exist against them. I do not mean to say that I admire that imaginary being which is popularly set forth as the type of the species, just as a skeleton is used to represent death, and a black hide, horns, a tail, and cloven feet, the "archangel fallen," who has been so differently drawn by Milton. I have no sentimental love for the old maid of our popular prints—a lean, wrinkled, yellow hag, with snuffy beard, blue lips, rheumy eyes, and a pursed chin, to the tapering termination of which feature the nose makes a most *pointed* approximation, with an arm like that of one of the baked corpses at Aleppo, a gimlet elbow, and a fist like the claw of a vulture. I discard entirely these abominable fictions, high-heeled shoes and all; and will only think and write of the antiquated spinster as I find her in actual life. Not but that there are some individuals of whom the popular caricature is but an exaggeration; but I must protest against the exception being constituted the type. The cross old maid would, undoubtedly, have been a snappish wife and scolding mother; and it would be quite as just, because there are unamiable and disagreeable wives and husbands, to libel and ridicule the state of matrimony.

The being who is now present to my mind's eye is sometimes fair, sometimes dark, sometimes tall, sometimes short, sometimes attenuated in her figure, and at others "more fat than maid

beseems;" generally good tempered and chatty; somewhat too anxious, perhaps, about trifles, and a *wee* bit (I am not a Scotchman) too fond of tea-table tittle-tattle, more especially when comfortably seasoned with the curry of scandal.

Your old maid has a keen perception of the universal declension of the present age. It is often a subject of lamentation with her that the young ladies of the present day are more forward than those of "auld lang syne;" that the men are less polite; and that the reflecting surfaces of mirrors are much less perfectly manufactured than in the days of her youth. Nevertheless, your true old maid manages to make as much of the times as their degeneracy will allow.

I have heard it asked, "What is the use of an old maid?" We are bound, both as Christians and philosophers, to admit, that nothing is permitted that has not its use, whether perceived or not. It is difficult, no doubt, to decide what is the use of an earthquake or of a tornado; but the utility of the veteran spinster is obvious, more especially when contemplated in the character of aunt—that in which it is our purpose to discuss her.

In the first place, she is invaluable to her nieces. Being their chief companion, and having in her youth observed, and in after-life heard of numberless instances of impropriety and immorality of conduct on the part of young females, she narrates all these to her charge, with strict fidelity as to the most minute details; thus storing their young memories with a catalogue *raisonné* of *faux pas* and indiscretions which it is their duty to avoid. Then our aunt possesses, specifically, the faculty of being in twenty places at once. Every one must have observed that wherever there is an old maid—and where is there not one?—go into what apartment you may, walk in whatever direction, call on whatever friend, at whatever time, you will inevitably meet, overtake, or be overtaken by her; so that to her nieces is secured the perpetual felicity of her company. Then, being herself the model of female excellence, she will inevitably make her nieces paragons of propriety, and, if they follow her instructions and example in all things, qualify them to be, to the next generation of nephews and nieces, what she is to them.

To her nephews she is alike invaluable ; all the early knowledge they acquire of any thing beyond tops and gingerbread, they receive from her. She convinces them, or if she does not the fault is not hers, that learning is better than play, physic more salutary than lollypop, that history and geography are preferable to cricket, that it is better to write and exercise accurately than to set fire to the Dominie's wig, and that it is far more proper to remain in bed after having gone thither, than to escape by the window, and tie up a vagrant donkey to the knocker of some miserly old bachelor, who, in answer to the repeated summonses of the patient and contemplative animal, shivering, meanwhile, with fear and cold, opens the door, and draws into contact with his own the visage of what might well be considered the apparition of himself.

But the maiden aunt is chiefly useful to her male collateral descendants, by exercising their ingenuity, and sharpening their wits, when a year or two at school has rubbed off the respectful awe which she inspired in the atmosphere of the nursery. I know an individual, now a stated contributor to "Ward's Miscellany," who is very much indebted to his maiden aunt for whatever small quantity of wisdom he may possess, the said wisdom having been derived partly through the very excellent moral lessons which she was wont to inculcate, but chiefly through the exercise which she afforded his expanding wit, or, as she in her perverse words called it, "mischief." This was, of course, before the effervescence caused by the sodaic properties of her counsels, on coming in contact with the sharpness of his disposition, had subsided into the gravity and sedateness which have since marked his character. Had he never put back the clock and watches an hour, when a party was expected to dinner, (having first satisfied his own craving,) in order that he might witness the dismay of his dear aunt when the company arrived, (for your old maid is always the responsible mistress of the ceremonies,) and the broiling concern of the cook at the announcement of the hungry guests, before an interview had taken place between the poultry and the fire ; had he not laudably sought to improve his talents in the arts of penmanship and epistolary composition, by manufacturing letters purporting to have been sent from "the Great-house," to secure aunty's presence at some grand and select festivity ; had he never enjoyed that delicious scene—his highly respected relative setting out, bedizened with all producible finery, to arrive, like death, where and when least expected, and, like him, least welcome ; had not his maiden aunt, albeit unintentionally, by affording him opportunities of thus cultivating his talents, taught "the young idea how to shoot," perchance he had not now been worthy of the distinguished honour of being a contributor to "Ward's Miscellany."

The maiden aunt is extremely useful in preventing the need of a library. She is a living, walking set of the "Annual Register," especially as far as the family and neighbourhood are concerned ; not a fact, not a date escapes her. If you happen to say that, in the year 18—, you were crossing from Calais to Dover, when the gale was so strong that your personal safety was much endangered, she will question you as to the month and day ; and when you express uncertainty, will tell you that she has no doubt it was on the 4th of October, for a very boisterous wind prevailed on that day, so much so, that three slates were blown off the pigstye of her cousin in Hampshire, one of which was fatal to the flower of the litter,—

"The father's hope, the mother's joy ;"

and how the maternal parent was very visibly affected by the calamity. Then follow all the events, public and private, great and small, which happened on that day, and a great many which did not ; no incident is forgotten ; she has chapter and verse, or rather month and day, for every thing ; deaths, elopements, executions, marriages, and all other unfortunate events, are stereotyped in her memory.

The maiden aunt is also the pharmacopœia of the family and neighbourhood. The doctor is seldom required ; and when he is called in, she very much expedites the recovery of the patient by making such deviations from the treatment recommended as her superior sagacity and knowledge may suggest. She has twenty remedies for a cold, and at least fifty for toothach ; all infallible, as you may prove by making trial of them in succession. In fact, she has a multitude of remedies for all diseases, known and unknown ; and if any of the neighbours die, it is because they have the folly to call in members of the faculty, instead of trusting solely and implicitly to our maiden aunt. I never think, even now, of my maiden aunt, but the taste of jalap and currant-jelly passes over my palate, occasioning a shudder, which sometimes jerks my wig into a position very indecorous for a person of my years, and a contributor, albeit, to "Ward's Miscellany."

The maiden aunt is also the Almanac of the family—a matter of less importance than before the stamp duty was removed, for her erudition in this line now only effects the moderate saving of one penny per annum. As, however, even the penny Almanack will sometimes mislay itself, our aunt may be occasionally very useful ; for the saints' days, holidays, birthdays, eclipses, times of high tide, changes of the moon, &c., &c., are intimately known to her ; indeed, we are not quite sure that she cannot calculate the changes of the wind, a species of knowledge which we know no existing Almanac can supply.

Then the honour of the family is always en-

trusted to the keeping of the maiden aunt. Her memory has a bee-like property, and extracts honey from the meanest plant, rejecting every thing of a less agreeable flavour. So far are all facts reflecting credit on the family from being impaired by the action of time, that they have grown better by keeping, like wine, or like old cheshire cheese are all the richer for the maggots which have introduced themselves. You never hear a word about the cousin who was hanged in 1796; but you do hear that, in the year 1785, a fox was killed in papa's meadow, and that Lord —, and others of the hunting party, came in and were refreshed with a luncheon at papa's table; not omitting that Lord — complimented the flushed face and curd-like fingers of papa's daughter. She tells us, further, how her great uncle's brother-in-law was sheriff of London, with many other anecdotes equally honourable to her house, and interesting to her visitors; and altogether proves, most satisfactorily, that the Tomkineses or Jenkineses, as the case may be, are indeed a very distinguished family.

A fact in the natural history of the old maid occurs to me, which, as it is characteristic of, and peculiar to the species, should not be omitted. They never reach old age; in fact, they never

grow older than forty. I have known many at that age, and for years after; but from that period they never advanced; and if they made any movement it was backward, to five or eight and thirty.

Considering the subject of the foregoing pages in all its bearings, I think I may say, without fear of contradiction, that the abolition of maiden aunts would be a national as well as individual calamity; a fact which was duly appreciated by Mr. Malthus, and which, no doubt, very considerably influenced him in the adoption of his system of philosophy. In conclusion, I trust that the maiden aunt will remain unshorn of her honours in the ages which are to come. It will be seen that they are great favourites of mine; and I can conscientiously wish, in concluding this paper,

"To each and all a fair good night,
And rosy dreams, and alumbers light;"

and more, as the Spaniards say, "May they live a thousand years!" or, to adopt the more benevolent and comprehensive wish of the orientals, "May they live for ever!" and subscribe, the whole time, to "Ward's Miscellany."

A SCOTTISH SABBATH.

CHAPTER II.

Or the million and a half of human beings that compose the population of London and its suburban boroughs and villages, fully one-half never by any chance attend any place of worship on the Sundays, or make any difference between that day and the other days of the week; unless it is being more restless and dissipated than they are when they must attend to their business, their trades, or their professions. To this half of the population, the Sunday is any thing but a sabbath—it is the very opposite. Of the other half, by far the greater number content themselves with the mere formal ceremony of going "once" to a place of worship "for the sake of appearances," while, both before and after this formal display, they enter into the same kind of accustomed and worldly enjoyments as those who do not go to a place of worship at all. To these, also, the Sunday is not a sabbath. Then, as for the "servants" and the "cattle," it is a day of more severe labour than any other in the week. The six "working" days are, therefore, their sabbaths—if they have any at all.

The character of every place must be that of the majority. In London, a stranger has no feeling of the Sabbath from any thing he sees and hears around him. In Edinburgh, he becomes awed by its presence, and involuntarily joins with the multitudes that keep holy day. *Scotchmen, when they reach our southern me-*

tropolis lose every semblance of religion—and some, whose apostacy is not altogether free from the twinges of a northern conscience, and the apprehensive doubts of an unconfirmed infidelity—excuse themselves on the ground of the unsabbatical, unholy atmosphere which they are constrained to breathe, and which stifles all their latent religious propensities. As if religion and principle were a thing of time and place, and not immortal as the soul, and the very element of its moral being—unaffected by locality, unchanged and the same amidst all the varieties and mutations of human life. A sentimental exotic from the other side of the Tweed, taking root on the banks of the Thames, may tell us, that in the land of his fathers he was accustomed to the repose of a Sabbath in the whole of society and of nature around him—that here he cannot, for the soul of him, feel that the day which comes between Saturday and Monday is a Sabbath—that he is dinned, oppressed, and wearied with this working-day world in which a Sabbath has no place—and occasionally, when a shade of melancholy passes over him, as he thinks of the habits of his former and his better days, he may refer plaintively to the waters of Babylon, and murmur out something about singing the Lord's song in a strange land; and this sort of momentary and poetic penitence, he may mistake for religion, and vainly imagine, if he were to return

to his native glen all the spirit of his early piety would return with him. We admit, and do it with sorrow and shame, that a London Sunday and a Scottish Sabbath have little or no resemblance; and we marvel greatly that those who have been brought up in the strict observance of the latter should so soon conform to our loose southern manners; and while we blame ourselves for setting a misleading and dangerous example, we cannot acquit those who have been better instructed, and who, knowing what is right, scarcely wait to be tempted, but at once, and heedlessly, plunge into the vortex of dissipation, and on that very day which from the associations of their earliest existence they have been accustomed to reverence as a day sacred to piety—the day of God. But enough on this ungrateful topic; let us contemplate the Scotchman at home, spending his Sabbath after the primitive fashion, and surrounded with every incentive to devotion.

To one who has seen and felt the Scottish Sabbath, in its purity and simplicity, in the country, it is unnecessary to say a single word. You sleep for the night in some clean, comfortable, and airy house, amid the highly-cultivated fields, the trimly-kept hedges, the spreading beeches, and golden-tasseled laburnums of the earlier time, with here and there a dark pine, or a tall larch, rearing its cone of emerald high above the grove. The gentle rustle of the leaves at the turn of the current of the air from sea to land, and the murmur of "the brook that babbles by," lull you into a balmy and dreamless sleep, one hour of which is more refreshing than six hours of tumbling, "scared with dreams, and terrified with visions," in the murky atmosphere of a great city. There is a wonderful economy of time in these delightfully pure country atmospheres: you can rise with the lark, without any necessity of roosting with the raven. The cheering breath of morn awakens you, refreshed to the utmost of your heart's desire, and the water, drawn from the living fountain in the rock, braces you with additional vigour.

Forth you fare. A few dappled clouds have collected around the point of sunrise, among which the refracted beams are playing at rainbows. Well, the rainbow before the falling cloud never brought foul weather yet; so speed you to the upland, and if you take that bible with you, which was by purposed mistake left on your toilette, you will not want company.

Many are up before you, early as you are, but all is stilly and serene; the gentle breeze and the gurgling waters, which left you in repose within nature's lullaby, are silent, and you speed to the upland. How one steps out in such places: the heart is calm, but the blood dances, and the nerves are like the strings of a harp, tuned for sacred melody. The God of the Sabbath has blessed the Sabbath; and his blessing

runs full and free to all his creatures, rational and irrational, animate and inanimate.

You have gained the height, and the sun is up; but never mind,—you should see the rising sun from the hill on another morning—a week of the stranger is welcome here. Sit down, you have the book; and when you have drunk the water of life at the well-spring from on high, yonder is a bed of wild thyme, softer and more fragrant than any cushion that ever was prepared and perfumed for queens in a chapel-royal. There is One to hear, to answer, and to accept; fail not, therefore, to bow the knee to the God of nature and of grace in this his own temple, for he "heareth in secret, and rewardeth openly." Calm meditation, on the airy height, in the early morning, when the works of God are displayed wide around us in all their beauty, is far from being the worst preparation for a Sabbath according to the Gospel; so do not hurry, but let the feelings of the mortal body be tuned into harmony with the breathings of the immortal spirit.

You are wound up to your bent, and eager to join the congregation of them who seek the Zion of their God, with their faces thitherward. Well, the desire is commendable; but the time has not yet arrived; many have to come from a long distance, and they must not be disappointed. Take the circuitous path back to the home of your balmy repose for the night—a Sabbath morning's breakfast awaits you there. Pass in front of these straw and heath-clad cottages, which hang on the brow of the hill; there is a stilly repose about them, which suits the simplicity of the place and the sacredness of the morning. Hark! a low and murmuring sound; it is a father reading the sacred volume to his family, as the first portion of his simple and unaffected family worship on the Sabbath morning. A louder and more modulated sound breaks from the next simple cottage. It is the hymn of praise; and though in the ears of the fastidious the music may be false, the hearts are true. Another, and a more deep and solemn strain! In that humble cottage the father of a promising family is on his knees; and the family, some of them come miles to enjoy the father's instruction for the sacred day, are on their knees around. You hear the earnestness of his wrestling—"I will not let thee go, unless thou bless me;" and blessed of "the Angel of the covenant" be he who thus labours to bring up his family in religion and virtue. You linger and linger, for one or other of these sounds, finely adapted to the morning of the day, issues from every cottage of the long-protracted file.

At last you leave the cottages, and descend into the little glen which winds far among the hills, and shows a passage for the upland people to come down and worship God in his own temple. There is a mumbling voice from that haze!

copse, one word of which you cannot understand. A highland family are there ; they have travelled on foot since midnight, and ere they touch that very simple meal which they have brought with them, they must pour out the overflowings of their hearts at the footstool of the eternal throne, "All around the earth's wide girdle find me a willing worshipper, and I will find a fitting altar :"—

Pene me pigris, ubi nulla campis.

But leave them ; you cannot understand one word of what they say ; and they have gone into the copse in order to be alone with their God.

Down through the weeping birches, outdoing in sweetness all the perfumes of "Araby the blest," and cross the brawling torrent on the rounded blocks of granite—sienite it happens to be ; but *n'importe*, this is not the time nor the place for disputing about geology ; there are

two or three buxom lasses who, having come barefoot over the hill, are bathing their feet in the dancing crystal, ere they put on their stockings and shoes. They heed not you, so heed not them ; perfect innocence is a jewel more worthy the caskets of kings than all that Golconda ever boasted.

You at last gain the plain, and all is repose—the very cattle feel the repose, and the birds sing more softly. Truly it is the morning of the sabbath. At last you reach the home where you reposed. The "big ha' bible" is on the parlour table ; all the servants are called in ; and the worship of God is devoutly paid. It is not, however, the cold solemnity of the ascetic. It is the uplifting of the heart full of hope, and adds to the cheerfulness of the whole household. Then the free, full, and welcome breakfast comes, and you accompany the family to the parish church.

THE AMERICAN SLAVE.

WRITTEN BY THE REV. CHARLES FITCH, OF BOSTON, UNITED STATES.

THE following facts were related in my hearing by a man of colour from one of the southern states. This man has by some means purchased his own freedom and that of his wife ; but his children, several of them, have been taken away from him and sold, he knows not where. He proves himself, to the satisfaction of all who have intercourse with him, to be an humble disciple of Christ. I will give the facts, as nearly as possible, in his own words :—

"I had a little boy about eleven years old. One night as he came home he said to me, 'Father, the constable has been measuring me to-day.' 'Measuring you !' said I, 'what does that mean ?' 'Don't know,' said he ; 'he measured me about my body, and then he measured how high I was. I am afraid, father, they are going to sell me.' I tried," said the poor father, "not to think of it ; but the next morning, soon after I went to my work, a little boy came running up to me, crying out, 'John is gone, yonder they are taking him off now.' I went after them, and when I came near, my dear babe reached out his hands to me, and said, 'Father, I'm gone ; can't you do something for me ?' At this the man who was taking him away gave him a kick, and kicked him along the road ; and I have not seen my dear child, or heard of him, from that day to this. I could do nothing to help him ; it hurts me to think of it." Here he wept. Never in my life has my heart been so agonized at any deed of man, as when I heard this grey-headed father give this simple relation. "I had a daughter also," said the poor old man, "who was married, and had one child. One day a carriage drove up to the door, and took her in with her child, and carried them on board a vessel then

lying at the wharf, about to sail. As soon as I heard of it, I went after them. When I went to go on board they pushed me back ; but some one standing by said, 'That's too bad ; let the old man see his daughter.' I then went on board, and my poor child threw her arms about my neck, and said, 'Father, I'm gone.' Here the old man's sobs prevented his utterance ; but he recovered himself sufficiently to say, "I have not seen or heard of my child since. Her husband heard of it, and went to the vessel ; but they drew a dirk upon him, and would not allow him to go aboard. O !" said the old man, as the tears streamed from his eyes, "it hurts me every time I think of it." Probably it would hurt a slaveholder to suffer such wrongs ; and the best of them could be no more injured by them than this poor disciple of Christ. This man has, if I recollect right, six children sold into hopeless servitude, he knows not where. Three remained with him ; and these, some months ago, were bought up by a notorious firm of slave-dealers, and shipped for the southern market. Here the old man felt that he had lost his all ; and the distress of his wife, "who wept," to use his language, "as though her heart would burst," drove him, with great reluctance, after endeavouring to put his trust in God, to state his case to some pious friends, and ask if something could not be done for him. A minister of the Gospel, who was affected to tears at the old man's recital, went to the slave-dealers and interceded for him. They at length consented, that if the poor father himself could raise the money in one week, amounting to considerably more than two thousand dollars, he might have his own children, that is, the ones last taken away. Perhaps they

considered the question settled, as they would consent to no other conditions, and regarded it as impossible for the father to do as they proposed. He lifted his cries to God, however, and they were heard, and friends raised up, who gave him some few hundred dollars, and at length made him a loan of what remained, amounting

to eighteen hundred, on condition that it should be repaid in two years. If, at that time, it remains unpaid, the children are to be sold to pay it. The poor father is now, with much diffidence, and great embarrassment, stating his case to the pious and benevolent, and asking their aid, that his children may not again be sold into bondage.

"ME ARE SEVEN."

A DOMESTIC STORY.

ARE you a parent? Have you a heart? Then you have been a thousand times delighted with the inimitable blunders of children, and you will be well pleased with a scrap of domestic history.

Papa and mamma were seated at the breakfast-table, with their several olive-branches, and with one or two friends on a visit, when divers questions arose adapted to little folks. Among other inquiries their respective ages came into consideration.

"Pray, master James," said the visiter, "and how old are you?"

"Fourteen, ma'am."

"And you, William?"

"Twelve."

Upon this a discussion arose between the two younger boys.

"I am six," exclaimed George with eagerness. To which the last-born added, with a droll and significant nod of the head, "Me are seven."

"No, dear," replied George, "you are only three."

"Yes, me *are*, me *are* seven," rejoined the undaunted Harry; and to have seen the ardour, the insistence, the pertinacity, and the oratorical motion, they were admirable.

"Come, tell seven, my man," said the visiter.

"One, two, five, seven."

"Bravo!" *ridet omnes*.

These childish inaccuracies spread a charm over domestic conversation; and I have often felt that I would not, for the world, have little Harry talk otherwise than like a child; it would be a David in Saul's armour. And I would as soon hear a fine gentleman speak vulgarly, or add the aspirates where they should be omitted, or omit them where they should be given, all which are detestable things in the intercourse of life. It may be an error or a weakness, but I must candidly confess, that I have almost regretted the arrival of the period when my pretty little false grammarians pass beyond the enchanted boundaries of infant peccadilloes in language and sentiment into the regions of enlarging knowledge and juvenile maturity. Not that I do not in my heart desire the improvement of my offspring; not that I do not watch with interest, and cherish with a growing pleasure, the

germinations of thought, the general expansion of the intellect, and the accumulations of knowledge; but one naturally regrets to part with an amusement, especially when it is so pre-eminently innocent. If any person should philosophically object to this, and say that by laughing at errors we encourage a wrong principle, the simple, self-satisfying answer is, that the errors are in themselves insignificant, they involve no moral delinquency, and are sure to be corrected.

It might be curious, and not uninteresting, to analyze the source of that gratification which we feel in the ridiculous mistakes of children, especially of our own. Is it not possible that there may be existing in the mind some ideal comparison or measure of ourselves with the interesting dwarfs of the coming generation, originating a degree of self-complacency at our own superior knowledge and attainments? If, as some one declared, he could never feel indifferent even to the praises of a child, may not an analogous feeling awaken a conscious delight, when our own greatness, of whatever kind, is brought into juxtaposition with an infant's littleness? Even corporeal greatness, much more mental, even though it imply no merit, and be merely in the order of nature, excites self-gratulation; so that, as the giant looks down upon the admiring man, the man looks down upon the child. May there not also be some ideal comparison of the present little amusing blunderer with the future man of talent, cultivation, and influence? And may not the kindling eye, especially of the parent, all the time of the utterance of his pretty nonsenses, be glancing along the line of future progress to the point of imagined or predestined eminence? He sees, as it were, the first germinations of mind, the earliest unfoldings of intellect, and prognosticates the rich and varied harvest. In the delightful and entertaining prattler he sees in embryo, and with a parent's fond calculations, the accomplished scholar, the clever advocate, the learned judge, the skilful physician, or the celebrated divine; or he may trace in its elements the poet's fancy, the historian's research, or the orator's mighty magic. There is, moreover, a lurking humour in the very phraseology itself, which is the more agreeable, as, whatever interest it may excite, the applause given inter-

fers in no degree with our personal distinction and celebrity. The happiest hits, or the merriest combination of infant wit, or the drollest humour by mistake, or, when somewhat more advanced, by design, cannot awaken envy; so that we gain much of pleasure, and lose nothing of honour, by our admiration.

But when my prattling boy said, in the very best grammar he could command, "Me are seven," I was soon led into other and more serious reflections; and perhaps was not wrong in thinking that there was an incipient something to be watched over. It is impossible to ascertain how early the germ of sentiment may be formed and begin to evolve, or when education, properly speaking, may or should commence. The language in question surely betrayed a moral indication worthy of being cherished or repressed, which, like an oozing drop from the rock, might be the commencement of a wide and far-rolling river. Here was at least ambition; but of what kind? The brother of the little mannikin had uttered too much for Harry's self-complacency. If his elder were six, he must be seven; just as a few moments before, when the comparison respected height, he must be taller: "yes, pa, tall chair, taller;" that is, tall as the chair and taller. How his eye brightened, and his little heart beat at the thought! And mark how the company, then inattentive to his eloquence, were to be dinned into observation. In vain said mamma, "There, Harry, be quiet, my boy." Harry thought

"the world was made for Cæsar," and therefore was determined that, by repetitions of "taller—tall—high—up," it should admire how he had passed the Rubicon of his exploits.

Most minds are conscious (and may not this be traceable to infant education?) of the ambition to excel, which may have in it a very trifling quantum of the better passion of an ambition of excellence. The former is emulation; the latter, virtue. The desire to excel may, indeed, be a good or a bad feeling, according to circumstances; it may be blended with, or perhaps wholly consist of, a wish to disparage and degrade others, to throw them into the shade, and establish a proud claim to superiority. It may, in consequence, lead, in the end, to the perpetration of many vices, and become a permanent and unsightly trait of character. In this view it is mere ambition, and an offshoot of selfishness; its growth in the mind is therefore dangerous, and if it cannot be wholly extinguished, its deleterious and destructive effects should be neutralized, as poison is mingled in medicine with other ingredients, by infusing the elements of a right morality, that it may work good instead of evil. The ambition of excellence is a pure and elevated sentiment, tending to the attainment of it, and salutary in all its varieties and ramifications; it cannot be too soon instilled, or too diligently cultivated, for an infant's mind is susceptible of a repressing look or an encouraging word. X.

THE ATONEMENT.

[The following remarkable passage on the necessity of an Atonement, argued from reason, is from the pen of the celebrated Adam Smith. In the early editions of his "Theory of Moral Sentiments," it formed the concluding paragraph of part ii., section 2. The doctor is said to have cancelled it at the suggestion of Mr. Hume; certainly it is not to be found in the editions of his works published since his death. We earnestly commend it to the careful attention of those who are disposed to scepticism on this great topic.]

THAT the Deity loves virtue and hates vice, as a voluptuous man loves riches and hates poverty, not for their own sakes, but for the effects which they tend to produce; that he loves the one, only because it promotes the happiness of society, which his benevolence prompts him to desire; and that he hates the other, only because it occasions the misery of mankind, which the same Divine quality renders the object of his aversion—is not the doctrine of untaught nature, but an artificial refinement of reason and philosophy. Our untaught natural sentiments all prompt us to believe, that as perfect virtue is supposed necessarily to appear to the Deity, as it does to us, for its own sake, and without any further view, the natural and proper object of love and reward, so must vice, of hatred and punishment.

That the gods neither resent nor hurt, was the general maxim of all the different sects of the ancient philosophy; and if by resenting be understood that violent and disorderly perturbation which often distracts and confounds the human breast, or if by hurting be understood the doing mischief wantonly, and without regard to propriety or justice, such weakness is undoubtedly unworthy of the Divine perfection; but if it be meant that vice does not appear to the Deity to be, for its own sake, the object of abhorrence and aversion, and what, for its own sake, it is fit and right should be punished, the truth of this maxim seems repugnant to some very natural feelings. If we consult our natural sentiments, we are even apt to fear lest, before the holiness of God, vice should appear to be more worthy of punishment than the weakness and imperfection of human virtue can ever seem to be of reward. Man, when about to appear before a Being of infinite perfection, can feel but little confidence in his own merit, or in the imperfect propriety of his own conduct. In the presence of his fellow-creatures he may, even justly, elevate himself, and may often have reason to think highly of his own character and conduct, compared to the still

greater imperfection of theirs; but the case is quite different when about to appear before his infinite Creator: to such a Being he fears that his littleness and weakness can scarce ever appear the proper object of esteem or of reward. But he can easily conceive how the numberless violations of duty of which he has been guilty should render him the proper object of aversion and punishment; and he thinks he can see no reason why the Divine indignation should not be let loose, without any restraint, upon so vile an insect as he himself must appear to be. If he would still hope for happiness, he suspects that he cannot demand it from the justice, but that he must entreat it from the mercy of God. Repentance, sorrow, humiliation, contrition at the thought of past conduct, seem, upon this account, the sentiments which become him, and to be the only means which he has left for appeasing that

wrath which he knows he has justly provoked. He even distrusts the efficacy of all these, and naturally fears lest the wisdom of God should not, like the weakness of man, be prevailed upon to spare the crime by the most importunate lamentations of the criminal. Some other intercession, some other sacrifice, some other atonement, he imagines, must be made for him beyond what he himself is capable of making, before the purity of the Divine justice can be reconciled to his manifold offences. The doctrines of revelation coincide in every respect with these original anticipations of nature; and as they teach us how little we can depend upon the imperfection of our own virtue, so they show us, at the same time, that the most powerful intercession has been made, and that the most dreadful atonement has been paid for our manifold transgressions and iniquities.

CHARADE.

[A well-written charade is about as harmless a sort of thing as any one may write, when he is in the mood for so doing: withal it exercises the imagination, fancy, and memory, in a manner proportioned to its peculiar and complex construction; and when dictated by a warm heart and spirit—a generous temper, and a ready memory, and quiet wit, it may be rendered both instructive and amusing—results which are among the most gratifying to us all. The following charade may be somewhat long, but is not the worse for that reason.]

PRONOUNCED as one letter, and written with three,
Two letters there are, and two only, in me.
I am double, am single, am black, blue, and grey;
I read from both ends, and the same either way.
I am restless and wandering, am steady and fixed,
And you know not one hour what I may be the next.
I melt and I kindle, beseech and defy,
I am watery and moist, I am fiery and dry.
I am scornful and scowling, compassionate, meek;
I am light, I am dark, I am strong, I am weak.
I am sluggish and dead, I am lively and bright,
I am sharp, I am flat, I am left, I am right;
I am piercing and clear, I am heavy and dull,
Expressive and languid, contracted and full.
I am careless and vacant, I search and I pry,
And judge, and decide, and examine, and try.
I'm a globe, and a mirror, a window, and door,
An index, an organ, and fifty things more.
I belong to all animals under the sun,
And to those which were long understood to have none.

By some I am said to exist in the mind,
And am found in potatoes, and needles, and wind:
Three jackets I own, of glass, water, and horn,
And I wore them all three on the day I was born.
I am covered quite snug, have a lid and a fringe;
Yet I move every day on invisible hinge.
A pupil I have, a most whimsical wight,
Who is little by day, and grows big in the night,
Whom I cherish with care as a part of myself;
For in truth I depend on this delicate elf,

Who collects all my food, and with wonderful knack
Throws it into a net which I keep at my back;
And though heels over head it arrives in a trice,
It is sent up to *table* all proper and nice.
I am spoken of sometimes as if I were glass,
But then it is false, and the trick will not pass.
A blow makes me *run*, though I have not a limb;
Though I neither have fins nor a bladder I *swim*.
Like many more couples, my partner and I
At times will look cross at each other or shy:
Yet still, though we differ in what we're about,
One will do all the work when the other is *out*.
I am least apt to cry, as they always remark,
When trimmed with good lashes, or kept in the dark.
Should I fret and be heated they put me to bed,
And leave me to cool upon water and bread.
But if hardened I grow they make use of the knife,
Lest an obstinate humour endanger my life.
Or you may, though the treatment appears to be
rough,
Run a spit through my side, and with safety enough.
Like boys who are fond of the fruit and their play,
I am seen with my ball and my apple all day.
My belt is a rainbow; I reel and I dance;
I am said to retire, but I never advance.
I am read by physicians, as one of their books,
And am used by the ladies to fasten their books.
My language is plain, though it cannot be heard,
And I speak without ever pronouncing a word.
Some call me a diamond, some say I am jet;
Others talk of my *water*, or how I am *set*.
I'm a borough in England, in Scotland a stream,
And an isle of his sea in the Irishman's dream.
The earth without me would no loveliness wear;
The sun, moon, and stars at my wink disappear.
Yet so frail is my tenure, so brittle my joy,
That a speck gives me pain, and a drop can destroy.

The solution of this problematical charade will be clearly seen by all who have an *eye*.

REVIEW.

Memoirs and Select Remains of the Rev. Thomas Rawson Taylor, late Classical Tutor at Airedale College, Yorkshire. By W. S. MATTHEWS; London.

How many harps have caught their tones from that of the youthful White! and how many hearts have been sweetly saddened by the melodious outpourings of his! It was fabled of the nightingale, that she sang with her bosom against a thorn. With regard to poets this is no fable; their history is usually a history of mental suffering. Not, perhaps, that the ordinary calamities and trials of life fall peculiarly to their lot, but that, having their share of these, acute feelings and a vivid temperament hurry them into difficulties which the more prudent and calculating qualities of their neighbours would have avoided; and, also, that their keen sensibilities cause them to writhe with agony beneath infictions which would pass like a summer cloud over the minds and hearts of the million. The feelings of the true poet are like the strings of an *Æolian harp*—the lightest breath causes them to vibrate, while the hearts of his more literal neighbours are cased as in the hide of the hippopotamus. White died early, and thereby, probably, escaped much of misery and mortification; for his was a spirit not formed to stem the current of this elbowing, huxtering, wrangling, over-reaching, Cocker-studying world. His melodious expression of his sorrows, and his early subjection to our indigenous disease, will always excite sympathy, as they always have done. In our boyhood we remember his "Remains" were our walking and pillow companion; indeed, we had become considerably attenuated, had contracted moreover a slight hectic and a short hard cough; we chose night as the season for walking, and rambled in the most lonely spots we could find by the light of the moon, to whom, as in duty bound, we addressed sundry sonnets. At length we began to persuade ourselves that we bore much resemblance to poor Henry, but never completed that resemblance, either by growing consumptive or writing verses equal to his.

If the writings of Henry Kirke White have never moulded a great poet, they have yet caused the production of many sweet and elegant poems, refined many hearts, and purified many tastes. He has not, like Byron, generated sceptics, sneerers, and mystifiers; nor, like Moore, jesters and demireps; but he has fostered amiable feelings, and, through the medium of sweet and lofty verse, instilled into the youthful minds of thousands a love of piety, virtue, and literature. The mind of Mr. Taylor appears in early youth to have been much influenced and modelled by the writings of the bard of Nottingham, an influence which his subsequent residence in that city could not fail to strengthen. He was born, it appears, at Ossett, in Yorkshire, in May, 1807, and was the son of the Rev. T. Taylor, of Bradford. At the grammar-school there he was placed at the age of seven years, and at a later period with the Rev. Dr. Clunie, in the neighbourhood of Manchester. At this period his poetical genius first displayed itself in satire; a form in which it was likely to be called forth just in proportion as his feelings were amiable, generous, and susceptible. They are not the ill-natured men who are masters of satire. The ill-natured man may traduce, backbite, defame, abuse, but he cannot satirize; although the satirist may, by the habitual exercise of his powers, become ill-natured. The man of warm, generous impulses, and lofty aspirations, is he who is usually stung into satire. He has, perhaps, trusted implicitly, and been basely betrayed; loved fervently, and met with

coldness or with scorn; acted generously, and received in payment heartless ingratitude; opened the recesses of his heart confidingly, and been misunderstood, misrepresented, and calumniated. Intense bitterness of spirit is the result; and the qualities which unconsciously invoked injury become their own powerful avengers, as the waters which, in their calm and ordinary course, confer beauty and fertility, spread around them, when wrought by outward action into convulsive energy, destruction and ruin. But this is a digression. In 1822 Mr. Taylor was placed in a counting-house, at Bradford; and in 1824 apprenticed to Mr. Dunn, printer and bookseller, at Nottingham, but subsequently undertook the ministry, and became classical tutor at Airedale College, Yorkshire. He died of consumption, in March, 1835.

The letters in this volume breathe an affectionate and pious spirit, but they do not indicate great powers of mind, nor originality of thought. As a favourable specimen of his prose compositions we select a paper on boyish days; a subject which has often before elicited the raptures of poets and prosers. "Ah, once again, who would not be a boy?" wrote Byron. For one, we would not; for we believe that we were not then happier than we now are, although in looking back we are apt to fancy that we were so. The trials of the man, it may be said, are heavier and more severe than those of the boy. Granted; but might not the trials of the boy have been to the boy as severe as subsequent ones are to the man? In our own case we think they were so. Man, however, exists but in the past and the future; the present is a moment which before we can say it is here is gone. He sees a vague and purely imaginative happiness in his future years; and looks back upon a happiness less vague, but scarcely less imaginative, in his past. The whole weight and severity of his present grievances are *felt*, while those of his past are diminished and almost lost in the distance. He is like a traveller who pauses in his journey to look back on the path by which he came. The ruggedness and difficulties of the road just traversed stand palpably in view, while the distant prospect appears softened to a smooth and verdant level. This is our theory. The following is Mr. Taylor's more delightful and poetical one:—

OUR SCHOOL-DAYS.

"We all love to think and speak of our school-days; wearied with the dull, monotonous realities of the present, and suspicious of the flattering promises of the future, we turn with calm satisfaction and delighted confidence to the past.

"The path of life is all up hill; and it is a pleasant thing to pause on our journey, and look back from the point of vantage which we have gained in progress of years, upon the road we have travelled, to survey its sinuous mazes, its perplexing intricacies, its dreary wastes, which we have so happily overpassed, its smiling Edens, which we can thus revisit and re-enjoy. And the remoter parts of that landscape are always most transcendently lovely in our eyes; a more beautiful heaven seems to overhang them, a softer and more melting sunshine to brood upon them; the trees are greener and more richly umbrageous; the flowers, (for memory's far-seeing eye can distinguish even the celandines, and daisies, and forget-me-nots at the distance of forty years,) the flowers are more gaily apparelled and more tastefully grouped, and there are far more of them.

"Over hill and valley, wood and waterfall, meadow and moorland, there are flung 'a glory and a joy' which have passed away like summer mists from the nearer landscape.

"Heaven lies about us in our infancy, and throughout all our early days we are surrounded by influences and pervaded by emotions which, in more mature life, we may remember, but cannot recal. When once we have ceased to be children, we have lost the power to think and feel 'as only childhood can.' We have become sophisticated, cold-hearted, suspicious; we are too wise, too cautious, too incredulous; we will not submit to be cheated into enjoyment, and take the benefit of a happy error. 'The world is too much with us,' the solid, substantial, matter-of-fact world, in which grown-up men and women slave at the dolorous drudgery of money-getting; and our senses, and facul-

ties, and susceptibilities have suffered injury from the tainted atmosphere in which we live. Where are now the marvels and glories which met our earnest gaze every where, in heaven and earth, when we were six, or eight, or ten years old? We search for them in vain; there is a film upon our eyes; we are short-sighted beyond the power of surgery or optics to cure us; and the sounds which then rang in our ears, awaking the sense of divinest melody in our souls, and wrapping us in thrilling trance from morn to night, where be they? The song of birds, the hum of bees, the flute-notes of summer's winds, the soothing murmurs of the running brooks, the mysterious whispers of autumnal woods, are they all silent? Not one is mute, but, alas! they fall upon deaf ears. Nature still 'pipes to us, but we will not dance;' and what was once 'most musical' is now, to our altered spirits, sometimes 'most melancholy.' And we can never recover what we have lost, or be again assimilated to our former selves; we can only remember what was then experienced. The 'formal man' can realize the careless joyance and light-heartedness of days which are long since past in no other way than by contemplating, in memory's magic glass, what and in what manner, and with what emotions, he saw, and heard, and spake, and acted, 'when he was a tiny boy.'

"Hence we all love to think and speak of our childhood and early youth, and especially of our school-days, because they are, for the most part, the commencement of our juvenile reminiscences. We can go no further back, and because, in all cases, it is from that period that all our recollections become distinct in their particulars, and interesting in their associations.

"We can remember many grave lectures of parents and pedagogues, to the effect that school-days are the happiest part of man's life, and that we should find them so. Then did we not believe a word of it, the thing appeared to us a plain contradiction: long lessons and short play-hours, dreary pages of geography and English grammar, and *propria que maribus*, with all the fears and anxieties, the pains and penalties, of our pupillage, were, in our estimation, any thing but elements of happiness or incentives to enjoyment; and besides, 'hope told a flattering tale,' and we looked forward to the time when we should leave school and be our own masters, with no dry tasks to learn, and no tiresome bounds to keep, and no frowns or flagellation to fear, as our jubilee,—the period of complete emancipation from all trouble and annoyance, when we should pass at once into a state of perfect, uninterrupted, and interminable bliss. Alas! we have seen 'hope's summer visions die;' we have been in the school of experience, and disappointment has taught us many a sad and sobering lesson. We have cut Campbell for Rogers; we have read through the 'Pleasures of Hope,' and have got into the pages of 'The Pleasures of Memory.' And now (is it not your experience, gentle reader, as well as ours?) even the little sorrows of our early days are dwelt upon with feelings near akin to pleasure. That ancient school-house, (we thought it a dungeon once,) what a pleasant place it looks! And of what gentle restraints, and easy labour, and innocent mirth was it the scene! And its presiding genius, with the awful spectacles, and still more awful 'rod for the fool's back,' whom we once regarded as an apt prototype of all the ogres and giants in our delightful story-books—what a kind good old man he was! How much more 'sinned against than sinning!' With what loud and hearty praise did he reward our smallest merits! With what surpassing patience did he endure our intolerable and endless provocations! Peace to his gentle shade!

"How pleasant it is to send our fancy on a pilgrimage to all our school-day haunts!—the walk across the meadows, and down by the brook side, and over the crazy bridge by the mill, and back again through the shady lane, where we gathered sweet violets:—the Vicar's copse, where blackberries were as plentiful as pebble stones—and the hazel-wood, to which we once a year went a nutting; and, above all, the old play-ground, with its smooth turf and weeping birches, (bless the tender-hearted trees for their sympathy!) which would have been a jewel of a place for all our games if it only had been out of bounds! Oh, those merry games! the boisterous sports of our short play-hours; the riotous rambles and madcap frolics, and innocent mischiefs of our long half-holidays; the

'Quips, and cranks, and wanton wiles'

which made us every day, and every hour at once a plague and a delight to each other, and to all about us! And who were our companions in these glorious romps and rambles? The whole group is before us. Of all the 'old familiar faces' not one is absent—not one is changed. We can see them all clearly—we can distinguish them all accurately, as we did so many years ago when we were one of them. There they are from the oldest to the youngest; from the clever little rogue who taught us to make whistles, and to fish for minnows, and who so often made us an April-fool, to the grave melancholy boy who never once fought a battle, nor joined in the romp, nor went birds-nesting, but told us such marvellous and touching tales, in such eloquent words, as 'often did beguile us of our tears.' There they are! we could name them one by one without a single mistake; we could arrange them in their old classes, and seat them in their old desks; we could describe, with most exact minuteness, the qualities, bodily, intellectual, and moral, of every one of them; and, if we wrote ourselves R.A., we could paint their pictures to the life; so clearly and distinct are they present to our inward eye. And, hark! the air is vocal with their glee. Their merry voices ring in our ears; we can recognise every tone; we know to whom every short

belongs. Again we listen to their 'gibes, their songs, their flashes of merriment;' and again we hear their old nick-names and by-words, none of them unkindly meant or harshly spoken, but flowing from a frank familiarity and innocent open-heartedness, which knew nothing of formal propriety and forced politeness.

"Beloved companions! years have passed since we parted; but ye are our companions still. Ye have gone each to his appointed portion and station. We know not what or where you are—in what circumstances—of what character:—certain it is, that neither in body nor soul are ye the same as in former days. But no matter. We know you only as a troop of joyous children, who studied and sported—who read and romped—who laughed and wept with us when we too were a child. As such ye abide in our memory, and in our 'heart of hearts,' unchanged and unchangeable. And your simple society affords a precious solace and happy retreat to our troubled spirits, when we are weary of the heartless formalities and insincere professions of the world.

"For your sakes, then, we shall always love to think of our school-days, and, as far as retrospective fancy may enable us, to live them over again: and though the gay and thoughtless may eschew such musings as fantastic and melancholy, and though they must ever be attended with somewhat of pensive sadness and tender regret, yet will we often indulge them, and they shall employ our thoughts and engross our sensibilities, even in our choicest moods. If they should make us sigh sometimes, or even shed a tear, we are content. Not always would we dwell with—

'Sport that wrinkled Care derides,
And Laughter holding both his sides;'

but sometimes follow the silent steps of 'divinest Melancholy,' knowing as we do most surely, and feeling as we are daily constrained to feel, that—

'There is no music in the life
That sounds with idiot laughter solely;'

that—

'There's not a string attuned to Mirth,
But has its chord in Melancholy.'

The chief characteristic of the poems of Mr. Taylor is feeling. He appears at all times to have written from the dictation of his heart rather than of his head, as a poet should do. Perhaps feeling is the grand characteristic of modern poetry. If the last few years have produced no great epic or dramatic poem, how prodigal have they been of the most exquisite lyrics. Who can enumerate the Byrons, Campbells, Coleridges, Moores, and Hemanses, who have made this branch of the art second to none. Even the anonymous lyrics of the last thirty years throw the Shenstonian namby-pambies—the Strephons and Chlorises of former times into the densest shade, whence they are not likely, we think, to be recalled.

There is much pathos in the poem commencing at page 290, entitled, "Communion with the Dead." It is addressed to the author's deceased sister, Mary, to whom he appears to have been tenderly attached. If our limits would allow we should feel much pleasure in extracting it, but must content ourselves with the following less lengthy specimens:—

SONNET

WRITTEN IN WILFORD CHURCHYARD, A FAVOURITE HAUNT
OF HENRY KILKE WHITE.

"Here would the martyr-student oft retire,
And watch the shades of eve descending, till
Meek twilight robed the valley and the hill!
Then would he sweep his sad, melodious lyre,
And bid such music from the chords respire,
So melancholy, soft, and sad, and sweet,
As angel choirs might waken when they meet
Around the bed where holy men expire.
Henry! thy lyre is mute, thy song is sung,
And we may list thy plaintive notes no more;
But thou hast waked a happier strain, and strung
A sweeter harp upon a fairer shore.
O, martyr-minstrel! let thy mantle fall
On all who love the lyre,—on me, though least of all.

STANZAS.

I.

"Blooms there a rose without a thorn?
Go search creation round,
From morn to eve, from eve to morn,
There shall not one be found.

Sweet they may be, and fair, and bright,
 All life, and loveliness, and light;
 The leaves may be green as the mermaid's locks,
 When she wreathes them with shells on the coral rocks;
 And the beautiful flowers may far outvie
 The golden tints of the sunset sky;
 And far more fragrant their breath may be
 Than the spicy gales of Araby;
 But be they ever so bright and fair,
 There's many a thorn in ambush there.

II.

"And oft across the waste of life,
 The few frail joys that flee,
 Seem thus with fragrant beauty rife,
 From shade of sorrow free;
 And lighten all our gloomiest hours,
 Like such a rose among the flowers.
 But let their beauties be all forgot;
 Oh! think of the thorns, and touch them not,
 For the hand that plucks the fair false weed,
 Though it gain the flower, is sure to bleed.
 And they may be sweet and fair to night,
 But all is over by morning light;
 And withered and shed are the leaves so fair,
 And the roses are gone, but the thorns are there."

SONNET.

"It is a melancholy joy, at eve,
 To sit upon some woodland seat, and list
 The moaning of the brooklet, softly kiss'd
 By evening winds; and through the boughs that weave
 Their branches overhead, and gently leave
 Their flowers and leaves athwart the deep blue sky,
 To watch the pale moon as she travels by.
 Ah! sad remembrance!—she bids us grieve
 For those erewhile on whom she shone;—she shines
 As brightly now as then—upon their graves.
 For them no more this bower its cool shade twines,
 The tall dark grass in cheerless whisper waves,
 Where they are sleeping on their couch of clay:—
 A few more waning moons, and we shall be as they."

The foregoing are a fair sample of the poems contained in the volume, which are highly creditable to the author's talents, while they prove him to have possessed a tender, affectionate, and fervent spirit. There is one poem, "A Fragment," which, short as it is, proves that Mr. Taylor could write with power as well as sweetness. The "Fragment" reminds us, in some lines, of Pollok, and in others, of Byron's "Darkness."

MORSELS.

EARLY MISSIONS TO AFRICA.—It is well-known that the Church of Rome has always been zealous in the diffusion of her erroneous system of religion; but the means employed have been very frequently opposed to the spirit of Christianity. In the latter part of the sixteenth century some Portuguese Missionaries were sent to Africa, where, if the historians of that age are to be credited, they used violent methods to effect their purposes. When, for example, they could not persuade the people to renounce their superstitions, they used a large staff, with which they threw down their idols, and beat them in pieces; they even sometimes stole secretly into the temples and set them on fire. A Missionary at Maspongo, having met one of the queens, and finding her mind inaccessible to all his instructions, determined to use sharper remedies, and seizing a whip, began to apply it to her majesty's person. The effect he describes as most auspicious; every successive blow opened her eyes more and more to the truth, and she at length declared herself wholly unable to resist such forcible arguments in favour of the Catholic doctrine. She hastened to the king, however, with loud complaints respecting this mode of illumination, and the Missionaries thenceforth lost all favour, both with that prince and the ladies of his court, being allowed to remain solely through dread of the Portuguese.—*Edinburgh Cab. Library.*

DROWSY HEARERS.—In the early history of New England, it is stated in Lewis's History of Lynn, a person was deputed to wake the sleepers in church. He bore a long wand, on one end was a fox's tail, with which he gently touched the drowsy fair; but on the other end was a ball, with which he bestowed on the snoozers of the snoring men a startling rap.

OLD BOOK.—The first book ever printed at Valenciennes, and which is at the same time the oldest specimen of typography known in the north of France, has just arrived in France from England. It was at

one time sold in London for £6 8s., and at the sale of Bishop Heber's books it fetched £18. This curious book has the following title:—*S'ensuivent les Chansons Georgines faites par Georges Chastelain, (imprimées à Vallanchiennes de par Jehan de Liege, demorant devant le couvent de St. Pol.)* [No date, but the date is from 1499 to 1500.] These songs in old French are very interesting, as showing the state of poetry at the end of the 15th century. The price now asked for the book is 500 francs.—*Le Voleur.*

THE MONTHS.—December, which in the Anglo-Saxon ages stood first, was called *Mid-winter-Monath*, the mid-winter month. January was denominated *Aefter-Yula*, that is, after the feast called Yula, a Pagan, riotous, lawless festival, observed at the same time of the year as our Christmas, and hence the origin of the Yule-log, still selected in some parts of the country for the Christmas evening fire. February, they called *Sol-monath*, the sun month, from the return of the sun at that season. March, they called *Rhede*, or *Reth-monath*, the rough or rugged month. April's month was *Easter-monath*, from a favourite Saxon goddess, whose festival was kept at that time. May was *Trimilchi*, from the cows being then milked three times in the day. June's name was *Sere-monath*, the dry month. July was called *Mæd-monath*, the mead month, from the meads being then in their bloom and beauty, or the people being then employed in hay-making. August had the name of *Wood-monath*, the weed month, from the luxuriance or abundance of weeds at that time. September was called *Harfest-monath*, or the harvest month. October bore the name of *Winter-fylleth*, or winterfall, from winter approaching with the full moon of that month. November, their last month, they called *Blot-monath*, blood month, from the blood of the cattle then slain and stored for winter provision.

GEMS.

WOMAN.—Woman is a very nice and complicated machine. Her springs are infinitely delicate, and differ from those of a man as the work of a repeating watch does from that of a town-clock. Look at her body—how delicately formed! Examine her senses—how exquisite and nice! Observe her understanding—how subtle and acute! But look into her heart—

there is the watchwork, composed of parts so minute in themselves, and so wonderfully combined, that they must be seen by a microscopic eye to be clearly comprehended. The perception of woman is as quick as lightning. Her penetration is intuition—I had almost said instinct. By a glance of her eye she shall draw a deep and just conclusion. Ask her how she formed it,

she cannot answer the question. As the perception of woman is surprisingly quick, so their souls' imaginations are uncommonly susceptible. Few of them have culture enough to write; but when they do, how lively are their pictures! how animated their descriptions! But if few women write, they all talk; and every man may judge of them in this point, from every circle he goes into. Spirit in conversation depends entirely upon fancy, and women all over the world talk better than men. Have they a character to pourtray, or a figure to describe, they give but three traits of one or the other, and the character is known, or the figure placed before our eyes. Why? From the monument of susceptibility, their imaginations, their fancies, receive lively impressions from those traits, and they paint those impressions with the same vivacity with which they receive them. Get a woman of fancy warm in conversation, she shall produce a hundred charming images, among which there shall not be one indelicate or coarse. Warm a man on the same subject, he will probably find stronger allusions, but neither be so brilliant nor so chaste.—*Sherlock*.

VALUE OF CHARACTER.—Colonel Chartres, (who was the most notorious bad man in the world, and who had by all sorts of crimes amassed immense wealth,) sensible of the disadvantages of a bad character, was once heard to say, that "although he would not give one farthing for virtue, he would give ten thousand pounds for a character, because he should get a hundred thousand pounds by it." Is it possible, then, that an honest man can neglect what a wise rogue would purchase so dear?—*Lord Chesterfield*.

LIFE.—Oh, how many ties there are to bind the soul to earth! When the strongest are cut asunder,

and the spirit feels cast loose from every bond which connects it with mortality, how imperceptibly does one little tendril after another become entwined about it, and draw it back with gentle violence! He who thinks he has but one love is always mistaken. The heart may have one overmastering affection, more powerful than all the rest, which, like the main root of the tree, is that which supports it; but if that be cut away, it will find a thousand minute fibres still clinging to the soil of humanity. An absorbing passion may fill up the soul, and, while it lasts, may throw a shade over the various obligations and the infinite multitude of kindnesses and tender associations that bind us to mankind; but when that fades, these are seen to twinkle in the firmament of life, as the stars shine after the sun has gone down. Even the brute, and the lilies of the field, that neither toil nor spin, put in their silent claims; and the heart that would have spurned the world settles quietly down again upon its bosom.

THE GOAL OF SCIENCE.—See only in what contemplations the wisest of men end their most sublime inquiries! Mark where it is that a Newton finally reposes, after piercing the thickest veil that envelopes nature—grasping and arresting in their course the most subtle of her elements and the swiftest—traversing the regions of boundless space—exploring worlds beyond the solar way—giving out the law which binds the universe in eternal order! He rests, as by an inevitable necessity, upon the contemplation of the Great First Cause, and holds it his highest glory to have made the evidence of his existence, and the dispensations of his power and of his wisdom, better understood by men.—*Lord Brougham*.

SAYINGS AND DOINGS.

THE FATHER OF THE FOLEYS.—Is it not of the nature of all things human to deteriorate? Perhaps it is, when unchecked and unmodified by circumstances. We have seen the founder of a great name toil up the ascent with unwearied and continued exertion, and deserving the eminence which he gained and transmitted to his posterity. Again we have also seen that posterity descend as rapidly as their father rose, possessing the patrimony but dishonouring the virtue that bequeathed it. So likewise it has sometimes happened, that a nobility founded on baseness the most abject, and profligacy the most revolting, has been purified and exalted to true greatness by the virtuous scions that have sprung out of it, heaven knows how. What the Foleys now are or have been, we know not, and shall not trouble ourselves to inquire; we are sure, however, that they have no need to be ashamed of him who laid the foundation of their house, as the following brief narrative will certify:—"The most extraordinary and the best-attested instance of enthusiasm existing in conjunction with perseverance, is related of the founder of the Foley family. This man, who was a fiddler living near Stourbridge, was often witness of the immense labour and loss of time caused by dividing the rods of iron, necessary in the process of making nails. The discovery of the process called 'splitting,' in works called 'splitting-mills,' was first made in Sweden, and the consequences of this advance in art were most disastrous to the manufacturers of iron about Stourbridge. Foley, the fiddler, was shortly missed from his accustomed rounds, and was not again seen for many years. He had mentally resolved to ascertain by what means the process of splitting of bars of iron was accomplished; and, without communicating his intention to a single human being, he proceeded to Hull, and thence, without funds, worked his passage to the Swedish iron port. Arrived in Sweden, he begged and

fiddled his way to the iron founderies, where, after a time, he became a universal favourite with the workmen; and from the apparent entire absence of intelligence or any thing like ultimate object, he was received into the works, to every part of which he had access. He took the advantage thus offered, and having stored his memory with observations, and all the combinations, he disappeared from amongst his kind friends as he had appeared, no one knew whence or whither. On his return to England, he communicated his voyage and its results to Mr. Knight, and another person in the neighbourhood with whom he was associated, and by whom the necessary buildings were erected, and machinery provided. When at length every thing was prepared, it was found that the machinery would not act; at all events, it did not answer the sole end of its erection,—it would not split the bar of iron. Foley disappeared again, and it was concluded that shame and mortification at his failure had driven him away for ever. Not so; again, though somewhat more speedily, he found his way to the Swedish iron works, where he was received most joyfully; and to make sure of their fiddler, he was lodged in the splitting-mill itself. Here was the very end and aim of his life attained beyond his utmost hope. He examined the works, and very soon discovered the cause of his failure. He now made drawings, or rude tracings; and having abided an ample time to verify his observations, and to impress them clearly and vividly on his mind, he made his way to the port, and once more returned to England. This time he was completely successful, and by the result of his experience enriched himself, and greatly benefited his countrymen. This we hold to be the most extraordinary instance of persevering self-devotement in modern times."

STORY OF A LEAF.

ARTICLE THE SECOND.

THE ancient fable tells us that the *leaves* of the sibyl always became the more valuable, or—which comes to the same thing “on ‘change”—she always asked the higher a price for them the lower she reduced their number. The moral of this fable “tells home :”—the sibyl’s leaves are the days of human life ; and those who are ignorant, unprepared, and yet near the brink of the grave, can tell, from the bitter recollection of the number they wasted in early life, the great value of even a few days.

“Ward’s Miscellany” will be the very antipodes of the sibyl’s leaves, except to those who, like the idler in youth, neglect to procure and profit by the early numbers ; for while the numbers go on increasing in an arithmetical ratio by the addition of eight leaves every week, the value cannot fail to go on in the geometrical ratio of a continual multiplication by eight. I shall say nothing about the quality ; but the quantity of what I could say about *my leaves*—even though the first was a withered leaf in autumn, and the last of the season upon its tree—threatens me with the geometrical progression. The intelligent readers of the Miscellany—and they must, as matter of course, become intelligent, whatever they may have been *before they began to read*—the readers of the Miscellany must, for these many days, go to the rest for fruit, for they can get nothing but leaves from me.

Even this is part of the “story of a leaf,” and a fruit to which growers of both leaves and fruit pay very great attention. If they wish to have numerous and valuable leaves, there must be no flowering and fruiting ; and if they wish to have fine flowers, and choice and abundant fruit, they must beware of having too many leaves.

There is a useful scrap of moral here too ; indeed there is a moral in every thing, as, for instance, a mouse, or the mustachio of a fop, if folks would note it. [Note it in the last instance : were it not for the mustachio, folks would be apt to *miss*-name the creature.] That is a “make-weight moral,” given to the reader for luck ; and now for the proper one. Plant, beast, or man, always does best by doing one thing at a time. The parson’s wife used, indeed, to boast that she could scold the housemaid, direct the cook, and judge of the rehearsal of the sermon, very perfectly, and all at the same instant. The parson hinted, however, when she was out of the way, that the intonation against Betty was always more sonorous, the dinner more savoury, and the beauties of the sermon more full and fine, when the three duties of his better half were performed *seriatim*, with rests between.

After we know what a leaf is, our next inquiries naturally are, what it is like, and what it is

good for, that is, what purpose it serves in nature ; for in art it may be food, clothing, physic, poison, and one knows not what. A leaf, then, separates from the plant producing it, is dead instantly after, if not before this, and never has the least tendency to produce a plant like that upon which it grew, or any part of the same or any other plant, though it may be, and generally is, useful to some plant or other as manure.

Leaves often consist of two distinct parts,—a petiole or footstalk, and a blade or expansion ; but some leaves have no apparent footstalk, and are called *sessile*, because the base of the blade, as it were, *sits* upon the member bearing the leaf ; and there are other instances in which the base of the leaf sheathes or embraces the stem or twig in whole or in part. These, however, are fully as often mere fronds, or green expansions, rather than leaves. It is sometimes said that trees with sessile leaves make better timber than those which have long footstalks. This may be true in the species of any other genus, but it is not true in different genera, even of the same family. The leaves of the *araucarias*, or pines, of the southern hemisphere, are much more sessile than those of the pines of the north, but the timber is of very inferior quality.

There are many cases in which it is not easy, from mere inspection, to say whether a blade or broad expansion upon a plant is a leaf or a frond. A very little dissection, and the help of a moderately good glass, may soon settle the matter, however. In a true leaf there is always an articulation of one distinct part upon another ; however firm the union may be, as long as the function of the leaf is required, and however the vessels of the one may appear to have a temporary connexion with those of the other, there is always the rudiment of a *decidua*—“something that can part,”—existing between the vessels ; and when the function of the leaf is performed, the *decidua* contracts the vessels, and cuts off the communication ; and when it has done this completely, it parts, and the leaf tumbles to the ground. Thus, for instance, a beech, if a young or low-growing one, in a very cold and bleak situation, will keep its brown and withered leaves the whole winter, in spite of the frost and the wind ; and were it not for the well-formed buds and the healthy bark, one would be apt to pronounce the tree dead. On the other hand, a mulberry-tree shall—on some of those warm but treacherous “halcyon” days pretty early in autumn, when not a wind stirs, and the stubbles are literally carpeted with little cobwebs—he standing in all the solemn majesty of its dark foliage, with scarcely a leaf altered from the full colour of the summer ; in the night the frost shall pinch, and

H

the hoar-frost whiten every blade ; and then, if the sun comes out but in the forenoon, down will come all the leaves of the mulberry, in the course of an hour or two, all completely peeled off, and many retaining their greenness after their fall. The *membrana decidua* must do its work very expeditiously in these cases, and this without any of that gradual decay and change of colour in the leaf which we observe in many other cases ; indeed, the membrane appears to work alone, or nearly so, in all such cases as this ; and when this leaf also works, the operation is much more slow in the performance ; and the changes of colour through which the leaves pass are often many, and sometimes beautiful, so that painters often prefer the autumnal decay to the spring prettiness or the summer fullness of the leaves.

We believe that, in all trees and bushes which have this struggle and change of colour in the leaves in autumn, there is always some corresponding effort in the development of the leaves in the spring. Trees which colour in the autumn begin to show their leaves earlier in the spring, and are longer between the first show and the full development. The mulberry, to which we have alluded, comes late, but is out fully in a few days. It is this tardiness to put out its leaves, and haste to shake them off, which has gotten the mulberry the name of *morus*, "the fool ;" which is, of course, an ironical allusion to the caution of the tree in avoiding the late frosts of spring and the early frosts of autumn.

There seems to be something more connected with the rapid action of this membrane, namely, a power of action in the tree. It is well known that a branch from a mulberry-tree, however large, if planted as soon as it is torn off, will at once grow as a tree ; whereas most other deciduous trees will not grow at all in a large branch, and many not even in a small cutting. This is a part of the subject, however, which requires to be further studied.

The forms of leaves and their textures are exceedingly varied, and afford good external means of distinguishing one plant from another ; but they are not to be depended upon as indicating the qualities of the respective plants. Thus fatal accidents often happen from eating fool's-parsley—which, in some soils, is difficult to eradicate from gardens—instead of the common parsley, which, though pungent, is not poisonous. Similar accidents have arisen from mistaking fool's-watercress for the common watercress, as what are called the leaves of both of these are also very similar. If the latter plants are in flower it is easy to distinguish them, as the wholesome cress is a *cruciferous* plant, or has the petals, four in number, arranged like a cross ; while the poi-

sonous plant has the flower *umbellate*, or with the flower-stalk standing out like the stretchers of an umbrella. There is another means of detecting these two : the leaves of the poisonous plant embrace the stem like sheaths at the bases of their footstalks, and those of the wholesome plant do not. Ground, or treatment, will sometimes alter the qualities of these plants. Thus, wild celery is a very acrid plant, and a wholesome one when it is properly cultivated, though even then it requires to be blanched by earthing up the stem, which also draws up and strengthens the stalks of the leaves, that is, the narrow parts of the fronds, and at the same time renders them tender and juicy.

Though we have mentioned these few particulars, for the sake of such as may chance to be ignorant of facts so generally known, yet the plants of which we have been speaking can hardly be said to have any real leaves. The only plants that have these, are plants whose stems and branches consist of wood and bark, and have their growth in substances between these. Such trees do not work in the above-ground part of their structures in the addition of any new matter, except when they have leaves in a living and healthy state ; and when the leaves are deciduous, or annually cleared from the tree, as they are in the greater number that are to be met with in Britain, the leaves never drop off by peeling till the tree is prepared for answering to the stimulating action of the coming year. In as far as this concerns the lengthening of the parts of the tree, or the production of new branches upon it, it is done by buds. It may generally be observed, that the bud is early brought to maturity in proportion as the decidua parts concur with the action of the cold ; while in some of those species that are to retain their green leaves during the winter, and shed them only when the hot season again sets in, have the autumnal buds very small.

The connexion between the leaf and the flower, and the fact that the cultivator may work either of them as he pleases, at the expense of the other, are not unimportant parts of the story of a leaf.

The leaf is always in some way connected with the production of the bud which contains the embryo flower. This connexion is, in many trees, and in most forest trees among others, with the leaf of the former season ; and then the flower of the season comes before the leaf ; in other cases the leaves of the year are produced before the flowers, and the flowers are on the shoots of the same year, or properly summer flowers ; whereas the spring flowers that come before the leaf, are on the shoots of the former season.—But we must stop.

SITTINGS FOR MY PORTRAIT.

SECOND SITTING.

"WHAT a feast for vanity!" Was that a whisper or a fancy?

"Be pleased," said the painter, "to resume the position of yesterday, it was a *graceful* attitude, and the light so fell as to give a just and pleasing expression to the countenance."

Forthwith he adjusted his canvass, glanced at the several parts of his outline with apparent satisfaction, and seemed to look forward with delighted anticipation to the completion of the beau ideal with which he had fed his fancy. Now then for the elementary likeness; to-day it is, in some degree at least, to manifest itself; I, my family, my friends, posterity, are all to be gratified—fine ideas these!

But *who* whispered the words "what a feast for vanity?" Who, indeed, but *conscience*? And did not the secret monitor speak truly, though then, as heretofore, often rebuked, resisted, and scornfully turned away? That same conscience is a wonderful tell-tale, and what it tells is perfectly and universally correct. Possessed of a kind of ubiquity it can never be escaped; it is every where—at home, abroad, by night, by day, in company or alone, it is still about us and within us, to condemn or to approve, with uncompromising severity of judgment and decision. This same inward judge of right and wrong in human character exposed the appalling fact to our original parents that they were naked and had sinned, though they sought an impossible concealment amidst the trees of the garden;—confounded the notorious king of Babylon amidst his wine cups and his lords, though ten thousand shouts of applause echoed through the hall of a guilty festivity, by fixing his silent gaze on mysterious and unintelligible tracings on the wall;—and overwhelmed by its convincing testimony, with inexpressible anguish and ruin, the betrayer of the great Redeemer of mankind.

The suggestions of conscience ought in every case to be regarded, not only because they are true, but because they are important. The convictions it aims to produce are invariably benevolent in their object, for they are intended to improve character, and promote happiness, by the subjugation of an evil passion, or the advancement of a good principle. While the demon influences of the external world, and the depraved propensities within, would hurry us on to mischief and personal suffering, this sacred instinct of our nature restores to rectitude of thought and feeling, thus ministering both to our intellectual and moral elevation.

But it may be supposed there was no necessity for its interference on this occasion. Whatever may be said of the individual or the occa-

sion, surely much might be said on the subject of vanity; and though one particular exercise of it might appear unimportant, yet whoever has right ideas or right desires with regard to the formation of character, must admit that what is deemed insignificant in itself, may be of material consequence by its associations and results. The infant Hercules is to be dreaded, for its maturity will gradually come,—its gigantic and destructive power is already formed. The passion in question, however, is capable of working inconceivable mischief; and the less liable it is to detection, or the more easily capable of extenuation and concealment, the greater should be our vigilance to trace its insinuating operations, and deteriorating effects.

Moralists have made a strong distinction between pride and vanity, the former being regarded as a higher or nobler order of vice, the latter as more mean and contemptible. Thus, we speak of the *pride* of intellect, and the *vanity* of person and dress. The application of the terms, however, shows an attempt to invest a bad passion with some of the attributes of virtue, and to indulge the spirit of self-flattery at the expense of reason and truth; nay, so perverted are the conceptions of mankind, that they adorn it with factitious lustre, and deem that which is really debasing, capable of dignifying the very animals themselves. Thus they are led to express admiration of what is termed the *noble pride of a horse*! No wonder that whole volumes are written to illustrate and to celebrate this disposition of mind, and that the very basest passions challenge esteem and applause by decking them out in this splendid investiture. After all, pride, which is so often extolled, and vanity, which is so universally condemned, are essentially the same in origin and character; so that, in fact, pride is but *disciplined vanity*, and vanity only the exfoliations of pride. The latter, therefore, has been well denominated "petty pride"—pride operating upon small occasions. But though the one has often been regarded as exclusively the characteristic of superior men, and the other of little minds, neither the one nor the other class are exempt from the power of both. Swift, with a keen discernment of human character, says,—

"'Tis an old maxim in the schools,
That vanity's the food of fools;
Yet now and then your men of wit
Will condescend to take a bit."

There are few occasions in human life when vanity finds a stronger incentive to action, or an ampler field of exercise, than during the period of sitting for a portrait. Your own person, the conformation of every feature, figure, expression,

whatever it may be, is not only to be minutely observed by the painter who is to transfer each and all to the mimic canvass, but, with a flattering unctiousness, are to be pointed out and commented upon by the artist, or the friend that watches the progress of the work, or your own self-approving, self-lauding consciousness. If you are ugly, you have one very striking feature; if no expression, your features are beautiful. You have fine eyes, or handsome eyebrows, or an intellectual forehead, or an amiable mouth; or your face is an elegant oval or circle, or—in short, of one thing you may be assured, you have no faults of countenance or form, or if you have they are not dwelt upon; a mere cursory reference to them, however prominent, will prove that they are absorbed amidst surrounding marks of character. Vanity, like a wily serpent, creeps into the very folds of the dress, and soothes while it destroys.

If a man will be true to himself, this one important advantage is derivable from having one's likeness taken, that it tends to bring out vanity from its hiding-place in the heart, to exhibit a man to himself, and thus, if he be a person of any reflection, to furnish him with the means of moral improvement.

It is commonly difficult to convince persons of the existence of faults which are visible enough to others; and they will exhibit, even when they deny them. There is in us so great an unwillingness to detect what is wrong, so determined an aim to deceive ourselves, to resist stern conviction, and to welcome flattering plausibility, to extenuate and conceal our own errors, and to magnify those of others, that the perfection we dream of is almost always to be found in one form and degree or another in ourselves, and the follies, infirmities, and obliquities of character incident to our fallen nature to be easily detected and very visible in the millions around us. But the pencil of the painter is a kind of Ithuriel's spear, at whose touch the crouching vices of pride and vanity start into view, compelling us, if we do not resolutely avert our eyes, to see ourselves in vexing but in profitable mimicry.

An observant painter might trace the different modifications of vanity in the various classes that from time to time present themselves as candidates for the canvass. It would, perhaps, even require no great discrimination to perceive the diversified operation of this curious passion. He would clearly and easily discover the kinds of vanity in those who were the same by profession, as well as its chief characteristics in each separate person. He might soon witness the developments of the vanity of the senate, the pulpit, and the bar, and of the commoner and the lord. He might mark the vanity both of men and women, of great and little, of babes and sires; and, alas! this vice is worst in the fairest of our race, and vigorous even amidst the feebleness of infancy. Some of high pretensions aim to justify to them-

selves their self-admiration, by desiring the painter to take care to catch that particular resemblance; and some, to conceal their inward mortification at defects of countenance or mind, by denouncing as wrong in the painting that fault of countenance, or vacancy of expression, which is nevertheless true to the life. It is doubtless very unfavourable to the veracity of the canvass, that the painter should know, as he in general must know full well, how readily he will be pardoned for omitting any special blemish, or softening down a notorious deformity; and how certainly he will be denounced and underrated in his art if he should forget or fail to give at least the due degree of prominence to a fancied excellence of face or form. Still this weakness, yea, this *wickedness* of our nature is fraught in its developments with useful lessons to *him*; if it may not be to unreflecting minds—to *them*.

Apocryphal to the above remarks is a story which I lately heard, and which is but one of a thousand of a similar kind. A lady young and fair had married a gentleman (*proh pudor!*) aged and unsightly; but both agreed—he being the delighted dupe of soft persuasions—that his portrait should be forthwith taken. They accordingly proceeded to the house of an artist, and even acceded to rather an extravagant charge. He sat patiently and anticipatively. The work was finished—the likeness complete. The painter himself accompanied it home; it was exhibited, and, alas! alas! it disappointed. “No, sir,” exclaimed the lady, “it is not like, it cannot be like.” “Madam, I have taken, as I found myself bound to do, unusual pains. My own impression is, that I have fully succeeded, and I trust it will please.” “My husband like that? Impossible! Besides, every little scratch or fault is not to be so marked; a likeness should be a general and striking representation of the whole character of countenance —” “Madam, I beg pardon. I am very anxious to succeed; I will furnish another painting, and I am certain of giving you satisfaction. There shall be no additional charge.” The agreement was made, and the task resumed. The painter had wit enough to perceive that the disappointment arose, not from its being a failure, but from its being too perfect a likeness. He saw that his business was to please, and in his second performance he carefully omitted or softened down every carbuncle, wrinkle, or spot; it was then done to admiration—an excellent likeness; he was paid with the greatest cheerfulness, and with wine and thanks. The fact was, he first made a *likeness*—that would not do; then he drew a *picture*—that was satisfactory.

The fact is, that vanity does not wish for a likeness, it wishes for concealment or exaggeration; it consists in a false estimate of ourselves, or of the trifles which belong to us; and that it is that imaginary excellence, whether of person or mind, that it desires in some way or another

to be impressed on the canvass, for itself and for others to admire. It is the picture in a man's own mind, and not the reality of corporeal form, which vanity is solicitous to have caught and perpetuated,—a kind of other self, the self of fancy, not of fact. What a folly and an illusion! as if others could be as much deceived, and overreached, and befooled as our own beloved and flattered selves!

Dr. Johnson, though generally correct and profound in his views of human nature, has surely committed an error in a paragraph upon this subject, written in the "Idler." "Whoever," says he, "is delighted with his own picture, must derive his pleasure from the pleasure of another. Every man is always present to himself; and has, therefore, little need of his own resemblance, nor can desire it, but for the sake of those whom he loves, and by whom he hopes to be remembered. This use of the art is a natural and reasonable use of affection; and though, like other human actions, it is often complicated with pride, yet even such pride is more laudable than that by which palaces are covered with pictures that, however excellent, neither imply the owner's virtue nor excite it." It is true, that a man being always present to himself he may have no need of his own resemblance; but it does not follow that he may not desire it, even without reference to those he loves, or by whom he may be remembered. A vain person takes pleasure in his or her reflection in a glass, not merely because of

the beauty or expression which is to gratify others, but often solely for self-gratification. It is to please a personal fancy or consciousness; and, for the same reason, a minute painting might, and doubtless would, afford pleasure to a vain person, though it were never exhibited. The latter is doubtless a means of greatly augmenting the pleasure, but it is not the sole cause. It is objectionable, besides, to speak of pride as laudable in any of its exercises, and more or less so in particular cases. What is entirely condemned by Christianity, can never be justly a subject of approval in any degree, or even of toleration. We might as well refer to robbery or sensuality, to envy or covetousness, as more or less laudable. On the contrary, we should oppose, denounce, and aim at the extermination of every evil principle. Other objections might be made against the concluding comparison, but these remarks may sufficiently rectify what is most exceptionable.

Besides the pride or vanity of sitting for one's portrait, there is the pride of *not sitting* for it; for there may be pride in the pertinacity of refusal, as well as in the readiness of compliance. The case is the same here as in what is technically termed "taking honours;" poor human nature is exhibited in both instances, and in a similar manner. "To yield or not to yield, that is the question; whether 'tis nobler ——" but stop, it has been already shown there is no nobility in a bad passion.

THE LEVEE AND THE DRAWING-ROOM.

(From Colton's "Four Years in Great Britain." 1836.)

THE LEVEE.

THE throne-room is the place of reception; the adjoining apartment, George the Third's room, is occupied by foreign ambassadors, ministers, nobility, and other distinguished personages; Queen Anne's room principally by commoners and strangers, until the time has come for a general mingling.

It happened that the Duke of Wellington appeared in his robes as chancellor of the University of Oxford, accompanied by a respectable corps of the academical and chief dignitaries, also in their official robes, for the purpose of presenting a petition to his majesty, that he would graciously be pleased to put a stop to the impertinencies of the dissenters, and to resist their unreasonable and arrogant claims. The duke's robe was a new one, with some yards of train, all of black satin, and not a little heavier for the gold that was laid along its borders, from the collar to the end of the train. The train of a robe is a troublesome and inconvenient thing to manage by men or women, and is always in the way of somebody's feet; they have the privilege, however, of

carrying it on the arm, except in the presence of majesty.

After the company had been half an hour in waiting, the doors of the throne-room were opened, displaying his majesty on the throne, supported by members of his family and high officers of state; and a guard of the honourable corps of gentlemen at arms were marched in, forming two ranks from the foot of the throne to the door, between which the Duke of Wellington entered at the head of his *academic* corps, all making obeisance as they approached the throne. The petition was read audibly and distinctly by the duke, and his majesty nodded gracious signs of attention. This ceremony being ended, the duke, his academic staff—a new sort of staff for him—and the guard retired, when the centre door was closed, a side one thrown open, and a call made for the foreign ambassadors and ministers, whereupon ambassadors and ministers took rank according to seniority of residence at court, and prepared to pay their respects to the king. The king had taken his station near the door, in front of the first window; the lord chancellor

(Brougham) held the purse, standing motionless, like a statue, a very unsuitable office for him ; his majesty being surrounded and supported by those appointed to wait upon his person on such occasions, the dukes of Cumberland and Gloucester being among the number.

The king takes his station in the throne-room on his feet, and uncovered, at a point most convenient to receive his company, in like manner as the president of the United States on similar occasions. He does not give his hand ; the salutation of the parties as they meet, the king being always one, is the best bow they can make—a series of bows, concluding with a *congé* from the king, differing from other bows by a peculiarity more easily recognised than described, which signifies, "You may pass on." His majesty, of course, cannot speak to every one, and in the majority of cases the bow of reception and of *congé* immediately succeed each other. With most of the foreign ambassadors and ministers he has a word or two ; but he cannot have time to speak to one in a score of those who approach him on such an occasion ; yet the opportunity of observing the king's form, features, and manner, is excellent.

I cannot claim the honour of having held a conversation with his majesty. When I was presented I happened to stand very close to him, within two feet or eighteen inches ; he received my name from Mr. Vail, with such particulars as were proper to be mentioned ; then turning to me made several very low bows, the marked civility of which compelled me to attempt some like courtesies in return ; and had we not both stepped back a little, to give space for those arcs of circles described by our heads, we certainly should have bumped rather unpleasantly. Immediately on passing the king I returned to mingle with some sprigs of nobility, strangers, clergymen, and others, who had the privilege of the *entré*, but did not belong to the diplomatic corps. The doors to the throne-room being open, we could still see what was passing there without difficulty. I took my station in the recess of a window, where I could see the king receive his company, and observe his manner. By this time all that had been admitted with the *entré* had paid their respects to his majesty, and immediately the door of the other room was opened to admit the commonalty.

THE DRAWING ROOM.

We left our names at the reporter's table in the portrait gallery, according to custom, and arrived in the middle state-apartment, or George the Third's room, next to the throne room, at a quarter before two o'clock. There were not many in by this time.

Soon after we entered the room the centre folding-doors at both ends flew open, and the

Duchess of Kent was announced. As by magic, a passage was opened through our apartment, and all turned to pay the duchess respect. She entered, being ushered in by the men in waiting, followed by the ladies attending upon her, but without the Princess Victoria. It would have been especially agreeable if I had seen this young heiress presumptive to the British throne under such circumstances. The duchess curtsied and bowed with great grace, both to the right and left, as she passed through the opened and smiling ranks. She is a woman of truly royal bearing ; her looks are most interesting, even charming ; her manners expressing every winning grace. No wonder that she is popular ; and if her husband had lived she would have been the idol-queen of the nation. She glided into the throne-room to join the royal party, and to support the queen during the ceremonies ; and the doors closed behind her.

The throng in our apartment continued to increase, by new arrivals, for nearly an hour ; and such also, I perceived, was the fact in the east room, until the latter became absolutely crammed. I hardly need say that every thing around had now become the most brilliant scene I had ever witnessed, as brilliant, indeed, as the great wealth of the English nobility, lavished in the richest profusion on the persons of the fairest of their women, and of their high and honourable men, could make them ; and this in no wise diminished, but increased, by that borrowed splendour which the presence of the representatives of the greatest and richest nations of Europe added to the general effect. It was a dazzling pageant. The East contributed its gems, Africa its snow-white, lofty, and nodding plumes, the shops of Europe furnished the wardrobe, and her arts mingled the colours, determined the forms, and fixed the relative position of all the parts of this moving diorama.

The doors to the royal presence opened ; an instinctive movement seemed to bring all whose duty it was first to offer their respects to the queen into their proper places. I cannot speak positively as to the order in every particular, but the foreign ambassadors and ministers seemed to me to take the lead. A plural number of distinguished females, however, threw down their trains and preceded us, among whom was the Duchess de Dino, niece of Prince Talleyrand, and Madame Tricoupi, the lady of the Grecian minister, who was now for the first time presented.

The king stood where he did at the levee, supported by certain lords in waiting on his right, and his brother Cumberland, and cousin Gloucester, on his left, with a nephew, Prince George of Cumberland. The queen stood immediately before the throne, a little to the right, supported by the Duchess of Kent and her attendants on the left, and by her own personal retinue on her right. The king's dress was a scarlet coat and

a military uniform ; the queen appeared in white satin, with a pearl head-dress.

Our progress after entering the throne-room was exceedingly slow. I stood opposite the king, with only space for one person to pass between me and him, for about ten minutes. The queen was occupied during this while, I believe, with Madame Tricoupi, wife of the Grecian ambassador. In the mean time the Duchess of Richmond came between me and the king, and talked with him freely. The king spoke very low, and I caught but a few words.

"Poor fellow," said the king to the duchess, "I am told he was very miserable. I am extremely sorry not to see him," &c. They appeared to be speaking of the death of some person, I know not who.

"And are you in town?" said the king, &c.,

to the duchess. The Duchess of Richmond is evidently a very superior woman ; her looks and manners are exceedingly interesting.

Next came Earl Grey and talked with the king, while I stood in the same place. The noble earl has a head that is worth looking at. As I had a fine opportunity for a close observation of the king's countenance for several minutes, while he was engaged in conversation, his features seemed to me quite of the benevolent character.

We at last came in our turn to the queen. She received my name, looking alternately at Mr. Vail and myself, and very graciously asked how long I had been in England, expressing a wish that my visit might be agreeable. She curtsied, and we passed along to give place to others.

DIVINE CONDESCENSION.

SOME of the most magnificent expressions of Scripture are those which relate to the Divine condescension. The doctrine that the infinite God, who inhabits immensity and eternity, enters minutely into all the affairs of his creatures, presented to the mind of the psalmist an image of condescension so overwhelming, that he exclaimed, "Who is like unto the Lord our God who dwelleth on high, who humbleth himself to behold the things that are in heaven, and in the earth!" Observe, he couples together the things that are in heaven and earth without distinction. Now, to our apprehension, the things of heaven are inconceivably greater, more important, more worthy the Divine attention, than the things of earth. But in the eye of God the difference is only a difference in minute degrees—a difference in degrees of littleness—and therefore, in itself, a very little difference.

Were you, from the top of some lofty eminence, some dizzy height, to look down upon two objects—the one a man and the other a child—though they would doubtless consider the difference between themselves to be very great, to you it would appear to be very little, if any. This, indeed, would arise from the necessary imperfection of your organs of sight—but the idea may serve for an illustration. For while to our apprehension the things of heaven are unspeakably greater than the things of earth, we are to bear in mind that the Almighty is infinitely higher than the highest created intelligence in heaven ; that while the difference between the highest and the lowest of his creatures can be measured, the difference between him and the highest creature which he has formed cannot be measured ; so that he has to look down—(if we may say so) he has to look down from an infinite height upon the highest as well as upon the lowest, upon the things that are in heaven as well as upon the things that are in

the earth. The wonder is that he condescends to regard the things that are in heaven ; but having stooped thus far, we are prepared to hear that he stoops a little farther, and regards the things that are on earth. For though there is a difference between them, and though his eye measures that difference in all its proportions, yet is it really so insignificant to Him whom heaven and the heaven of heavens cannot contain, that it is an act of infinite condescension in him to notice either.

Looking at the history of this condescension towards man, there appear to have been four remarkable stages in it, at each of which we behold him carrying it a degree farther than before, until he has reached the very lowest point to which it could be carried. We say nothing of the benignity which he displayed towards our first parents, while yet they retained their original purity,—benignity which showed itself in symbolically walking with them in paradise, in visible manifestations, in frequent and familiar converse. *That* belonged to a state which soon passed away, and of which we know little more than this—that it once existed. But we have to contemplate the Divine conduct in a subsequent and far different state—a state which was commenced by an act of disobedience and rebellion against God—a state in which man has outraged every attribute of the Divine character, in which he has lost all love and likeness to God, and has joined in league with his enemies ; in which the prevailing habit of his mind is that of enmity against God ; and a state, therefore, in which his holy and insulted Maker might justly have left him to perish, and have withdrawn and enclosed himself for ever within the depths of his everlasting dwelling-place.

Now it was towards man in this state that the Almighty took the first step in his career of con-

descension, *by speaking to him*. He broke the fearful silence which sin had produced, and which might have lasted for ever, and spoke to us. And every accent he uttered was an accent of love. For the sentence which consigned our bodies to the stroke of death was only the application of what had been *previously* threatened; while every *additional* word was intended to mitigate that doom, by inspiring us with the hope of being finally delivered from it. And having broken the silence, he proceeded to address us at sundry times and in divers manners. He prescribed the way by which we might hope to regain his favour; he added promise after promise to encourage our obedience; and though it did not comport with the majesty of his holiness to maintain, as before, familiar intercourse with our polluted race, yet every time he spoke to us he opened a fresh view of his excellence, and furnished an additional proof of his condescension.

Another stage in his divine condescension to man was, when he appointed a place for the symbol of his presence to dwell in, and where man might be always welcome to approach and commune with him. That *PRESENCE*, indeed, was concealed from the public eye, and could be approached only in a prescribed manner. But still it was a vast advance in the Divine condescension: it seemed to say that his benignity knew no limits; it seemed to place earth in close proximity to heaven. When Solomon offered up the first prayer at the dedication of that hallowed edifice, he appears to have been almost overwhelmed with the idea:—"Will God," said he, "in very deed dwell with man upon the earth? Behold, heaven and the heaven of heavens cannot contain thee, how much less this house which I have built!" Will the Divine Omnipresence take up his dwelling here? Is not the expectation too great to be realized? Will he do so "in very deed?" To this appeal of his servant, which showed a mind labouring and staggering under the amazing conception, the Almighty replied, "I have chosen and sanctified this house, that my name may be there for ever; and mine eyes and mine heart shall be there perpetually." And through a long succession of ages he continued to meet with his people there, and to commune with them from off the mercy-seat.

But all this—astonishing as it was—was only preliminary. The next stage in the condescension of God to man threw all its past history into the shade. The "*WORD*" himself became flesh and dwelt among us. Great, indeed, is the mystery of godliness: God was manifest "*in the flesh*"—came and tabernacled among us in our own nature. By a mysterious act he took our nature into union with his own, and actually walked the earth, conversed with us, instructed us, pitied and wept over us, by all the arts of a divine compassion commended his love to us. This was a stoop of condescension immeasurably deep. Be-

yond *this* (we might have said) he cannot go—even *he* cannot go. He has now reached the lowest point to which he can descend, for he has reached the low basement of earth, he has placed himself on a perfect level with ourselves. We have now seen the utmost limits of his condescending grace.

"But my thoughts are not your thoughts, neither are your ways my ways, saith the Lord." Look at that cross—at Him who hangs upon it. Look at that bleeding form—that is a lower point of condescension. He is *dying*—dying for us—dying for us *the accursed death of the cross*. "He was in the form of God, and thought it not robbery to be equal with God; but he made himself of no reputation, and took upon him the form of a servant and was made in the likeness of men; and being found in fashion as a man, he humbled himself and became obedient unto death, even the death of the cross." *That was*, indeed, the lowest point to which he could descend. The sun shrunk back, amazed at that sight; angels hung over it perplexed, unable to comprehend it. All nature sympathized and wondered. And shall we, for whom all this voluntary humiliation was endured, be the only beings who are unmoved by it?

Let us glance at the ground over which we have passed. We have seen that man had reduced himself to the condition of an enemy against God; and that with this condition he was in love, when God, who is rich in mercy, resumed the intercourse which sin had interrupted, by speaking to him. This was the commencing act of his condescension—and it was amazing. When any thing of a similar kind takes place among men—when a party injured is known to have spoken first to the party which injured him, especially too if he be his superior in rank—the act is spoken of with unfeigned admiration. But that the Creator should have thus acted towards his creature—that the infinite God should have first spoken, and have spoken amicably, to the poor, alienated, debased children of men, surpasses unspeakably the utmost condescension which man can show to his fellow-man. And still more, that he should appoint a place for his presence to dwell in, where we might go and commune with him; that he should hide from our sight the glories of his throne, lest they should overwhelm our feeble spirits; that he should conceal from us the ministries of his celestial court, and, dismissing that train which filleth the temple above, should stoop to visit the lowly abodes of those that fear him, and dwell as a Father in the homes of earth—this was a lower stage in his condescension still. That he should have left the high and holy place which he had inhabited from eternity, and have assumed the nature of his creature man, and have become a resident on earth, was another and a far lower stage in his condescension still. But that while

here he should have submitted to suffer death—"the death of the cross"—by the hand of those he came to redeem—was a depth of condescension never before imagined, never after to be surpassed. If he humbles himself when he only

deigns "to behold the things that are in heaven and earth," then what shall we say of his condescension in becoming flesh, and dying for us? It is the everlasting wonder of the universe.

CHARLOT TAYON.

It is curious to speculate on the infinite variety of causes which have influence in the formation of character; on the numerous diversities which are found under different circumstances; and the multiplicity of qualities, which in their various combinations, make up each whole. What any man might have become under different training, or with different fortunes, it is vain even to conjecture. Yet we cannot refrain from speculating on the change which circumstances might have made in the characters and destinies of many, who "crawl from the cradle to the grave" unregarded and unknown.

Poor Charlot Tayon! I have often puzzled myself to tell to what class of men he belonged by nature. Illiterate, uncultivated, ignorant, bred up on the outermost verge of civilized life, and spending all the prime of youth and manhood far beyond it, it was hard to tell whether this rude training had retarded or encouraged the growth of those qualities which made him in my eyes a remarkable man.

A native of Upper Louisiana, he had entered in early youth into the service of the king of Spain, as a private soldier. His corps was one of those whose duties condemned them to pass their days in the wild prairies, which, extending from the neighbourhood of the Mississippi to the Rio del Norte, serve rather as the range than the habitation of small but numerous bands of Indians. Such a life is of course a life of toil, hardship, and danger. The qualities which fit a man to encounter these, are, under other circumstances, rewarded by fame. Even in scenes so remote, they do not always fail of a reward, which to him who receives it seems like fame. His few companions are his world, and their applause is to him the applause of the world. He perils every thing to win it, and having fought his way to the head of a company of rangers, is as proud, and with as good reason, as Wellington himself of all his honours, purchased at less expense of hardship or danger. It is thus that I account for the unequalled pride of this poor old man, associated as it was in his uncultivated mind with all that lofty courtesy which so surely accompanies a just sense of unquestioned and unquestionable merit.

I have said that he began life as a common soldier. A campaign of hard service was rewarded by the rank of fourth corporal. Another gave him the third place among those humble but important officers. In eight years he rose, step by step, and year by year, to the rank of first ser-

geant. Three more placed him, by the like regular gradations, at the head of his company.

As this was an independent corps, serving at a distance from the settlements, and only returning to them at long intervals, his station was one of great responsibility. This he assumed boldly, and exercised freely. Incapable of fear, he was not easily withheld from the danger by a distant authority, and, relying on the brave man's maxim, "that success in war justifies a breach of orders," he made little scruple of disregarding his, whenever an opportunity of striking a blow presented itself. On some such occasion he incurred the displeasure of his immediate superior, the commandant at St. Charles. To this worthy, the success which exposed the impolicy of his own cautious prudence, was by no means a justification for disobedience. He accordingly recalled Tayon, imprisoned him, and sent him in chains to New Orleans.

Here the history of his imputed offence was so creditable to him, and the bearing of the rude soldier so forcibly struck the intendant, that his persecutor was deposed, and the prisoner returned in triumph, bearing with him a commission as commandant of the post.

This was, in his estimation, the acmé of greatness to a subject. Of the unapproachable majesty of the "king his master," as he delighted to call him, he might have formed some such conception as we have of angelic natures. But among mere men of common mould, he had seen nothing, until his forced journey to New Orleans; and had perhaps never imagined any thing above the dignity that encircled the commandant at St. Charles.

There is nothing strange in this. An officer at once judicial and executive, supreme in both capacities, always acting in person, and enforcing his authority by the summary processes of despotism, is an awful personage in his province.—Though but a king of Lilliput, he is a king to Lilliputians, and especially to himself. Such was Charlot Tayon in his own estimation; he truly "bore him like a king," and when the throne of his power was removed from under him, he lost nothing of majesty in his fall. He was neither Dionysius at Corinth, nor Bonaparte at St. Helena. He was neither familiar nor peevish, nor querulous, but sat himself down, in quiet poverty, in a cottage on the edge of the village over which he had reigned.

I saw him but seldom, but always delighted to

converse with him. I found him uniformly affable, courteous, and communicative. Though too self-respectful to talk gratuitously about himself, a little address alone was necessary to make him do so. He spoke not a word of English, but though illiterate, (for he could not read,) his French was remarkably pure and euphonical.—Speaking slowly and deliberately, and calmly, in a strong, stern, sustained tone, with a countenance which bore no trace even of a bygone smile, there was more to strike the ear and awaken the imagination in his manner, than in that of any man I ever saw. The *tout ensemble* spoke an ever-present, deep, but proud and uncomplaining sense of wrong unutterable and irreparable. His figure, except on horseback, was awkward and ungainly. He was very old, and moved with difficulty. His short legs and arms, his broad bony hands, and his huge Roman nose, reminded me always of the legs, claws, and beak of a parouet. His features, however, were not bad, though harsh. A deepset dark grey eye surmounted by a shaggy brow, and a mouth firmly compressed and flat, were in perfect keeping with the rest of his face, and in character with the man. His dress was uniformly a blue cotton hunting shirt and trowsers, with mocassins on his feet, and a blue cotton handkerchief tied on his head, in what is called the French fashion, with the ends hanging far down his back. In this garb his centaur figure, mounted on the back of a wild horse, was certainly one of the most picturesque I ever saw.

I once drew from him a sort of a sketch of his life. It was a little more than a confirmation of what I had heard from others. But his manner, and the ideas which escaped from him, gave me more insight into his character. His was the first example I had ever seen of loyalty, not originated in personal attachment, wholly uninfluenced by personal considerations, adopted as a principle, but cherished into a passion. I doubt if he knew whether the king he served was king of France or of Spain, and am very sure he knew no difference between Charles III., Charles IV., and Ferdinand. Whoever he was, he was "*Le Roi mon maitre*." As such he always spoke of him to the last, owning no other allegiance, acknowledging no other political obligation but the will and pleasure of the "king his master." Was he therefore malcontent?—just the reverse. "The king my master laid his commands upon me, to deliver up the post which he had done me the honour to place under my authority, to an officer appointed to receive it on behalf of the United States; and I obeyed him. He gave me to understand at the same time, that it was his pleasure that I and my people should submit to the authority of the United States, and conform to their laws, and I have obeyed him. You see me quietly acquiescing in the new order of things, and endeavouring in all things to regulate myself by

your laws; and I do so, because the king my master has commanded it."

There was nothing in his manner of saying this betokening that restiveness with which men submit to what they cannot help; he seemed merely to find a satisfaction in rehearsing the principles by which he had always professed to be governed, and contemplating the conformity between these and his actions.

At the time of the cession of Louisiana to the United States the old man was in comfortable circumstances; the best house in the village was his, and he had slaves and several arpens in the common field. But he had now fallen on evil days. He scorned to acquire any knowledge of the language, laws, and customs of the new masters of the country, and desired only to live in retirement and obscurity. But he could not help having some dealings with the world, and the management of these he committed to an only son, who had acquired a considerable proficiency both in the language and laws of America.

But if master Louis excelled his father in these things, he was as much his inferior in every honourable and manly virtue; in short, a greater knave never breathed, as soon appeared, by his so managing the old man's affairs as to reduce him to want. At the same time his craft, though sufficient to defraud his father, was no defence against the superior art of the adventurers who flocked to the country: he, too, was reduced to poverty; and, spurned by his father, detested by his countrymen, and despised by the Anglo-Americans, his name was a byword of scorn. But he still bustled about, trafficking in every thing he could lay his hands upon, negotiating bargains between the new comers and the old inhabitants, and cheating both as often as he could. But the profits of his villiany were small, for he was too cautious to venture on any bold measure.

At length, however, the fiend he served seemed to have betrayed him into the hands of his enemies. At the opening of one of the terms of St. Charles' Court, I found his name on the criminal docket. I looked for the charge, and found it to be for stealing a slave. This was a capital offence, and I at once concluded that Louis's time was come. He had not a friend on earth; no witness could be expected to soften a word of testimony; no juror would do violence to his conscience for his sake, and he had therefore no hope but in innocence; and nothing could be more improbable than that.

The trial came on. In a corner of the room I observed a cluster of the poor peasantry of the village huddled together, with looks of concern and awe, occasionally muttering in low and earnest tones. They are a good-natured people, and I was not surprised to see, as I supposed, some tokens of relenting toward poor Louis. But I was soon led to put a different construction on

their manner, when I caught a glimpse of a figure sitting with the head bowed between the knees, which I at once recognised as that of the culprit's father.

As the cause proceeded the excited interests of the old man came in aid of his pride, and he at length raised himself, made signs to those around him to stand aside, and thus sat full before me. He was pale and ghastly, and his eye was sunken, fixed, and rayless; with a countenance betokening stupor, like that of one just recovering from a stunning blow, he appeared to look on without seeing, and to listen without hearing.

It turned out that Louis's case was not so bad as I had apprehended. The prosecution was conceived in folly or malice, for the slave had been taken on a claim of property, by the advice of a lawyer. Of course, I had to say but a few words to the jury, and he was acquitted.

This turn of the case was so sudden that the poor Frenchmen, who understood only a word here and there, were unprepared for it, and began among themselves an eager jabbering, which at length awakened the faculties of the old man. He caught a few words, and then seemed, for the first time, to listen understandingly to what he heard. But whatever emotion he felt was either repressed by self-command, or buried in the depth of conscious abasement. He soon rose and left the room, followed by the little party that had surrounded him.

The next morning I happened to be passing through the bar-room of the house I lodged in, and as I entered the door I heard the bar-keeper say, "Here he is." I looked up. There was only one other person present, and his back was to me. Turning at the moment I saw it was old Charlot. I immediately approached him, accosting him with marked courtesy. He seemed not to hear me, but tottered toward me, looking up in my face with a dim lack-lustre eye, as if endeavouring to distinguish who I was. As I accosted him, extending my hand, he laid hold of it and drew himself forward, still gazing on me with the same fixed, inquiring look. "*C'est Monsieur le juge ?*" asked he, in a subdued and tremulous voice. At the moment his eye found the answer to his question, and before I could speak he had fallen on his knees, and my hand was pressed to his lips, and bathed in tears which rained from his wintry eyes. I was inexpressibly shocked, and more humbled in his humiliation than at any other moment of my life.

I raised him with difficulty, and, in a voice choked by tears, he tried to speak. I knew what he would say, and replied to his meaning: "You have no cause to thank me," said I; "your son had done nothing for which he could be lawfully punished; his acquittal was inevitable, and he has merely received sheer justice at my hands." While I spoke he recovered himself enough to speak. "Ah! Monsieur," said he, "that is true; but in the case of a poor wretch hated and despised by all, who neither has nor deserves to have a friend on earth, is not mere justice something to be thankful for? Bad as he is, he is my only son; and I must have leave to thank you."

I led the poor old man to a seat, and tried, as soon as possible, to change the conversation, and lead his mind to the topics on which I had heard him before dwell with pleasure. A question about his friend and comrade, the famous Philip Nolan, effected my object. His dim eye for a moment flashed up, like the last flickering of an expiring lamp, and he became eloquent in praise of the companion of his youth, his fellow in arms, and partner in innumerable dangers. The excitement soon died away, but it subsided into calmness and self-possession. He rose and took his leave with recovered dignity of manner. He tottered to the door, and to his horse,—a half-broken colt, which he mounted with difficulty. As he touched the saddle he became a new creature; his infirmities had disappeared, and he was now a part of the vigorous and fiery animal he bestrode. There he sat, swaying with every motion of the prancing horse, restraining his impatience with a skill and grace too habitual to forsake him, and with an air betokening a momentary flush of pride. He was like Conrad restored to the deck of his own ship. I could not see his face, but I had pleasure in thinking that the excitement of the moment might operate as a cordial to his drooping spirit. I looked after him as he passed up the street in a curvetting gallop, with his head-gear streaming on the wind, and bethought me I might never see him again.

I was not mistaken. The blow that brought him to his knees before any but his God, or "the king his master," had crushed his heart; he never held up his head again, and was soon at rest. The prevalence of the Catholic religion among the French has preserved one spot sacred to the men and customs of other days,—and there he lies.

FANATICISM.

THE other day, while turning over the pages of a modern volume of divinity, our attention was arrested by the following passage:—"Enthusiasm has the glory of the sun to kindle up its mists and clouds with

beauty; fanaticism has thunder, and lightning, and meteors in its gloom, and the tempest which it threatens may be soon dispersed. But bigotry is the palpable obscure, the solid temperament of darkness

mixed with drizzling rain; its pestilential vapours blast the lovely fruits of piety and goodness; while all noxious, all prodigious things crawl forth, and increase the horror of the night." We closed the book, and as is our custom when suddenly awakened to thought, we yielded to the wholesome process of intellectual rumination. The somewhat gorgeous and not very intelligible sentence we have quoted, seemed to present us with an inexhaustible theme for inquiry and reflection. Here were metaphysics, poetry, and theology, not very accurately distinguished, nor conveying any very precise ideas, strangely blended together; and, as it would seem, rising before us for the very purpose of tasking our faculties. We found ourselves at once defining the terms enthusiasm, fanaticism, and bigotry; tracing them to their origin, accounting for their distinctive characteristics, and ascertaining how far the author's descriptions of their attributes are borne out by the evidence furnished by their natural history and their practical results. Our thoughts and imaginings were at first confused: but when, like the original chaos, they began to assume something like form, and to promise, if not a new creation, a volume, or at least an article, they were at once suspended by the appearance on our table of a work on the very subject which had so deeply employed them.* And this work, which we have perused with critical attention, we are happy to introduce to our readers as philosophical and imaginative, maintaining the high and refined morality of the Christian Lawgiver, and breathing his spirit of compassionate tenderness towards the weaknesses and infirmities of human nature.

The author has very justly distinguished between the original constitution of man, and those evils which the deprivation of that constitution engendered. Thus he has clearly shown that enthusiasm and fanaticism are identical in their source, and that bigotry is only a precocious and aggressive variety of fanaticism, by which it acts offensively towards those who become the unfortunate victims of its malignant influence. Enthusiasm is good in itself, and has nothing but good for its object. It is the exaltation of the human agent above the little motives and the gross selfishness by which our nature is debased; it is the pure element of benevolence, which, excited and roused into energy, is conversant only with the sublime and beautiful in nature, in art, and social virtue. Its goal is perfectibility, a glorious and a happy universe. When religion becomes its grand incentive and its end, it is spiritualized, materialism sinks into nothing in its estimation, and it is bounded only by eternity. All is not spurious that is enthusiastic; though it cannot be denied that its tendency is to an extreme, and that extreme the exaggeration of imaginative piety into a principle which totally unfits its votaries for the business and duties of the actual world in which they live. While enthusiasm is confined within its proper limits it elevates the character of religion; when it degenerates into something allied with human weakness, it ought to excite our pity: but when it is associated with malignant passion, and is transformed into fanaticism, it deserves only our execration and contempt. The great distinction between enthusiasm and fanaticism is this—the one elevates the nobler principles of our nature, the other works chiefly upon what is base and vicious. This view of the subject justifies the God of nature, and relieves us from the painful emotions which we sometimes feel, when contemplating the guilt and the misery of our species. "What the outline and symmetry of the moral form was as it came from the hand of the Creator, may be more readily determined in the dry method of ethical

definition, than vividly conceived; and this is especially true of those emotions which imply the presence of evil. How delicate the task, if indeed it be a practicable one, to trace the line between nature (in the best sense) and deformity—between the true and the false in these instances! And yet the most rancorous or foul of the malign sentiments cannot be considered as any thing else than a disordered state of some power indispensable to the constitution of a rational and independent agent. We need then take care lest, in our haste to condemn what is evil, we should denounce as such that of which God himself is author, and which, if we think closely, cannot even be conceived of as altogether wanting in a being placed where man is placed. Within a certain line there can, however, be no difficulty in deciding between good and evil. It is quite obvious that a passion or appetite subservient to some specific purpose, is in an irregular state when it overpasses or fails to secure that purpose; the end must give law to the means; and where the end may clearly be defined, the limit which the means should reach is not hard to ascertain. Either by *excess* and too great intensity, or by *perversion* or misdirection from their proper object, or by prolongation from momentary impulses to habits and permanent qualities, as well the animal appetites as the irascible passions assume a pernicious form and derange the harmony of nature."

It is not our purpose to establish and illustrate this assumed principle of the author of *Fanaticism*. It is quite sufficient for us to observe, that from various inductions of facts he has confirmed it beyond the possibility of contradiction. He has proved that evil for the most part is the abuse of good, the perversion of what is right; confounding ends and means, while the avowed object is the same. Thus the best things, when diverted from their legitimate intention, become the worst; thus religion, the greatest blessing to such a being as man, when perverted is his greatest bane. He turns into a curse what would otherwise ensure his own happiness and that of society. The history of fanaticism furnishes abundant proof to establish this appalling fact; and though it never can impress, to any very large extent, its demoralizing and ruinous character upon the present enlightened age, its threatenings in particular instances ought to fill us with dread and alarm; it may not become an epidemic, but its appearance in any of its forms should awaken us to a sense of our danger: if it do not prove infectious, it may drive us to the opposite extreme, and induce a moral disease equally malignant and destructive. When it does not propagate itself it engenders infidelity and atheism, and by making religion appear odious, altogether subverts its claims, and renders it a byword and a reproach. Burke, indeed, has told us, that man by his nature and constitution is a religious animal, and that atheism is not only opposed to our reason but to our instincts. But the depravity of man has transformed this natural instinct into one of the most ferocious maladies that can infect the human heart. If irreligion has slain its thousands, perverted religion has destroyed its myriads. Its most rancorous form is that of fanaticism—its superstition stimulating to madness all that is cruel and vindictive in the human agent, converting the man into a demon, and sending him abroad among his fellow-creatures like a wild beast, seeking whom he may devour.

The author of the work which has induced this train of reflection has thus analyzed this hateful principle. In the fourth section of his treatise, entitled "*Fanaticism the Offspring of Enthusiasm, or combination of the malign emotions with spurious religious sentiments*," he observes, "The imagination, when inflamed by anger and hatred, exerts a much more decisive influence over the active principles and the

* "*Fanaticism*;" by the author of the "*Natural History of Enthusiasm*."

character of men than otherwise ever belongs to it, (them); or we might rather say, that by the aid of those strenuous elements of our nature, imaginative sentiments extend their empire, and bring under their sway minds of a robust order, which would never have yielded to any softer impulses. A thousand fanatics have run their course of mischief, who would have spurned religious motives altogether in the simple form of enthusiasm. Rancour has been the true reason of their religion, and its rule and end. And as the empire of spurious religious sentiments is greatly extended by their alliance with the malignant passions, so do they acquire from the same quarter far more energy than they could boast in their simple state. A malign enthusiasm carries human nature to the very extreme boundaries of emotion possible to man; nothing which the heart may know, lies beyond the circle occupied by fanatical extravagance; and this circle of vehement sentiments includes many enormities of feeling or of conduct, of which scarcely a sample is to be found in a country and in an age like our own."

Distinguishing between the moral elements of enthusiasm and fanaticism, he goes on to say: "The false religion, then, of the fanatic includes elements not at all known to the mere enthusiast; and before we descend to the particular instances, it will be advantageous to ascertain the general, if not universal, characteristics of the spurious malign religion which animates his bosom; they may be reduced to three capital articles; namely, 1st, a deference to *malignant invisible power*; 2nd, the natural consequence of such a deference, rancorous contempt, or detestation of the mass of mankind, as religiously cursed and abominable; and, 3rd, the belief of corrupt favouritism on the part of invisible powers towards a sect or particular class of men; and this partiality is the antithesis of the relentless tyranny of which all other men are the objects."

From these premises, ably supported, the writer proceeds to show the different ways in which this malignant principle thus fostered generates its various abominations. He divides fanatics into several classes, admitting that the division occasionally comprehends individuals attached to each. "For the purpose of fixing a characteristic mark of each of our classes," he observes, "let it be permitted us to entitle them as follows; namely, the first, the fanaticism of the scourge, or of personal infliction; the second, the fanaticism of the BRAND, or immolation and cruelty; the third, the fanaticism of the BANNER, or of ambition and conquest; and the fourth, the fanaticism of the SYMBOL, or of creeds, dogmatism, and ecclesiastical virulence."

Whoever wishes to contemplate human nature under its most degraded forms, has only to trace fanaticism in its progress, as the malignant perverter of all that is good, and the demon-like perpetrator of crimes which, but for its ingenious and detestable cruelty, would never have been known among men. We remember, years ago, the reverend Momus of the Edinburgh Review diverting himself and his readers at the expense of the self-indictions and immolations of the poor idolaters of Hindostan. It was to him a merry spectacle, to see the victims of this revolting fanaticism, swinging in cages suspended in the air under a vertical sun, lacerated by knives, and hanging from the trees by hooks inserted in their flesh, because it was on their part voluntary—because they had the power at any time of relieving themselves. But, in our view, this is the very circumstance which deepens the whole scene with horror. What a terrible principle must that be which wildly hurries men into extravagances like these—which makes them their own tormentors and murderers!

In developing this principle our author tells us

that there are three distinct elements upon which fanatical sentiment employs itself; and in each instance the product is very distinguishable. There are, first, the miseries, physical and mental to which man is liable; 2nd, a consciousness of personal guilt and dread of retribution; and, 3rd, the supposition of supererogatory or vicarious merit. With regard to the first, the fanatic reasons thus. "If pain, sorrow, and want are to be my companions, I vow to have none beside: I will run forward and embrace wretchedness: I will live for misery, so that she may never overtake me or set me as the mark of her arrow. Disappointment shall for me hold no shaft which I will not have wrenched from her cruel hand, ere it can be hurled. The power of bodily pain shall have no anguish in store which I will not freely have forestalled. Famine, thirst, heat, and cold, shall assail me with no new lesson of distress: no; for I will frequent their school. Every pang the flesh or the heart can feel I will prevent by existing only for sorrow. Even that unknown futurity of evil which death may reveal, I will penetrate by continual meditation of horrors. So will I daily converse with ghostly despair, as to taste beforehand the very worst, and to nullify fear by familiarity."

Language like this may read like the very extravagance of madness, and perhaps the modes of feeling which it implies can only be produced so as to justify the full energy of the expressions, by the fanaticism which attributes malign power to the Deity, and trembles before him under a consciousness of guilt and dread of retribution. Misery is not chosen, in the first instance, for its own sake; but as it is inevitable, and the infliction of vindictive power, it is embraced, and the victim takes the scourge from the hand of the Deity, and lashes himself with tenfold fury, in order that he may appease the wrath which he dreads, obtain the favour of a Being who has at his command such tremendous spirits of vengeance; and at last, by a merit derived from supererogatory sorrow, secure heaven not only for himself but for others. "The fanaticism of personal infliction is not ripened until it approaches this latter point. That is to say, it wants spring and warmth. It has no heroism so long as mere dread and the sense of guilt are uppermost in the mind; but when pride takes its high standing, upon the supposition of merit won, and when invisible powers are deemed to have been foiled, then the spirit gets freedom and soars. Pitiable triumph of the lacerated heart, that thus vaunts itself in miseries as useless as they are horrid!" Must we not mourn the infatuations of our nature, as we watch the ascent of the soul that climbs the sky only to carry there a sullen defiance of eternal justice! So the bird of prey, beat off from the fold, and torn with the shepherd's shafts, its plumage ruffled, and stained with gore, flaps the wing on high, and fronts the sun, as if to boast before heaven of its audacity and its wounds.

This is human nature in its lowest grade of guilt and wretchedness; yet even in this its state of utter degradation, there is afforded a glimmering of its original grandeur. "After we have scoffed at the folly, or wondered at the infatuation of the voluntary sufferer, let us return and ask, whether so strange a perversion of the power of the spirit over the body does not furnish evidence of an overthrown greatness in the human mind, such as the atheist and sceptic quite leave out of their theory of man? If it be said that these witless personal inflictions take place in consequence only of an error of belief, and may properly be compared to the ill-directed fatigues of a traveller who, on wrong information, pursues a worse road when he might have found a better; let only the experiment be tried, of leading into a parallel error any being to whom the body and its welfare is the supreme and only interest to be cared for; not a step would ever

be set by such a being towards a folly of this order. The liability of man to go so far astray springs from those ulterior principles that are involved in his nature, and which bespeak an immortal destiny."

This it is that renders the superior powers of the soul, when brought under a malignant influence, so peculiarly fatal to the happiness of the individual and society. For he that so unnaturally turns his vindictive propensities against himself, becomes utterly regardless of the miseries of his fellow-creatures: nay, he riots in them, and they minister to the only enjoyment of which his heart is susceptible. If his creed is the dictate of a ferocious superstition, he obeys its mandates with a joy which is exactly proportioned to the sufferings which he inflicts, and the brand, the rack, the torture, and the flames he delights to employ against all who differ from his faith, or dare to question his infallibility. When the religion is confessedly divine in its origin, and merciful in its character, which seizes upon his imagination and controls his destiny, the fanatic contrives to extract from it the very essence of malignity, and his ingenious inventions to torment the schismatic and the heretic are multiplied with the evidences which sustain the truth of the system which he has strangely perverted into the elements of a demoniacal malevolence.

Thus the dogmas of the Church of Rome, acting upon the worst passions of human nature, are justly chargeable with having immolated more victims, and by a process of infliction infinitely more terrible than all the other persecuting religions that have ever obtained among men. This pre-eminence in crime, as attributable to the Romish superstition, the author before us has irrefragably established. "What modern heart," he exclaims, "would not leap with fear if it were permitted to us for an hour to step back from the nineteenth century to the age of Vespasian, and to push our way into the theatre of imperial and popular diversions, just when the gladiator was about to die for the sport of a philosophic prince, and of sumptuous citizens; or when hungry beasts were to be glutted with the warm flesh of the nobility of a conquered kingdom! And yet the ancient Roman theatre, with its mere sprinkling of blood, and its momentary pangs and shrieks, quite fades, if brought into comparison with that coliseum of papal cruelty, in which not a hundred or two of victims, but myriads of people—yes, nations entire—have been gorged! If we must shrink back, as assuredly we should from the first spectacle, we shudder even to think of the other. Though it were possible to summon courage enough to gaze upon the mortal, yet equal conflict of man with man in the theatre, how shall we contemplate torments and burnings inflicted by the strong upon the weak; or if we might endure to see the lion and the panther spring upon their prey, could we force ourselves to the far more horrid sight, when the priest and the friar, athirst for their blood, were to rush upon men, women, and babes."

The writer then proceeds to contrast the cruelties of the Druidical, Scythian, and Indian idolaters, with the incomparable example of religious ferocity supplied by the Roman hierarchy. "Superstition," he adds, "does indeed tend to blood, and often is guilty of it; but fanaticism, fanaticism such as that displayed by the church of Rome, breathes revenge, and murder beats from its heart."

Compared even with the horrors under which Christians suffered during the first three centuries, from the pagan predecessors of the popes, on the seven hills, the latter appear insignificant. This the author has proved to the satisfaction, we think, of every man who will follow him in the clear statements which he has made, and who is able to form any thing like a competent judgment on the question. The fanaticism of the banner

and the symbol, the one aiming at conquest, and the subjugation of the world to a particular ecclesiastical despotism, the other assuming all the characteristics of an intolerant and systematic bigotry, contending for dogmas and opinions with an equable and remorseless fury, as if resolved that the human race shall be exterminated, or this particular order of belief, universally established, opens to us a wide field of speculation. We cannot enter upon it. Every where it unfolds a mournful, nay, an appalling exhibition of the fall and misery of man; and would seem to impress us with the conviction, that nothing in the form of religion can restore him: but that even mercy, the religion of redeeming love, with all its divine charities and healing influences, when brought into contact with human depravity, instead of softening and humanizing the heart, eradicates and destroys its best sensibilities, while it only inflames and aggravates the darker passions, and brings them out into fearful action, making man the destroyer of himself and of his species. Of course this is a conclusion which a little reflection must repudiate. Christianity has no such tendency; and the most triumphant portion of the present work is, that in which the writer meets this formidable objection against the religion of the Bible.

The diffusion of just views of the character of the Divine Being, as he has condescended to reveal the principles of his moral government in the Holy Scriptures, is directly at variance with every species of fanaticism. As opposed to turbulent and malignant emotion, it is altogether calm and passionless. Its element is love. Fanaticism, be it observed, as springing from spurious and exaggerated ideas of Christian doctrine, could never have produced any very considerable amount of evil, had it not allied itself with worldly power, and nerved the secular arm in support of its detestable murders and massacres. If the governments of the earth had left religion to itself, and suffered theologians to maintain nothing more than a wordy controversy, we should have had logomachies in abundance but no persecutions. It is a curious question how far fanaticism has availed itself of worldly power to accomplish its nefarious objects, and how far worldly power has employed fanaticism to perpetuate and extend its domination. But history has shown that in the end, fanaticism is always dangerous to states. If at any time it puts on the garb of an obsequious slave it is only that it may compel the world's masters to assist in its works of darkness, that in the end it may assume the triple crown, or some other badge of supreme authority, for the purpose of laying thrones and monarchies prostrate at its feet. In the present day we have nothing to apprehend from churches, whether established or tolerated, while the diffusion of general knowledge corrects the bigotry and extravagance of the pulpit. But if alarm be at all reasonable, it ought to separate us from those who put on a kind of patent sanctity, who deal damnation round the land, and who by one sweeping anathema, consign to perdition all who are not members of their own communion. This is the most dangerous of all heresies; from which, and all its tendencies, all true Christians should pray, "Good Lord deliver us." But in order to this, perhaps it will be necessary to construct a new liturgy; at least we must expunge from the present, the clause which assures us, that if a man believe not the doctrine of the Trinity, according to a human explication, "without doubt he shall perish everlastingly."

It is our intention to analyze, after the manner of this article the most important and valuable works of the day.

Mr. Taylor's last production, the "Physical Theory of another Life," we shall thus lay before our readers as soon as we have time to do it justice.

THE REVIEWER'S TABLE.

[Under this general title we propose to give a very brief character of books which may demand attention, but which the want of room, or the claims of other topics, may not allow us to review at length. We shall not be at the pains of clearing our table every week, but we will endeavour to do it as often as its weighty contents may require.]

Dunn's Christian Theology for every day in the year is carefully selected from 365 religious writers, is well arranged, and contains many beautiful passages.

Jones's Spartacus, a Tragedy, is written for the stage, and therefore not "in our line of things." We neither think it fit for the stage, nor the stage fit for it.

Philip's Lydias; or the Development of Female Character, forms a portion of his "Lady's Closet Li-

brary." It displays ingenuity, and breathes a pious spirit.

The Outcast is one of the thousand poems which please only the immediate connexions of their author, and which even they cast out before they have read to the end of it.

Belcher's Pastoral Recollections convey instruction of the most important kind in a pleasing manner. Interesting facts, and events which discover the hand of Providence, and unfold the character of sanctified human nature under the process of trial and preparation for a brighter world, as well as incidents which tell upon the heart of sensibility, are here detailed with great pathos and simplicity.

SCENES FROM HOME.

PRAYERS AT SEA.—We were now sixteen days from Callao, (says Stewart in his visit to the South Seas,) without any incident worthy of notice. Having run the whole distance in the full strength of the south-east trade winds, and directly in their course, we have had a breeze unceasingly fresh and fair, with all the inconvenience of rolling so heavily before it as to have been denied, to a great degree, every profitable occupation of time, even that of reading with comfort. Yesterday was our Sabbath. The only difference in the mode of performing religious service here, and on board the *Guerriere*, is in the signal used in assembling the crew. Instead of the boatswain's pipe, followed by the hoarse call around the decks, "all hands to prayers, ahoy!" as the bell strikes the time, the Portuguese hymn, from the band, breathes to every heart, in sweet and solemnising strains, the welcome invitation,

"O come and let us worship;"

while, from all parts of the ship, we silently obey its impressive call. My desk is the capstan, spread with the American ensign, beside which I stand mounted on a shot-box, to secure the elevation of a foot or two above my audience.

THE FIRST SABBATH IN A NEW SETTLEMENT.—In 1819 it was resolved by the government that about five thousand new settlers should be sent to the Cape of Good Hope. The first party, to which the late Thomas Pringle and many of his Scottish friends were attached, reached the colony in the early part of the following year. These emigrants journeyed some hundreds of miles from Cape Town to the location assigned to them. On a Saturday evening, they unyoked in a valley which they resolved to name *Glen-Lynden*. The ensuing day, their first peaceful Sunday, is thus described by Mr. Pringle in his *African Sketches*:—"Having selected one of the hymns of our national church, all united in singing it to one of the old pathetic melodies with which it is usually conjoined in the Sabbath worship of our native land. The day was bright and still, and the voice of psalms rose with a sweet and touching solemnity among those wild mountains, where the praise of the true God had never, in all human probability, been sung before. The words of the hymn (composed by Logan) were appropriate to our situation, and affected some of our congregation very sensibly:—

O God of Bethel! by whose hand
Thy people still are fed;
Who through this weary pilgrimage
Hast all our fathers led.
Through each perplexing path of life
Our wandering footsteps guide;
Give us each day our daily bread,
And raiment fit provide:—
O spread thy covering wings around
Till all our wanderings cease,
And at our Father's lov'd abode
Our souls arrive in peace.

While we were singing, an antelope, (oribi,) which appeared to have wandered down the valley without observing us, stood for a little while on the opposite side of the rivulet, gazing at us in innocent amazement, as if yet unacquainted with man, the great destroyer. On this day of peace, it was, of course, permitted to depart unmolested."

A LEPER.—A day or two after our arrival at Bombay, says a writer in the *Oriental Annual*, I was strolling, about sunset, on a beach of Colaba, a small island, separated from Bombay, only when the tide rises, by a narrow creek, the passage being perfectly dry at low water, when my attention was arrested by a peculiar object. A man approached me in the costume of the lowest orders, having only a cloth wrapped round his loins. I could not help being forcibly attracted by his appearance. His skin was perfectly white, as white as chalk; and when he came near me I perceived that it seemed glazed, as if it had been seared by a hot iron. His hair, for he wore no turban, was precisely the colour of his skin, and hung in long strips upon his lean and withered shoulders: his eyes, excepting only the pupils, were of a dull, murky red, and he directed them perpetually towards the ground, as if the light was painful to him, which, upon inquiry, I discovered to be the case: his gait was slow and tottering, and his limbs were shrunk to a state of attenuation quite ghastly. His ribs were so prominent that they might be counted at the distance of several yards, and the whole anatomical development was so singularly conspicuous, that it seemed to stand before me a living skeleton. He did not at first venture to approach within several yards of me. I advanced, but he gently retreated, beseeching me to give a miserable man a few pieces to save him from death, as he was an object of universal scorn, and an outcast from his tribe. His supplication was piteously imploring. He bid me not come near him, as he was a polluted creature, against whom the hand of every one was raised, and for whom there was no pity. By speaking kindly to him, I in a short time obtained his confidence, when he stood still and allowed me to stand close beside him. I asked him the reason of his extraordinary appearance. He told me that he had been for years a martyr to the leprosy, which, though at length cured, had left upon him the brand of irremediable pollution. The very hue of his skin had changed from a brown to a cadaverous and sickly white, and no one could mistake that he had been a leper. In India, lepers are held to be accursed of the Deity: they are in consequence universally shunned, and many yearly die in an abject state of destitution truly deplorable, from the universal abandonment to which their dreadful visitation exposes them. Though the poor man was of the lowest caste, none of the members of his tribe would hold intercourse with him; and he was cast forth a wanderer, where he could find none, but such as were

labouring under a similar infiction, who felt any sympathy in his wretchedness. Nothing can be more melancholy than the thought of a human creature so situated. Not only an outcast from general society, but shunned even by the most degraded of his tribe, he has no home but such as he makes for himself, apart from the haunts of men, who frequently drive him into the jungles, where he becomes a prey to the wild beasts; or where he refuses to withdraw himself beyond the remotest neighbourhood of human habitation, in violation of every law both human and divine, the members of his own family will frequently put the wretched creature to a cruel death.

THE PENITENT SLAVE.—A traveller who was riding through a forest in Virginia on horseback, thinking he heard a human voice, rode towards the thicket whence it seemed to proceed. When sufficiently near, he overheard a voice, though he could discern no object; he only caught the words, "O Lord, look down, see poor nigger; him heart as black as skin—dear Lord Jesus came all way down to save poor nigger."

Here the horse snorted, and alarmed the black. He raised himself a little, and cried out beseechingly, "Oh, no whippie poor nigger."

Mr. S.—What were you doing?

Slave.—Praying to God?

Mr. S.—What for?

Slave.—Me poor nigger: sinner black heart, black as skin: me come to wood pray God save me.

Mr. S.—Boy, I pray to the same God.

Slave.—Do you?

Mr. S.—Yes, and will pray with you.

Slave.—(falling flat on his face)—Oh do, Massa, and kneel upon poor nigger.

Mr. Smith immediately knelt down, but, as it will be readily conceived, not upon him, but by his side; and thus they both worshipped together Him who made of one blood all nations of men, to dwell on all the face of the earth, and who by one and the same precious blood will wash away the equally offensive stain of sin upon the white man and the black.—*Cox and Hoty's Baptists in America.*

A MAHOMETAN SERMON.—"I once had," says Mr. Uplike Underhill, an American, who was long a captive in Algiers, "an opportunity of approaching, unnoticed, the window of one of the principal mosques. After the customary prayers, the priest pronounced the following discourse with a dignified elocution. It was received by his audience with great reverence. It may, undoubtedly, suffer from translation, and the fickleness of my memory; but the manner in which it was delivered, and the energy of many of the expressions, made so strong an impression, that I think I have not materially varied from the sentiment.—The attributes of the Deity were the subject of the priest's discourse; and, after some exordium, he elevated his voice, and exclaimed—

GOD ALONE IS IMMORTAL!—Ibrahim and Soliman have slept with their fathers; Cadijah, the first-born of faith; Ayesha, the beloved; Omar, the meek;

Omri, the benevolent; the companions of the apostle, and the sct of God himself, all died; but God most high, most holy, liveth for ever. Infinities are to him as the numerals of arithmetic to the sons of Adam; the earth shall vanish before the decrees of his eternal destiny; but he liveth and reigneth for ever.

GOD ALONE IS OMNISCIENT!—Michael, whose wings are full of eyes, is blind before him. The dark night is unto him as the rays of the morning; for he noticeth the creeping of the small pismire, in the dark night, upon the black stone, and apprehendeth the motion of an atom in the open air.

GOD ALONE IS OMNIPRESENT!—He toucheth the immensity of space as a point; he moveth in the depth of the ocean, and Mount Atlas is hidden by the sole of his foot; he breatheth fragrant odours to cheer the blessed in Paradise, and enliveneth the pallid flame in the profoundest hell.

GOD ALONE IS OMNIPOTENT!—He thought, and worlds were created; he frowneth, and they dissolve into thin smoke; he smileth, and the torments of the damned are suspended. The thunderings of Hermon are the whisperings of his voice; the rustling of his attire causeth lightning and an earthquake; and with the shadow of his garment he blotteth out the sun.

GOD ALONE IS MERCIFUL!—When he forged his immutable decrees on the anvil of eternal wisdom, he tempered the miseries of the race of Ismael in the fountains of pity.—When he laid the foundations of the world, he cast a look of benevolence into the abyss of futurity, and the adamantine pillars of eternal justice were softened by the beamings of his eyes. He dropped a tear upon the embryo miseries of unborn man, and that tear, falling through the immeasurable lapses of time, shall quench the glowing flames of the bottomless pit. He sent his prophet into the world to enlighten the darkness of the tribes, and hath prepared the pavilions of the houri for the repose of the true believers.

GOD ALONE IS JUST!—He chains the latent cause to the distant event, and binds them both immutably fast to the fitness of things. He decreed the unbeliever to wander amid the whirlwind of error, and suited his soul to future torment. He promulgated the ineffable creed; and the germs of countless souls of believers, which existed in the contemplation of the Deity, expanded at the sound. His justice refresheth the faithful, while the damned spirits confess it in despair.

GOD ALONE IS ONE!—Ibrahim the faithful knew it! Moses declared it amidst the thunderings of Sinai; Jesus pronounced it; and the messenger of God, the sword of his vengeance, filled the world with that immutable truth.

• Surely there is **ONE GOD, IMMORTAL, OMNISCIENT, OMNIPRESENT, OMNIPOTENT, most MERCIFUL and JUST;** and Mahomet is his apostle.

Lift your hands to the Eternal, and pronounce the ineffable, adorable creed: **THERE IS ONE GOD, AND MAHOMET IS HIS PROPHET.**

GEMS.

PREJUDICE.—Prejudice may be compared to a misty morning in October; a man goes forth to an eminence; he sees at the summit of a neighbouring hill a figure, apparently of gigantic stature, for such the imperfect medium through which he is viewed would make him appear; he goes forward a few steps, and the figure advances towards him; the size lessens as they approach; they draw still nearer, and the extraordinary appearance is gradually but sensibly diminished; at last they meet, and perhaps the person he had taken for a monster proves to be his own brother.

TEMPERANCE.—The quiet and safety that are found in solitude and retirement from the world, may be equally enjoyed by us, though in it, provided that we keep strictly to the medium of temperance, and confine our wants to what nature exacts for its preservation, which is common and easily to be procured. In effect, whatever she counts most delicious and exquisite is common and limited; but if we listen to the unlimited appetites opinion creates when it is deceived by false appearances, our luxury will be insatiable, and nothing will be able to satisfy it.

THE SALMON FISHER.

A TALE.

CHAPTER I.

"A melancholy man——"

That loved, unseen, beneath some shelt'ring cliff,
 To sit as one whose brightest thoughts were drown'd
 With the wreck'd joy of forgotten days."

OLD PLAY.

FREQUENTLY on my journey to Inverness, in passing an almost desolate glen of cliffs, near the borders of Murray Frith, I had observed a solitary cabin in the bosom of this retired and romantic spot. There was a stormy grandeur, a wild and captivating sublimity in the scene, which always drew me towards it, and induced me to pass that way, although considerably from the main road. Often as I paused to gaze with emotions of untold delight on the picturesque beauties which the pencil of Nature had here sketched, I imagined this little lonely dwelling the habitation of some melancholy being, who, like myself, valued more the seclusion afforded by those shapeless rocks, than all the pomp and pageantry of the world. Why I entertained such ideas I am at a loss to imagine, they must have been created by the influence of the prospect on my own romantic imagination. One morning I came earlier than usual to my favourite haunt; the sun's golden beams had scarcely tinged the white foaming waters of the Frith; I ascended an eminence, where unseen I could distinctly observe the fishermen, with their nets loosely flung across their arms, entering their rude barks, and piloting them along the flood; even when the joyous tones of their matin songs were for a time distinguishable, till they either died away in distance, or became lost in the hoarser murmurs of the breakers' roar. "Ah," thought I, "on these banks there is nothing but peace; it is only in retirements like this that true happiness is to be found. These simple fishermen are strangers to the cares and calamities which dwell beneath the gilded domes of kings, and enter the crowded assemblies of the great. Their's is a golden age; their employment is an invaluable mine, from which they not only extract the means of existence, but the objects that alone can render it desirable—health and vigour." Thus musing I almost conceived myself a fisherman, and had fashioned a little world of uninterrupted felicity, peopled with creatures of my own dispositions and my own sympathies. I began to consider, that the desolate cabin, which had hitherto shown no sign of being tenanted, would form a delightful hermitage; and mechanically directing my eyes towards the declivity on which it hung, how was I astonished at beholding a figure, totally unlike the inhabitants of the adjoining hamlet, slowly emerging from its narrow door! Curiosity induced me minutely to observe him. He was

[No. 8. FEB. 22, 1837.—2d.] VOL. I.

above the common height, moved with a majestic step, and possessed an air infinitely superior to the generality of salmon fishers. His dress was composed of coarse grey cloth, over which he wore a plaid, thrown with a careless grace across one shoulder, and almost sweeping the ground with its long folds; he had on a bonnet also, fashioned like those of his neighbours, from which a profusion of long black tresses escaped, and, wafted by the breeze, mingled themselves with the descending ringlets of his unshorn beard. The winding path by which he descended (with his eyes bent upon the earth, his hands clasped in each other, and his whole frame wrapped as it were in the deepest rumination) conducted him past the angle, behind whose extremity I was standing. There was a pale dignity in his features—a grief not to be expressed; which at once put to flight my supposition that this solitude was the abode of unalloyed tranquillity. Never had I beheld such an expression of intense feeling as the countenance of this stranger exhibited; it was too evidently the index of a great mind sinking beneath a weight of overwhelming sorrow. Partially concealed by the jutting rock, he passed me unobserved, and turning abruptly under some shelvings of the height, suddenly disappeared. A feeling of the most powerful interest, excited possibly by the singularity of his appearance, induced me to follow at a distance his footsteps. In a few moments he reached the banks of the Frith, and seated himself on a fragment of rock, his feet almost touching the water; of which he evidently remained unconscious. By a scattered net extending from his listless hand, I had no doubt but his occupation was that of a salmon fisher, however he might refrain from mingling in the society of a class of men whose boisterous habits, I was willing enough to believe, were materially at variance with his own.

It appeared a singular circumstance to me, that any species of misfortune should be capable of throwing such a degree of dignity over a man, as totally to distinguish him from his companions. I felt an ardent desire to become acquainted with the object of my surprise. My heart dictated, that perhaps my hand might afford the means of mitigating his too visible sufferings, although I scarcely could prevail upon myself to suppose that those sufferings were other than mental ones, only to be alleviated by the hand of Heaven. At this instant two of the other fishermen approached him, but with a courtesy quite unlike that which I knew they accustomed themselves to practise towards each

other. He too seemed to shake off his abstraction, and with an unexpected cheerfulness accompanied them to their boat, and aided them in their employment and exertions. I followed their course with my eyes to a considerable distance, and in the course of my excursion through the glen, called at the cabin of an old peasant, to whose infirmities I was in the habit of administering pecuniary aid; when in reply to my inquiries concerning the peasant for whom I was so strangely interested, he informed me that his real name was as much unknown to the inhabitants of the place as myself. It appeared, by an indistinct account, that he had been almost shipwrecked in the western ocean; but with a part of the crew, and a lady supposed to be his wife or daughter, had effected his escape on a raft. He had abandoned his seafaring brethren, and accompanied only by his female partner, wandered as far as the little cabin in this glen; which, from its unfrequented stillness, seemed best suited to his wishes, as he immediately fixed on it for a residence. Of his fair companion in seclusion I could gather nothing: it was seldom she appeared abroad, and seldom addressed herself either to the fishermen or their wives. Sometimes, indeed, they had been noticed like lovers slowly rambling along the sides of the craigs by moonlight; and often, during the calm of evening, the sounds of music were heard from the rock on which they were known often to seat themselves.

Among the fishermen, the stranger was distinguished by the title of Rholf; with them he was considered serious, but not melancholy; and they respected him not more as a superior being to themselves than for that kindness of heart he had on several occasions displayed.

What I heard, added to what I had seen, convinced me still more, that the person whose secret grief I had so undesignedly witnessed, was far above the rank of a salmon fisher; nor could I cease to dwell upon the deep impression his looks and situation had made upon my mind. I felt an insurmountable desire to effect an interview with him, and to make a tender of my services; but feared that any intrusion on my part might be considered as the efforts of impertinent curiosity. With these reflections passing in my breast I arrived at the extremity of the glen, from which it was necessary to cross a ferry, in order to join my servant, who waited my return at a small public house at no great distance. The boat had glided about half way from the shore, when by some accident it upset, and plunged both the ferryman and myself into the water. In a few moments my luckier navigator succeeded in effecting his escape; and I, who was a tolerably expert swimmer, should have done the same had not the belt of my game bag, by escaping from my shoulder, twisted itself about my feet in such a manner as to render me

almost incapable of exertion; and as I a second time ascended, firmly adhered to the ruins of an old bridge which lay concealed at the bottom of the river. In vain for a time did I struggle—my strength began to subside in ineffectual writhings—the power of my exertions was not equal to the cruel bond that held me—I felt that I must perish, and abandoned myself for lost. My senses already began to be disordered; a violent oppression seized my brain; and a sort of chaos came over my mind, which not only extinguished reason, but every sense of danger likewise.

The earliest dawn of existence that again kindled in my breast was accompanied by a sensation of deep distress, more painful, more trying, than the actual combat between life and death. In the latter case, the expiring throes became gradually weaker and less painful; in the former, those of reanimation were each time stronger and more torturing: indeed my sufferings were so material after the still serenity I had attained, that I was at first very far from blessing the hand which had roused me from it. By degrees the new glow of life took firm possession of my frame.

The first object that met my view, was the person of my own servant, bending over me and chafing my temples. I found myself to be in some small apartment, which could not belong to any common individual, for the walls were not only neatly matted, but adorned with a variety of foreign prints, the beauty and value of which would have been perfectly unknown among the salmon fishers. The bed, too, on which I was extended, was of the neatest and finest order, and furnished with curtains, a luxury unknown in this secluded glen. The heavy sighs at intervals escaping from my lips, and the wild glance with which at length I observed both his features and the different objects around, convinced Donald that I was fast recovering; and, in a low voice, he said something to a figure at the back of my pillow, which, from the elevated situation of my head, I could not clearly distinguish till it came gently forward, and drawing aside the drapery at the foot of the bed, gazed anxiously and fully upon me. That countenance had been too well perused in the morning not to be instantly recognised.—It was Rholf, the mysterious salmon fisher.

"Ye did'na ken he wad ha' lived just now," said Donald, with an air of honest exultation, arising probably from the realization of his own hopes. The stranger lifted his eyes to heaven with a look of strongest emotion.

"God," he exclaimed, "that you have rendered me the humble instrument of *preserving* a fellow-creature, is a blessing of which I am too unworthy."

His lips quivered as he uttered this simple sentence; the peculiar emphasis with which he articulated the word, *preserving*, thrilled me.

A SCOTTISH SABBATH.

CHAPTER III.

IN most of the country parishes of Scotland, where the population is rather dense, and the parish not of very great dimensions, the bell is tolled three times on the morning of the Sabbath; but there are some parishes of such ample breadth, and with the population so thinly scattered, that the loudest discharge of artillery which could be made would not reach the half of the people, and therefore the tinkle of a small bell would be of no avail whatever. "The first bell" is understood to call the people to their family devotion, or to make them prepare for going to the place of worship; or, at all events, this is the understanding they have of it, which amounts to nearly the same. "The second bell" is intended to make them begin their journey churchward; but that journey is begun before, at, or after the tolling of the bell, according to the distance; for the distance is one of regular weekly measurement, and thus they are at no loss to judge of the time necessary for performing it, at that slow and measured pace which accords with the quiet, and solemn character, and observance of the day.

Unless the day is very inclement, or some of the people are of that class of society to which fashion nearly proscribes the use of their limbs, the whole come to the church on foot. Their march is, as we have said, slow; and as they are decked out in their best attire, and many of the paths are footways in the fields, or, at all events, roads not concealed by hedges, they present a very agreeable sight; and as the lines which are advancing along the different paths converge toward the place of their destination, they put one in mind of the living streams from many hills, pouring their waters into some stilly, transparent, and healthful lake, whose pure waters and uniform temperature tend to mitigate the extremes of all the seasons, and render the whole circle of the twelve months, to some extent or other, both pleasing and fertile.

The comparison suggested here is not a bad one: for "the assembling of themselves together," regularly as the Sabbath-day comes round, has a most happy effect in allaying even the first stirrings of the turbulent passions in these rustics, and making them hold on "the even tenour of their way" in a manner worthy of imitation where the population is more crowded, and the hearts and intellects of men are higher and more varied.

The boys, who have come to church for the first time, which they seldom do till they are able to repeat the text and a note of the sermon extempore on their return, and to look up and read the chapter containing the text, as an evening lesson, or the foundation of a simple family lecture by the father, or the master, as it happens, are generally the first to arrive. But old heads cannot be put on young shoulders, and perhaps

it is as well that they cannot. There are other attractions for them. The "kirk-stile," or principal entrance to the churchyard, is sometimes a gateway of stone, rudely hewn by the men of a former age, and bearing some such inscription as this,—

Heare ye wearis are att rest.

Then there are the angels, the implements of trade, and the prose and verse, on the upright stones; all very interesting to such youthful admirers of art.

I myself have gone many times to ponder, in wondering though melancholy meditation, over a recumbent skeleton with an angel blowing a trumpet at each ear, and thought I had seen the noblest work of art in the wide world. I was drawn by the force of the clinging and brilliant recollection to visit it many years after; and I wish I had left it alone, for the beauty of the vision had fled, and 'oh, what a mangling of form and proportion!

If there happen to be a hearse, which is, or which used to be, the case only in rich parishes, it is a great attraction. It is usually in the shelter of a windowless house, no larger than just to hold it, and it is dimly seen through the sparsely gates in front, which are black, and spotted with huge bars of white. The vehicle is also black; but there are sundry emblems most rudely limned upon it, which draw the mingled awe and wonder of the gazers, and put their erudition to a task for which it is, generally speaking, unable. The cherubs, with nothing but head and wings, are easily understood. The hour-glass is also in part made out; for most of them have seen an hour-glass. But this one has wings, of which they cannot see the use, as there are no other winged hour-glasses in the parish, and the wings of their own hours, as yet, have only down upon them, not pinions. The *fugit hora*, seals the mystery of that emblazonment. Still more perplexity attends the next, however. The skull, the cross-bones, and the *memento mori*, are each more perplexing than the other; and as fear follows fast on the footsteps of ignorance, especially in twilight times or twilight places, they retire in silence from this last emblem of the hearse.

By the time that the juveniles have seen all the sights, and have been worked into becoming solemnity in the way that has been mentioned, the adult part of the congregation have arrived, exchanged their salutations, and are ready for the commencement of the service. The "be-thell," or beadle, though his office is very different from that of an English beadle, acts as observer for the minister upon such occasions.

If it is the ordinary congregation, an ordinary sermon will do, as the people are more interested in the worship than in the words. But it sometimes happens that an "unknown" is there, in more fashionable, though not cleaner, attire than the ordinary hearers, and this never fails in sending the minister to the pet pigeon-hole of his *escrutoire*, thence to cull one of his very best; and if you stand apart, and show yourself in a manner conspicuous enough, the sermon you shall have will be all the better.

As soon as the "bethell" has reported "stranger," or "no stranger," as the case may be, he goes to the rope and tinkles the "in-ringing" bell. The people begin to enter the church as the bell begins; and it continues till they have all entered the porches or doorways. A door in each end, or one near each end, in the front, is the usual ingress and egress for the congregation. The pulpit is usually against the middle of the south wall, between two windows; and to your right of it there is often "the minister's door, a small wicket, which does not communicate directly with the body of the church. The desk, for the leader of the psalmody, or the "letterin'," as it is locally called, is under the pulpit in front, and about two thirds of the height of that from the floor. Another third below this there is a railed platform, from which those who bring children to church to be baptized present them to the minister, but on ordinary occasions it serves as a seat for the aged, whose eyes have become dim and their ears dull. There is a stair leading from this to the floor of the church, and the steps of this are, upon ordinary occasions, filled with the same aged people as the platform above. At the lower landing of the stair there is usually a square pew, which in ordinary contains the "best voices," where the psalmody is given in parts; and the elders, and ministers in waiting at the sacrament of the supper. If the place is modern, a row of square boxes extend along the middle, so as to be convertible into communion tables by removing the partitions; and, with the exception of a square box under the pulpit at each side, the rest is filled with pews, but without any provision for kneeling, which is never used in the church service in Scotland, and without any elevated parts to hide the sitters. A modern gallery has its front four sides of an octagon; but the ancient ones are of no definite form. There sometimes is what is called an "aisle" in the old-fashioned places, but it is generally opposite the pulpit, and has more the plan and form of a transept. The very old ones have still the iron frame for the hour-glass, attached to the "letter-in," it being part of the duty of the precentor to turn the glass, and lay it on its side on the forks when the minister outran the stipulated tale of glasses; but modern structures have generally a dial in the middle of the front of the gallery, and modern preachers are not quite so lengthy as

those of the olden time. There are very seldom any mural or other monuments inside the church to attract your attention, on entering, or distract it during the sermon; and perhaps they are just as well away. When frail and fallen men approach the footstool of the throne of their God, in those solemn exercises which he has appointed, it may very gravely be doubted whether emblems of human pomp, and specimens of the sculptor's art, are the most appropriate of all accompaniments. The Scotch have two objections to burying in churches. In the first place, they look upon all consecration of places as mere mockery; and, in the second place, they do not consider that interment under a church can, in any way, be conducive to the health of the living.

The minister enters by his little wicket, slowly mounts the steps, and seats himself at the back of the pulpit, looking round the congregation to see if all are there as usual; and Dr. Bryce, whom we shall suppose you are about to hear, never addressed empty pews, either in his own church or any other, if his presence there happened to be known. He was a man considerably above the middle stature, and beyond the middle age; but he was still young in mind and heart, and even in the colour and expression of his countenance. It was a common remark that, "nobody became a pulpit better than Dr. Bryce," and the saying was true. Mildness, or rather perfect repose, and a feeling of peace with all in heaven, and goodwill to all upon earth, was the predominating expression; but there was a light in the eyes, a depth of enforcements in the eyebrows, and a firmness in the character of the mouth, which showed that if his duty required it, Dr. Bryce could wield the terror of the law. The day was warm; so that he had not on even the simple canonicals—the plain black gown and the Geneva band.

He took the psalm-book from the "book-board" of the pulpit, and began to turn the leaves. He rose: "Let us begin the public worship of our God, by singing to his praise a part of the twenty-third Scripture hymn, from the beginning." He paused, till the people should find the place in their books. The psalm, or hymn, is not unfrequently a key to the sermon; and thus there were nods of inquiry, answered by nods of approbation, in various parts of the church. When all had found the place, he read, slowly, and in a full and deep key, but with peculiarly mellifluous intonation. His voice was just what that of a preacher of the Gospel should be—solemn, but sweetly solemn. It used to be said, that the people of Glengowan parish read better than others, for they learned from Dr. Bryce in the pulpit. He read—

"Behold my servant! see him rise
Exalted in my might!
Him have I chosen, and in him
I place supreme delight.

" On him, in rich effusion poured,
My spirit shall descend;
My truths and judgments he shall show
To earth's remotest end.

" Gentle and still shall be his voice,
No threats from him proceed;
The smoking flax he will not quench,
Nor break the bruised reed.

" The feeble spark to flames he'll raise;
The weak he'll not despise;
Judgment he shall bring forth to truth,
And make the fallen rise.

" The progress of his zeal and power
Shall never know decline,
Till foreign lands and distant isles
Receive the law divine."

To what an exceedingly high mountain of prophecy must the spirit of the Lord have carried the son of Amos, when he poured forth that clear and graphic delineation of the coming and ministry of the Saviour, which is given in the first twelve verses of the chapter of which four are versified in the above quotation. No translation can catch the glowing spirit of the original; and no versification, trammelled with rhyme, can come up to the abrupt and inspiring energy of the prose translation. But Dr. Bryce made the reading tell most powerfully on his congregation; and one could not help feeling how tamely the versicles by rote, and the peal of the organ, move the soul to devotion, as compared to the judicious reading of an appropriate hymn.

The earnest call of attention—"Behold my servant—mine elect." The endowment—"I have put my spirit upon him." The promised work—"He shall bring forth judgment to the Gentiles." This promise is full, free, and general as the light of the sun, or as God's providential care of all that he has made—a beautiful embodiment of "the glorious liberty" of the Gospel. Then the mildness of his procedure, and his tenderness to the feeble—"He shall not cry, nor lift up, nor cause his voice to be heard in the streets." Lastly, the exulting triumph at the full establishment of the kingdom of grace—"He shall not fail, nor be discouraged, till he have set judgment in the earth; and the isles shall wait for his law."

Dr. Bryce brought out all these varied expressions in a manner which could not but be felt, yet cannot be described; and the leader of the psalmody rose, struck his little pitch fork on the board before him, and began the lines, two of which had been repeated by the Doctor. The words "Behold my servant," were nearly confined to the leader and the choristers; but "see him rise, exalted in my might," brought in the full swing of the congregation, whose music, rendered in the genuine fervour of the heart, appeared to have caught the spirit of the Doctor's reading. It softened away at the lines beginning "Gentle and still;" became firm and confident at "Judgment he shall bring forth;" and during the four

concluding lines, "the beam out of the timber," was literally quivering to the rolling flood of sacred melody.

There may be a great deal in habit; but at the time of hearing a psalm or hymn sung by a whole congregation, in the fervour of their voices and without accompaniment, as this was sung in the church of Glengowan, it is not very easy to imagine a better preparation for the willing and effective hearing of Divine truth.

Dr. Bryce rose again: "Let us pray." The congregation stood up: he spread forth his hands towards heaven; and after an acknowledgment of the majesty, power, wisdom, and goodness of "the Hearer of prayer," and an ascription of praise for past mercies, general and particular, he took in succession the three parts of public prayer—confession, supplication, and thanksgiving. The prayer was fervent; and from the volume of information which it embodied, and the style in which it was expressed, most likely it was a studied prayer, and one upon which much labour had been bestowed; but it harmonized so well, not only with the devotional feeling in the church, but with the season and the state of nature around, that it had all the effect of a spontaneous production of the time. At the close of it he took the Bible, and read the first twelve verses of the forty-second chapter of the book of Isaiah. They were well read, and followed on the book by the congregation every one; but there was not a word of commentary.

"Let us again sing to the praise of God:" and he read these eight lines of the same hymn as before:—

" I will establish with the lands
A covenant in thee,
To give the Gentile nations light,
And set the prisoners free.

" Asunder burst the gates of brass,
The iron fetters fall;
And glorious light and liberty
Are straight restored to all."

The singing was as fervent as before, and the strain of exultation during the last four lines was given with perhaps more power, but it had not to a stranger the force of a first impression.

Again, "Let us pray;" and a short prayer was offered up for Divine counsel and strength in declaring the truths of the Gospel, and in hearing the declaration. When this was finished, he read his text: Isaiah xlii. 1, "Behold my servant, whom I uphold; mine elect, in whom my soul delighteth; I have put my spirit upon him: he shall bring forth judgment to the Gentiles." Having read these words twice, Dr. Bryce closed the Bible, and again repeated them in a very slow and solemn manner, laying the emphasis in such a way that the text showed the principal points that were to be in the sermon.

The closing of the book shows that you are to

have a sermon of the olden time, of those days when every minister of the Church of Scotland devoted his whole heart and soul to the study and practice of his sacred calling. The analysis, or even the printing at length of a good sermon, is always an injury to it; because the expression and the voice, which send it home to the heart of the hearer, cannot be written or printed.

Dr. Bryce's sermon was eloquent certainly, but the eloquence was in the matter, not in the words. These were simple; and it contained not a single trope or flourish for the purpose of showing the orator. The object was instruction to the whole people, and so it became necessary that they all should understand.

The Saviour was not held up to the view of the world only as God, but as God-man, in the character of Mediator. His mission being to men in their compound nature, and to reach the soul through the organs of the body, the Son of God took human nature upon him: "The Word was made flesh." It is this body, this human nature of Christ's, which is the "servant," the "elect," that men of all ages and nations are called to behold, and not only the Divine nature, as co-equal and co-eternal with the Father and the Holy Ghost; for that, being Spirit, can only be spiritually discerned. The preacher showed, that the whole tenour of the evangelical history—the history of Jesus of Nazareth, from his birth at Bethlehem to his ascending into heaven from Bethany, as simply but faithfully recorded by his inspired disciples, goes to establish the truth of this.

But if he took human nature upon him so that he could sympathize with the frailties of humanity, and address instruction to mankind in the body, the only state in which instruction can avail them, still he was God as well as man. The nature, which he had "elected" as the instrument of his mission, was the "servant;" but the governing spirit which that servant obeyed, was the Most High God. "I have put my Spirit upon him." It is not said *in* him, as implying a finite spirit, but *upon* him, as may be said of an infinite and eternal Spirit, present through all space, in all duration.

The necessity of such a Mediator, for delivering the human race from the vengeance of that holy law which they had broken, and the goodness of God, in having of his own free grace provided such a Mediator, were points which Dr. Bryce enforced with great clearness and effect. He showed according to the judgment of human reason, that as man had fallen under the Divine law as innocent, he was under it as guilty; and that as, even in innocence, he could not have done more than keep the law, and in fact did not keep it, much less could he, after he was guilty, regain his innocence of his own strength, or even prevent himself from adding transgression to transgression. Then he showed

that the whole history of the Old Testament is a practical confirmation of the great and important truth, that there can be no salvation for man except through the atonement by the Saviour. The proof afforded by the Jewish history is complete: they had every privilege given them; they had a law and a ritual of God's appointment; they had every form of government; and God fought their battles for them. They had, in a word, all that they could have as mere men; but that did not make them better than the nations around them. It is in this example which it furnishes, that "the law is a schoolmaster to bring us to Christ;" and because, without Him, the law only convinces men of their guilt, without affording the least hope of pardon, "Christ is the end of the law for righteousness to them that believe."

The next point was the promise and its fulfilment: "He shall bring forth judgment to the Gentiles." Not indiscriminate "mercy" to those who neglect or despise the appointed means of grace, but "judgment,"—the rewarding of every one according as the means and the opportunities are improved; the evidence of this improvement in the sight of man, who cannot see and judge the heart, being "a life and conversation becoming the Gospel." Dr. Bryce showed that this promise is equally given to all men; and then he drew a most cheering picture of the spread of the Gospel among all nations.

Then followed the application to those whom he was addressing; but as this was between pastor and flock, and adapted to the peculiar state of the latter, it cannot be very easily adapted to general readers. The whole sermon was listened to with great attention, and this last portion of it with much apparent delight, as if every one present had personally felt "a word in season" in it.

Next came the last prayer of the morning service, consisting chiefly of supplication and benediction blended together. This is the proper method. When a man takes upon himself to bless, even in the name of God, there is something arrogant in it; but nothing is more becoming than to hear a minister of the Gospel imploring the blessing of God. That by Dr. Bryce began with the service of the morning, then his flock and himself, after that the whole church of God, the nation and its rulers, all nations—all mankind, as one great family, the workmanship of one God. After prayers sixteen lines of the metrical version of the ninety-eighth psalm, beginning thus,

"O sing a new song to the Lord,
For wonders he hath done,"

were read and sung, in the same manner as before; and then a short benediction, alluding, however, to meeting again in the afternoon, closed the morning service.

The interval lasted only half an hour, during which some talked together in the churchyard,

discussing the points of the sermon ; some sauntered along the fields, or down the brook ; and a very few from the more distant parts refreshed themselves with rolls and small beer ; but the leading topic with all was the service and sermon.

The afternoon service was shorter, as there was only one psalm and prayer at the beginning, and no reading. The opening prayer was also shorter, and the sermon one of duties more than of doctrine. The concluding prayer was longer, however, and went more into detail ; and the blessing which concluded the service was more comprehensive and earnest than that of the morning. There is a sort of adaptation in those prayers and implorings of benedictions to the varied lengths of time to which they are understood to apply. The first prayers, both of the morning and the afternoon, are, to a certain extent, retrospective, the morning one reaching back to the preceding Sabbath, and the afternoon one only to the time that has elapsed in the interval. The closing prayers are more of a prospective character, the morning one having reference to the interval only, and the evening one to the whole time until Sunday shall again come round. It is not to be understood, however, that these distinctions are systematically observed, for they are partially departed from in all cases, and wholly neglected in not a few, though in every case there is a difference in the strain of the prayers

for the different parts of the service, and a similarity in those that apply to the same time of it.

The dismissal of the congregation in the afternoon is the time for hearty greetings with those friends who, living in different parts of the parish, do not see each other often, except on the Sabbath ; and when the minister is a favourite, a farewell takes place between him and his flock generally, though a few often go to dinner with him, and afterwards consult as to how the welfare of the parish, religious, moral, and otherwise, may be best promoted. The others seek their way to their homes ; and it is no very unusual thing to see a few of the numerous families exchange two or three of their younger members for the evening. This keeps up friendship, affords variety to all, and crowds nobody. The dinner is plain but comfortable, and all are satisfied. When dinner is over the young ones repeat their notes of the sermon, and then take their books, very generally to the pleasant spots of the fields. The labourers follow nearly the same practice, and may be seen in the shelter of the hedges and copses, some reading alone, and sometimes one reading to another. The evening wears away in this quiet manner ; and just as it closes in the voice of family devotion is again heard, after which all retire for the night, refreshed in their bodies and instructed in their minds, by the repose and the devotion of a genuine Sabbath.

THE MURDERER'S CONSCIENCE.

" I HAVE had no peace nor rest these two years ; ever since that night I have been a miserable fellow as ever lived," said he ; " that Wilson has appeared before my eyes many times." The parson told him that was his evil conscience ; but Bob told him again, he did not know what he was talking about, because he had not seen it. Says Lowe, " If you had seen it, as I have, as plain as I see you at this blessed moment, you would not say it was my conscience, any more than you yourself are my conscience.

" On dark rainy nights particularly," said he, " it used to come up when I was watching the kiln, (he was a brickmaker,) and stand before me as if it was alive ; and if I had not known that it was Wilson, I should have thought it was somebody belonging to the place. It used to come and look at me a little time, and then seem as if it wanted to warm its hands by the fire, and dry itself. But it never could ; for it stayed all night before the kiln, and seemed to be always dropping wet, like as if it had been just got out of the Trent. Sometimes I thought it moaned, and said the same as Wilson said about Liza Hammond when we flung him over ; and that hurt me more and more ; so that I used to shut my eyes, and put my fingers in my ears, and get somebody to sit down close to me in the blaze

of the kiln, to see if we could not frighten it away. But what use was that ? It was under my eyelids directly ; and I did not know whether they were shut or open, till I felt them with my fingers. And then it seemed to come closer and closer, and I could see water run out of its eyes, and it would say, ' Why hadn't you some pity ? ' And sometimes, when the wind blew hard, and drifted round the kiln in a stream, it was blown all about like smoke ; but it came back again, and settled over against me, and shivered, and wrung the wet off its hands, as if it were starved to death.

" At last," said he, " I got tired of seeing it, and felt as if it would crumble my heart to dust. I took no pleasure in drinking ale, as I used to do ; and I said to Jack Swanwick, one time when we had been talking about it together, said I, Jack, I am tired of my life, such as it is, will you throw me over ? For, do you know, I must not do it myself ; because, when I thought of such a thing sometimes, as I did often stand on the kiln wall, and think I would throw myself into the fire, because I was only fit for hell,—it would come up directly, as bright as silver, and cry like a child before me.

" So I put my hands before my face, and went down to the clay-pools to wash my forehead cold.

I never could think of killing myself but there it was, as if it wanted me to live till God should call me. So I turned to my work like a man, and took to going to church on a Sunday, as I never had done in my life before. But I used to see it for all that, till I asked Jack Swanwick to fling me over the wall in the same place as we had flung Wilson. * * * It was in the autumn time that was; and when we were getting towards the brig-foot, says I, Jack, will you do for me now?—"I'll fling you over as soon as look at you, if you like," says he, and laid hold of my arm. But when we were getting against the same place, he stopped all at once, and says he, 'Bob, what is that on the wall?' Good God! I knew what it was in a moment, and I turned like ice when he said he saw it as well as me. 'It's that Esau,' said he in his drunken courage, 'and I'll go and knock him off.' I caught hold of his arm, and held him fast, but I could not speak. Jack was resolute, and pulled hard to go; but when he saw he could not get away, he doubled his fist, and held it up where the thing was, and says he, 'You—

you, what have you come out of the Trent for? And then he made a sudden start to get at it; but something came across his mind at that moment, and he fell down on his knees, and prayed to the Lord like a preacher.

"When he got up again, his face dropped sweat; and, says he, 'Bob, let us go away from here, for there is a dead man about, come out of his dust again. He licked my eyes with a tongue like iron, and I can see the stones of that wall, and Wilson's blood on them, as plain as sunshine, and yet it is as dark as pitch.'

"So we tried to cross the brig, but it came again, and set a row of fire across from one wall to the other, and stood in the middle itself, with its arms and head hanging down, as if it were dead. We turned back and got into the Horse-shoes again, (the public-house which they had just left,) and there we stopped till they turned us out at twelve. But we durst not go over the brig again; so we went and stayed under a hedge all that cold night, but we never shut our eyes."
—*Bilberry Thurland.*

MEHEMED ALI, VICEROY OF EGYPT.

(*From l'Egypte et la Turquie, de 1829 à 1836.*)

A SENTINEL was placed at the door of one of the rooms which occupied the four corners of the great hall; Méhémed Ali was there. When we entered he was striding across the room, and talking with his minister, Boghos-Bey, who was standing before him in the most respectful attitude. He immediately made us a sign to be seated, and he placed himself on the angle of his divan. Three enormous candles of wax, in silver candlesticks, nearly three feet high, spread a dull light over the room, whose white-washed walls were ornamented only by a few rude paintings, and two frames, containing the drawings of the first two ships built in Egypt. The rest of the furniture consisted of a divan of scarlet, with a great round table, surmounted by a chandelier. Méhémed Ali is an old man, of short stature; his quick and piercing eyes, and the white beard which covers his breast, redeem, in some measure, the expression—which is rather common—of his physiognomy, habitually gay and open. By a remarkable singularity, the pacha, whilst imposing upon his troops the new costume adopted throughout the empire, has scarcely made any modification in his own. In the evening he wears generally the long dress of the mamlouks, and his head is always covered by the folds of a large white turban, arranged in the Albanian fashion. Endowed with much natural intelligence, joining the most prepossessing manners to a great enthusiasm for the European innovations, the pacha possesses, in the highest

degree, the art of captivating his hearers, and of imposing his manner of seeing things on those who are about him. We need not be surprised, therefore, at the reputation which has been given to him in Europe by the persons who have had an opportunity of approaching him. We were impatient to begin a conversation in which we expected that the regenerator of Egypt was going to reveal himself to us; but it turned almost entirely on questions of commerce; and we could not help feeling a kind of disappointment in finding only the speculator and merchant where we thought we should have found the conqueror and legislator. * * *

Alexander the Great is the favourite hero of the viceroy. Having learned that there existed a summary of the histories of this conqueror, he ordered the work to be procured from France. We were present when it was brought to him: arabesques in gold added to the elegance of this handsome volume, on which Thouvenin seemed to have exhausted the resources of his art. "In how short a time can you give me this book translated?" was the question put to one of his interpreters. "In six months." "It is too long," answered the pacha with vivacity; and seizing immediately the yataghan of one of his khawass, he quickly parted the rich volume into three. "In this manner three of you can work upon it; I must have the translation in two months. And I, also," said Méhémed Ali to us, "I intend that the events of my life shall be related to men.

Every day I dictate to my *kiatib* (secretary) a portion of my history; and it is wonderful how one fact brings up another, and how a crowd of circumstances which I had forgotten are brought back to my memory. Admire," added he, after a moment's silence, "how He who knows all things is impenetrable in his designs. They tell me that Alexander and Ptolemy were Macedonians; and I, too, am of Macedonia. Our country, then, was destined thrice to give masters to Egypt; but my power extends much further than theirs in this country; and I hope, with the assistance of Heaven, to discover one day if, as your Champollion believes, the Pharaohs reached the sources of this Nile blessed by God." Our con-

versation lasted more than an hour. The physiognomy of the pacha was animated; and we experienced an inexpressible charm in hearing this extraordinary man abandoning himself to his natural talkativeness and curiosity, and mixing, more than once, traits of ingenuous ignorance with the observations of a subtle and penetrating mind. After we had been served with coffee, in *zarfs* ornamented with diamonds, the viceroy arose, and we took our leave of him, announcing to him, at the same time, our departure for Nubia. "Go," said he, "visit without fear every part of my dominions; every where you will find aid and protection."

THE SNOWDROP.

Ere a leaf is on the bush,
In the time before the thrush
Has a thought about her nest,
Thou wilt come with half a call,
Spreading out thy glossy breast
Like a careless prodigal;
Telling tales about the sun,
When we've little warmth or none.

Prophet of delight and mirth,
Ill requited upon earth;
Herald of a mighty band,
Of a joyous train ensuing,
Serving at my heart's command,
Tasks that are no tasks renewing,
I will sing, as doth behove,
Hymns in praise of what I love.

WORDSWORTH.

Thou beautiful flower of the forest-woods!
Alone 'midst the cold snow's solitudes,
Like a spirit come down 'midst the leaves to dwell,
In the beautiful bloom of thy silver cell.

I could worship the starlight that dwells in thine eye,
As e'en I could worship the stars of the sky,
And the mantle of peacefulness spread over thee,
Like a garment of shadowless purity.

Thou dwellest alone in the forest-cave,
Where the moss spreads around like an emerald wave,
Where the insects of winter do sleep and dwell,
Till they wake at the chime of thy silver bell.

Thine own white leaf is thy couch of rest,
And the viewless woof of the gossamer's vest
O'ershadows thy sleep from the cold moonlight,
And the arrowy wind of the keen midnight.

Thine anthem at eve is the redbreast's hymn,
When she droopeth her wings in the twilight dim,
And murmurs her song at the death of the day,
When the clouds and the sunshine are dying away.

Thou hearest the songs of the angels of light,
As they waft through the heavens the stars of the night,
And bear the white moon through the shadowy sky,
Till her "sweet light" is quenched in eternity.

And the spirit-like song of the lark, when she sings
To the heavens of morn, on her shining wings,
Awakens thee up from the cave of thy bower,
In the light of thy loveliness, beautiful flower!

But O! whence hast thou wandered to slumber here,
'Neath the cold dead boughs, so wan and serene,
With no canopy woven to shelter thy dream
From the tempest's rush and the north-wind's scream?

The clouds and the shadows will pass over thee,
As they sail o'er the mountainous woods to the sea;

And will blight with their sadness thy loveliest bloom,
And the hail-storm will scatter thy leaves to the tomb.

Alas! thou wilt mourn when the cold wind's moan
Shall pass like a storm through the woods alone;
And the boughs of the forest shall shake with dread,
And the dead leaves shall rustle around thy bed.

And the thunder shall come with a terrible sound,
And the lightnings shall wander the woods around;
And the tiger shall rise with affrighted ken,
And howl from the depths of his lonely den.

And, oh! if the lightning should gleam over thee,
And crush thy pale bloom in its purity,
And shed o'er thy beauty the blight of death,
And the pale snow should weave thee a funeral wreath

The Naiads, that dwell in the flowery vale,
Whose eyes are as lovely as moonlight is pale,
Would weep o'er thy death-bed that thou too wert
gone
To dwell like a star in the blue horizon.

And the spirits that fold up their lovely wings,
By the mossy haunts of the fountain-springs,
Would bring to thy bower, in the lonely dell,
A shroud of the funeral asphodel.

And the wind would bear up thy burial train,
And murmur around thee a requiem-strain;
And waft thy soul from the lonely woods
To an isle 'midst the ocean-solitudes.

There wouldst thou dwell by the sound of the sea,
A sound like an anthem choristry;
And the swell of the billow—the foam of the wave,
Would wander like sadness around thy grave.

But these may not be—such visions of death
Shall never blight over thy silvery wreath.
And the hail-storm's blast and the deep wind's moan
Shall crush every flower but thine alone.

The dawn of the day-light shall shine upon thee
Like a spirit of love in its purity;
And the sunshine of heaven shall open thy bell,
And see its bright beauty shine down in thy cell.

The moonlight's pale fingers shall close up thy leaves,
And the silvery clouds 'round thy bower shall weave
A beautiful vision of flower and star,
Sent down to thy couch from the heavens afar.

Therefore we may not weep over thy bloom,
Though thy light be as pale as the lamp of a tomb;
For thou in thy purity surely wert given
But to tell of the spring-time of flowers in heaven!

EPRON.

INFANT EDUCATION.

(From Mudie's "Spring," now in the press.)

WHEN the infant is taken into the garden, gay with flowers on stem and shrub, its little hands are eagerly "on the stretch," its eyes are widely opened and sparkling with delight, its face is all radiant with smiles, it "coos" and murmurs a language in the ear of nature which none but nature can interpret; every muscle of its frame quivers, every articulation moves, and it probably learns more, acquires more of the knowledge and use of the members of its own body—the first and most valuable of all education—in one half hour among the flowers, than in a whole month in the nursery.

The nursery! Education is but too often spoiled there, and the body is enfeebled, much in the same manner as the mind is subsequently narrowed, warped, and perverted in the schools. Among the wealthy, especially, the body is often cruelly bereaved of its infant education; and this because the fond but foolish parents "can afford to have their children taken proper care of." The cares of vanity are the curses of man. "Which of you, by taking thought, can add one cubit to his stature?" But we may prevent a cubit of the growth, or, which is worse, spoil the quality and usefulness of what does grow. In every rich and luxurious state of society thousands are deprived of the proper use of their bodies, virtually maimed and crippled by this ill-directed though well-meant care. If such can continue to afford servants instead of hands, and carriages instead of legs, they may linger out their helpless lives, not only without actual suffering, but in the enjoyment of all that can be bought with money. Still they are inferior creatures; for where is the price that can buy a manly hand, a well-nerved arm, a fleet foot on the lea, or a frame thewed, and sinewed, and tempered to all the winds of the heaven, and all the toils of the earth?

Yet these are the temporal heritage specially provided of God for every member of the human race, though the possession is, as we have said, but too often barred by the ill-informed, and therefore injurious, labour of endeavouring to do by art that which can be done by nature only,—to accomplish by the hands of hirelings from without, that which can be done only by the living principle within. Adult imbeciles may remain idle as to all ordinary labours, if they can hire others to perform those labours for them; but the wealth of the world could not hire a set of servants who should grow the bones and muscles of a child, and so leave it perfectly free and at leisure to act the infant gentleman or lady. Yet this is the result to which "the nonsense of the rich man's nursery" constantly tends; and we know no better corrective of it than the flowers and the freshness of nature, which will stimulate the little creature to the use, and therefore to

the growth and tone, of the working structures of its body, in spite of all the efforts that art may make to the contrary.

The constitutional heritage which is thus injured by art and restored by nature, is the only one which is absolutely secure from the contingencies of society. It is not exempted from disease, for disease, like death, will happen to all human beings; and though both, of course, have natural causes in every case, yet these causes are very often equally inscrutable. But the well-developed and properly-tempered human body may be said to be excepted from the grief and suffering, the mental anguish, of disease. The feeble in body are always ailing, very generally they cannot tell what ails them; and thus, what with being sick of the disease, and sick of the doctor, they pass their time in the most piteous misery.

But the frame which has been allowed to work, and sinew, and season itself, dashes all the minor ailments aside; and if strong disease assails it, it stands up to the contest like a giant. That contest is, of course, always severe, and it is often fatal, even in the prime of life; but it has none of that mental anguish, of that half-real, half-imaginary diseases of the feeble, which is truly the heavy and afflictive part of them. As in the compound nature of man the body only can be diseased, so the properly-reared and developed body always takes the burden of the disease upon itself. If this burden is heavy, pressing down to the gates of death, or nearly so, then the body severs the mental connexion, and grapples alone with the grim king, unconscious that any thing is the matter; and there have been many instances of such vigour in the final struggle, as that a dozen men have been required to keep one strong man on his death-bed.

To the sorrowing friends, when hope and stay, haply, is thus stricken down in the prime and middle of its days,—and, if we may use the expression, bearding death, in order that it may maintain and protect them still,—this display is no doubt painful in the extreme. But there is not the least question that is a great blessing to the sufferer. Anguish of which we are unconscious, whatever may be its external display, is really no anguish at all; so that the actual suffering of the strong man may be said to end the moment that the band between bodily sensation and mental perception is loosened. It does far more than this, for a means of recovery is involved in it. Those who feel that they are dying, always in part, and often in great part, die of the feeling. From this those who have consciousness severed from sensation are entirely exempted; and the struggle with the disease, and even with death itself, should that be the termination, is wholly

physical; consequently it is more completely under the command of physical remedies, and, among the rest, the grand healing power of nature itself, than if it were mixed up with mental apprehensions and alarms. The blood courses like an impetuous torrent, throbbing and thundering on the walls of its containing vessels, and straining the capillaries, with vastly-increased force. If these shall give way in any part which is not vital, (and it is generally in a part not vital that they do give way,) then the excess of tide is poured in that direction, topical inflammation ensues, and the disease lessens, an abscess forms, the disease is subdued, and the patient is speedily restored to health and strength.

These are distinctions of which any one who is observant may see numerous instances; and no one will refuse to admit that they are distinctions of the utmost importance, and that the securing of a healthy and vigorous constitution is far more valuable, and therefore far more worthy of attention than the securing of any other earthly possession. It is in the very earliest infancy, almost at the very hour of birth, indeed, that this begins to be lost or won; and if the beginning is in the losing direction, change to the winning one becomes more and more difficult every hour.

Some may consider this a digression, and ask what it has to do with "spring flowers." We would answer such by asking them, Are not infants "spring flowers?" the most lovely, interesting, valuable, and worthy of skilful treatment, that can possibly engage the attention of rational beings? Who can, who dares answer that question in the negative?

All fruit is in the flower, and it is the fear of injury to the flower which gives most solicitude to the cultivator, whether he cultivates the fields for corn, or the garden and the orchard for fruit. It is true, that every part of a plant has its natural enemies, or rather, there are some other productions of nature set over it, in order to keep it down to the place which it ought to hold in the duly-balanced system of nature. We understand but little of the balance of that system, and therefore the plants which we cultivate artificially are the most subject to these attacks; and they are always the more subject to them the more artificial that our system of culture is, either as regards the plant or the soil.

But the flowers whose bloom the cultivator thus watches with so much solicitude are only for one year, or for part of a year in very many instances. The blossoms of the nursery are for a generation,—the hope of threescore and ten years to the healthy individual, and about the half of that period for an age of the whole, in a healthy country like Britain. Upon the cold principle of *utilitarianism*, therefore,—that heart-sickening and hope-withering abomination of modern times, which has crept in since cold-blooded selfishness pilfered the name and tried to usurp the chair

of philosophy,—upon the principle of this detestable doctrine, which ranks human beings among chattels, and, like "the mother of abominations upon the earth," numbers "slaves and souls of men" among the articles of mere merchandise,—upon this—the most loathsome, revolting, and demoralizing doctrine to which the abused and insulted name of philosophy was ever degraded—the blossom of the nursery is thirty-five times as valuable, on the average, and seventy times as valuable to the hope of the individual, as the blossom of the field or the orchard; and if it is so according to such a system, what must it be, then, in the estimation of those who possess common sense and human feeling, and are actuated by the spirit of the Gospel,—who feel, as well as firmly believe, that "children are God's heritage!" Let those who have them, and especially those who have had them, answer the question.

By all means let us go to the fields, and see and gather the wild flowers, and try if we can find out their uses in nature and to man. But let us take the infants with us, for assuredly, in spite of all our wise looks and profound researches, they will profit far more in the regions of wild flowers than we. We get health; and if we do not get instruction and enjoyment it is our own fault; but they get vigorous bodies, and learn how to use them. Walk over the common; if the flowers are few and simple, the air is sweet; and though the birds which are to sing and summer in the thickets may not yet be come, the skylark is over head, and your footing on the sod is cleanly and elastic. At the farther end there is a little and very rude cottage, though without any air of neglect and ruin; and hard by there is a woman, hanging out clothes on the furze bushes,—they are few in number, and far from rich in texture; but they are white as the driven snow. Near her on the open sward, which is peculiarly close, smooth, and green, there is a little flaxen-haired girl, with sky-coloured eye and crimson cheeks, busily employed in culling the early daisies. On the sward there is a young baby, tossing about his arms and legs with much delight, and actually wantoning in the use of them in the free air, and under the simple canopy of heaven. His dress is very humble, and, externally, not over clean; but look at his colour, and mark what limbs he has got! They are not swelled out like pillows, with cumbrous fat, soft to the touch, and hardly able to move,—they are firm and knit; and their action is so vigorous, that if you were to take him by the foot and try to hold it still, he would shake your arm to the shoulder; or if you were to give him a finger of each hand, he could grasp them so firmly as that you could raise him from the ground. All this arises from his food being simply that which nature has provided, improved in quality by the mother's activity and exposure to the fresh air, and from his being allowed to take his own

exercise in every limb and member of his body. At his age there can be no mental training, and no perception of distinction of rank or fashion in him; and therefore, whether his future station is

to be that of ploughman or that of peer, he is at this moment under better training than the son of any nobleman at the same age.

THE AGED SOLDIER.

SLOWLY he pursued his way to dispose of the last remnant of his property, which the long sickness of his aged companion, the wife of his bosom, constrained him to part with, to add to her comfort. It would leave him without a farthing, dependent upon the charity of the world for support.

He seemed lost in thought; and though the busy crowds with hasty steps passed and repassed, he heeded them not. His brow wore the gloom of care, and the rigid expression of his features bore ample evidence of the agony within. His thin grey locks, attenuated and scanty dress, and feeble steps, attracted no attention from the happy throngs who, boasting of their liberty and independence, gaily pursued their own career, unheeding the aged soldier whose valour won those blessings. Liberty and independence were the watchwords of his youth; and as the sounds met his ear, a gleam of native fire flashed from his eyes, and his lips essayed to speak, but the remembrance of unrequited suffering choked his utterance. He glanced at his wounds—a shudder ran through his frame, and he groaned aloud at his country's ingratitude. The paroxysm was soon past; it was but the repetition of many such; and the heroic martyr-spirit which prompted him in early life to brave both battle-field and

halter, was called again to rouse his sunken spirits. Just then the antic gambols of a passing troop of school-boys presented to his mind a faithful picture of happy security. "No," exclaimed the grey-haired veteran with exultation, "I have not fought, I do not live in vain; and though now neglected, perhaps despised, posterity will yet do justice to the soldier of the revolution."

* * * * *

Years rolled on, and the long-delayed compensation for toil and suffering was ultimately granted. Again I saw the veteran soldier: he was seated in the porch of a neat little cottage, situated in the midst of a highly-cultivated garden, recounting to his grand-children the deeds of the revolution, and praising with lively ardour the virtues of the great and good Lafayette. Content and happiness burned in his countenance; and as he mentioned the object of his early toil,—the completion of our independence, and the unrivalled prosperity to which our nation had arrived,—tears fast flowed down the channels of his deeply-furrowed cheeks. They were tears of gratitude, that the soldier's services were at last requited, and the evening of his days made happy by the justice of his government.—*American Periodical*.

COALS.

(From *Buckland's Bridgewater Treatise*.)

As there is no reproduction of coal in this country, since no natural causes are now in operation to form other beds of it, whilst, owing to the regular increase of our population, and the new purposes to which the steam engine is continually applied, its consumption is advancing at a rapidly accelerating rate, it is of most portentous interest to a nation that has so large a portion of its inhabitants dependent for existence on machinery, kept in action only by the use of coal, to economize this precious fuel. I cannot, therefore, conclude this interesting subject without making some remarks upon a practice which can only be viewed in the light of a national calamity, demanding the attention of the legislature. We have, during many years, witnessed the disgraceful and almost incredible fact, that more than a million chaldrons per annum, being nearly one-third part of the best coals produced by the mines near Newcastle, have been condemned to wanton waste, on a fiery heap perpetually blazing near the mouth of almost every coal-pit in that dis-

trict. This destruction originated mainly in certain legislative enactments, providing that coal, in London, should be sold, and the duty upon it be rated, by measure, and not by weight. The smaller the coal is broken the greater the space it fills; it became, therefore, the interest of every dealer in coal to buy it of as large a size and to sell it of as small a size as he was able. This compelled the proprietors of the coal-mines to send the large coal only to market, and to consign the small coal to destruction. In the year 1830 the attention of parliament was called to these evils, and, pursuant to the report of a committee, the duty on coal was repealed, and coal directed to be sold by weight instead of measure. The effect of this change has been, that a considerable quantity of coal is now shipped for the London market in the state in which it comes from the pit;—that after landing the cargo the small coal is separated by screening from the rest, and answers as fuel for various ordinary purposes, as well as much of the coal which was sold in

London before the alteration of the law. The destruction of coals on the fiery heaps near Newcastle, although diminished, still goes on, however, to a frightful extent, that ought not to be permitted, since the inevitable consequence of this practice, if allowed to continue, must be, in no long space of time, to consume all the beds nearest to the surface and readiest of access to the coast, and thus enhance the price of coal in those parts of England which depend upon the coalfield of Newcastle for their supply; and, finally, to exhaust this coalfield at a period nearer by at least one-third than that to which it would last if wisely economized. (See "Report of the Select Committee of the House of Commons on the State of the Coal-Trade, 1830," page 242, and Bakewell's "Introduction to Geology, 1833," pp. 183, 543.)

We are all fully aware of the impolicy of needless legislative interference; but a broad line has been drawn by nature between commodities annually or periodically reproduced by the soil on its surface, and that subterranean treasure and sustaining foundation of industry which is laid by nature in strata of mineral coal, whose amount is limited, and which, when once exhausted, is gone for ever. As the law most justly interferes to prevent the wanton destruction of life and property, it should seem, also, to be its duty to prevent all needless waste of mineral fuel, since the exhaustion of this fuel would irrecoverably paralyze the industry of millions. The tenant of the soil may neglect or cultivate his lands, and dispose of his produce, as caprice or interest may dictate; the surface of his fields is not consumed, but remains susceptible of tillage by his successor. Had he the physical power to annihilate the land, and thereby inflict an irremediable injury upon posterity, the legislature would justly interfere

to prevent such destruction of the future resources of the nation. This highly-favoured country has been enriched with mineral treasures in her strata of coal, incomparably more precious than mines of silver or of gold. From these sustaining sources of industry and wealth let us help ourselves abundantly, and liberally enjoy these precious gifts of the Creator; but let us not abuse them, nor, by wilful neglect and wanton waste, destroy the foundation of the industry of future generations. Might not an easy remedy for this evil be found in a legislative enactment, that all coals from the ports of Northumberland and Durham should be shipped in the state in which they come from the pit? and forbidding, by high penalties, the screening of any sea-borne coals before they leave the port at which they are embarked? A law of this kind would at once terminate that ruinous competition among the coal owners which has urged them to vie with each other in the wasteful destruction of small coal, in order to increase the profits of the coal-merchants, and gratify the preference for large coals on the part of rich consumers; and would also afford the public a supply of coals of every price and quality, which the use of the screen would enable him to accommodate to the demands of the various classes of the community. A further consideration of national policy should prompt us to consider how far the duty of supporting our commercial interests, and of husbanding the resources of posterity, should permit us to allow any extensive exportation of coal from a densely-peopled manufacturing country like our own, a large proportion of whose present wealth is founded on machinery, which can be kept in action only by the produce of our native coal-mines, and whose posterity can never survive the period of their exhaustion.

THE SONG OF NIGHT.

The sun has sunk to his nightly rest,
With the cloudlets of beauty around his breast;
Where the crested waters in glory rolled,
And the skies were mantled in crimson and gold;
Bright as the shores of that happy land
Where the ranks of the blessed in beauty stand.

I am called from the cloud-wreathed mountain's brow
By the voice of the breeze that is murmuring low;
The eagle on high to his eyrie floats,
And the night-birds are waking their silvery notes;
And the vesper star, with her chastened beam,
Shines calmly and bright in each rolling stream:

She has watched the sun to his nightly home,
And she calls me forth, for my reign is come.
I gird on my zone with its emeralds bright,
And my coronal sparkles with lustrous light;
They have set my throne in the darkened sky,
And the watchers are out in their towers on high.

I come, I come, with my fairy song,
O'er the homes of the sleeping to wander along;
While the zephyr her balmy fragrance flings
To the dew-crowned rose from her musky wings;
And the voice of the stars is arising on high,
As they roll in their glory along the sky.

And silence has come from her secret cell
To enchain the world with her mystic spell:
The hum of the murmuring bees that roam
Awakes not the nymphs in their sylvan home;
And the flowers are shedding a pearly tear
For joy that my nightly song they hear.

Earth sleeps with her bright and sparkling streams,
And her children are gone to their pleasant dreams;
Let the music of gladness arise on high
From the spirits that sweep o'er the darkened sky:
For I come, I come, with my starry train,
Through the depths of the heavens to wander again.

T. A.

EVANGELICAL PREACHING.

THE number of the "Edinburgh Review" just published, contains one of the most violent and indefensible attacks on evangelical preaching which it was ever our calamity to witness. Charges the most unfounded, and caricatures the most exaggerated, are to be found in every page; and all because those who are denominated "Evangelical Preachers" insist on "man's natural depravity, and inability to do any thing for himself;—the new birth by the Spirit;—and salvation by faith alone;" and will not content themselves with being, what Horsley very properly termed, "the apes of Epictetus." That the mode of exhibiting evangelical truth might, in many instances, be improved, and that a defective education, mental inferiority, or contracted views of the great Gospel system, often impair the natural effects of that system, are facts which none can deplore more deeply than the great majority of the evangelical preachers themselves; though in making the acknowledgment they are, in truth, doing little more than confessing to the imperfection of all human instrumentality. But the reviewer aims higher than this,—he would not only change the mode, but revolutionize the character of evangelical preaching, robbing it utterly of that energy to which, under God, it owes its success. His accusations look so much like a new out-break of the old enmity to the Gospel, that we are constantly reminded, as we proceed, of the names of those who, in different ages, have disastrously shone as "accusers of the brethren."

But we beg to put him into the hands of a master: the following defence of evangelical preaching, from the pen of the late Robert Hall, is not merely appropriate, it contains information on the subject in question sufficient to enlighten the most ignorant, and argument to silence the most unevangelical:—

"The term 'evangelical' was first given the class, simply on account of their preaching the Gospel; or, in other words, their exhibiting with clearness and precision the peculiar truths of Christianity. In every system there are some principles which serve to identify it, and in which its distinguishing essence consists. In the system of Christianity, the rules of moral duty are not entitled to be considered in this light, partly because they are not peculiar to it, and partly because they are retained by professed infidels, who avow without scruple their admiration of the morality of the Gospel. We must look, then, elsewhere, for the distinguishing character of Christianity. It must be sought for in its doctrines,—and (as its professed design is to conduct men to eternal happiness) in those doctrines which relate to the way of salvation, or the method of a sinner's reconciliation with God. There are some, we are aware, who would reduce the whole faith of a Christian to a belief of the Messiahship of Christ, without reflecting that, until we have fixed some specific ideas to the term Messiah, the proposition which affirms him to be such contains no information.

"The measure of zeal they display for them, they conceive to be justified, as well by a view of the actual state of human nature, as by the express declaration of the inspired oracles. Conceiving, with the compilers of the articles, that the state of man is that of a fallen and apostate creature, they justly conclude that a mere code of morals is inadequate to his relief; that having lost the favour of God by his transgression, he requires, not merely to be instructed in the rules of duty, but in the method of regaining the happiness he has forfeited; that the pardon of sin, or some compensation to Divine justice for the injury he has done to the majesty of the supreme Lawgiver, are the objects which ought, in the first place, to occupy his attention. An acquaintance with the rules of duty may be sufficient to teach an innocent creature how to secure the felicity he possesses; but can afford no relief to a guilty conscience, nor instruct the sinner how to recover the happiness he has lost. Let it be remembered, that Christianity is essentially a restorative dispensation; it bears a continual respect to a state from which man is fallen, and is a provision for repairing that ruin which the introduction of moral evil has brought upon him. Exposed to the displeasure of God and the curse of his law, he stands in need of a Redeemer; disordered in his powers, and criminally averse to his duty, he equally needs a Sanctifier. As adapted to such a situation, much of the New Testament is employed in displaying the character and unfolding the offices of both, with a view of engaging him to embrace that scheme of mercy, which the Divine benignity has thought fit to exhibit in the Gospel. The intention of St. John, in composing the evangelical history, coincides with the entire purpose and scope of revelation. 'These things are written,' said he, 'that ye may believe that

Jesus is the Christ, and that, believing, ye might have life through his name.' Whoever considers that, upon every hypothesis except the Socinian, Christianity is a provision of mercy for an apostate and sinful world, through a Divine Mediator, will acknowledge that something more is included in the idea of preaching the Gospel, than the inculcation of moral duties; and that he who confines his attention to these, exchanges the character of a Christian pastor for that of a fashionable declaimer or a philosophical moralist. If we turn our eyes to the ministry of the apostles, we perceive it to have consisted in 'testifying repentance toward God and faith in our Lord Jesus Christ;' repentance, which is natural religion modified by the circumstances of a fallen creature, including a return to the path of duty; and faith, which is a practical compliance with the Christian dispensation, by receiving the Saviour as the way, the truth, and the life. Faith and repentance being the primary duties enjoined under the Gospel, and the production of these the professed end of the inspired writers, we need not wonder that those who are ambitious to tread in their steps, insist much, in the course of their ministry, on the topics which supply the principal motives to these duties;—the evil of sin, the extent of human corruption, together with the dignity, power, and grace of the Redeemer. Remembering that the object of repentance is God, they do not, in treating of sin, satisfy themselves with displaying its mischievous effects in society: they expatiate on its contrariety to the Divine nature; they speak of it chiefly as an affront offered to the authority of the Supreme Ruler; and represent no repentance as genuine, which springs not from godly sorrow, or a concern for having displeased God. In this part of their office, they make use of the moral law, which requires the devotion of the whole heart and unflinching obedience, as the sword of the Spirit, to pierce the conscience, and to convince men 'that by the deeds of it no flesh living can be justified, but that every mouth must be stopped, and the whole world become guilty before God.' The uniform course of experience serves to convince them, that, till a deep impression of this truth be made on the heart, the character of the Saviour, and the promise of pardon through his blood, will produce no gratitude, and excite no interest. In inculcating faith in Christ, they cannot satisfy themselves with merely exhibiting the evidences of Christianity; a mere assent to which upon historical grounds, undeniably falls, in innumerable instances, of producing those effects which are uniformly ascribed to that principle in the New Testament,—neither overcoming the world, nor purifying the heart, nor inducing newness of life. They are of opinion, that the external evidences of the Christian religion are chiefly of importance, on account of their tendency to fix the attention on Christ, the principal object exhibited in that dispensation; and the faith on which the Scriptures lay so much stress, and connect with such ineffable benefits, they conceive essentially to involve a personal reliance on Christ for salvation, accompanied with a cordial submission to his authority. Attempting to produce this scriptural faith, in a dependence upon the Divine blessing, (without which the best means will be unsuccessful,) they dwell much on the dignity of his character as the Son of God, the admirable constitution of his person as 'Immanuel, God with us,' the efficacy of his atonement, and the gracious tenour of his invitations, together with the agency of that Spirit which is intrusted to him as the Mediator, to be imparted to the members of his mystical body. In their view, to preach the Gospel is to preach Christ; they perceive the New Testament to be full of him; and while they imbibe that spirit with which it is replete, they feel a sacred ambition to diffuse 'the savour of his name in every place.'

"Let it not be inferred from hence that they are inattentive to the interests of practical religion, or that their ministry is merely occupied in explaining and enforcing a doctrinal system. None lay more stress on the duties of a holy life, or urge with more constancy the necessity of their hearers showing their faith by their works; and they are incessantly affirming, with St. James, that the former without the latter is dead, being alone. Though, in common with the inspired writers, they ascribe their transition from a state of death to a state of justification solely to faith in Christ previous to good works actually performed, yet they equally insist upon a performance of those works as the evidence of justifying faith, and, supposing life to be spared, as the indispensable condition of final happiness. The law, not altered in its requirements, (for what was once duty they conceive to be duty still,) but attempted in its sanctions to the circumstances of a fallen creature, they exhibit as the perpetual standard of rectitude, as the sceptre of majesty by which the Saviour rules his disciples. They conceive it to demand the same things, though not with the same rigour, under the Gospel dispensation as before. The matter of duty they look upon as unalterable, and the only difference to be this,—that whereas under the covenant of works the condition of life was sinless obedience, under the new covenant an obedience sincere and affectionate, though imperfect, is accepted, for the sake of the Redeemer. At the same time, they do not cease to maintain that the faith which they hold to be justifying comprehends in it the seminal principle of every virtue;—that if genuine, it will not fail to be fruitful;—and that a Christian has it in his power to show his faith 'by his works,' and by no other means. Under a full conviction of the fallen state of man, together with his moral incapacity to do what is pleasing to God, they copiously insist on the agency of the Spirit, and affectionately urge their hearers to im-

plore his gracious assistance. From no class of men will you hear more solemn warnings against sin, more earnest calls to repentance, or more full and distinct delineations of the duties resulting from every relation in life, accompanied with a peculiar advantage of drawing, from the mysteries of the Gospel, the strongest motives to strengthen the abhorrence of the one, and endorse the practice of the other. In their hands morality loses nothing but the pagan air with which it is too often invested; the morality which they enjoin is of heavenly origin,—the pure emanation of truth and love, sprinkled with atoning blood, and baptised into an element of Christian sanctity. If we look at the effects produced from the ministry of these men, they are such as might be expected to result from a faithful exhibition of the truth of God. Wherever they labour careless sinners are awakened, profligate transgressors are reclaimed, the mere form of religion is succeeded by the power, and fruits of genuine piety appear in the holy and exemplary lives of their adherents. A visible reformation in society at large, and, in many instances, unequivocal proofs of solid conversion, attest the purity of their doctrines, and the utility of their labours; effects which we challenge their enemies to produce where a different sort of teaching prevails.

"The controversy between them and their opponents, to say the truth, turns on a point of the greatest magnitude,—the question at issue respects the choice of a supreme end, and whether we will take the 'Lord to be our God.' Their opponents are for confining religion to an acknowledgment of the being of a God, and the truth of the Christian revelation, accompanied with some external rites of devotion, while the world is allowed the exclusive dominion of the heart. They are for carrying into effect the apostolic commission, by summoning men to repentance, and engaging them to an entire surrender of themselves to the ser-

vice of God, through a Mediator. In the system of human life, their opponents assign to devotion a very narrow and limited agency; they contend for its having the supreme control. The former expect nothing from religion but the restraint of outward enormities by the fear of future punishment; in the views of the latter it is productive of positive excellence,—a perennial spring of peace, purity, and joy. Instead of regarding it as a matter of occasional reference, they consider it as a principle of constant operation. While their opponents always overlook and frequently deny the specific difference between the church and the world, in their views the Christian is a pilgrim and stranger in the earth, one whose heart is in heaven, and who is supremely engaged in the pursuit of eternal realities. Their fiercest opposers, it is true, give to Jesus Christ the title of the Saviour of the world, but it requires very little attention to perceive that their hope of future happiness is placed on the supposed preponderancy of the virtues over the vices, and the claims which they then conceive to result on the justice of God; while the opposite party consider themselves as mere pensioners on mercy, flee for refuge to the cross, and ascribe their hopes of salvation entirely to the grace of the Redeemer.

"For our parts, supposing the being and perfections of God once ascertained, we can conceive of no point at which we can be invited to stop, short of that serious piety and habitual devotion which the evangelical clergy enforce. To live without religion, to be devoid of habitual devotion, is natural and necessary in him who disbelieves the existence of its object; but upon what principles he can justify his conduct who professes to believe in a Deity, without aiming to please him in all things, without placing his happiness in his favour, we are utterly at a loss to comprehend."—*Hall's Works*, vol. II.

SCENES IN THE EAST.

JERUSALEM.—Jerusalem is peculiarly situated on a species of promontory, nearly encircled by higher eminences.

This terminates on the east in the craggy valley of Jehoshaphat, through which runs the brook Kedron, and is bounded on the south and west by the valley of Hinnom, while to the north it stretches away in an uneven plain, over which the ancient city probably extended. Immediately beyond the ravine rise the other elevations: that of the Mount of Olives, with its three summits, a few clusters of trees, and its highest point crowned with a building, commands a fine prospect of the whole city. Like other Turkish towns, the survey of the interior disappoints the expectations excited by its external appearance. The streets are narrow and uneven. Irregularly placed houses with diminutive doors, and now and then a projecting upper window, are badly built; and, from the scarcity and dearth of timber, are usually covered with rude beehive-shaped roofs. In some directions are detached heaps of ruins, and in others are inclosures fenced with the prickly Indian fig. Towards the Jews' quarter some extensive ranges of walls and arches, the remains of the spacious hospital of the Knights of Malta, are still considered by the Hebrew inhabitants as English property. A few stragglers only are seen wandering in the streets—the bazaars are miserably furnished—one of them, arched and dark, is fast falling to ruin. The trade of the town is confined to chaplets, crosses, carved shells, models of the sacred places, and mother-of-pearl receptacles for holy water, which, sanctified in the sepulchre, are eagerly sought for, and widely distributed through Catholic Europe. So low, however, is the state of art, that one individual only, an ingenious and intelligent Jew, can engrave the seal rings, so generally worn in the east, while a few native Christians carve rudely in mother-of-pearl, or tattoo the arms of pilgrims with sacred symbols. Of bread and meat there is no lack, but of the latter little variety. Fruit and vegetables are sparingly supplied, although on Fridays the neighbouring peasants hold a kind of market—those of the Moslem faith assembling for devotion, as well as to dispose of their scanty produce.—*Dr. Hogg's Visit to Jerusalem*.

PATMOS.—Patmos, the place of St. John's banishment, at present named Palamos, is one of those small islands in the Archipelago, or Egean sea, which went

under the general name of the Cyclades, and is supposed to have been the most rocky, barren, and unproductive among them. Its whole circumference does not exceed eighteen miles; and though it is placed at the distance of forty miles from the Asiatic continent, yet, owing to its mountainous surface, it can be easily seen from the city of Ephesus. It was long used as a state-prison by the Romans. It was, indeed, their principal depot in the Mediterranean for those prisoners who were put for any length of time under severe restraint. In most places the shores are inaccessible, rendering it difficult of access, and equally difficult to escape from. There is not a spot in the Archipelago which has more the appearance of a volcanic origin than Patmos. Different parts have the semblance of craters, and substances resembling lava are common among the fragments of the rocks. La Scala, the only town in the island, appears to be built on the edge of one of the ancient craters, sloping off on either side like the roof of a house. As the valleys are generally left without culture, few places can present a more gloomy and desolate appearance to the traveller.—*Culbertson*.

BABYLON.—Though no antiquary, as I have said, I determined in my mind, that I was passing along the walls of Babylon. Many fragments of bricks were lying among the sand, some marked with the character I noticed in Hillah. All was barren around; although at some distance, where the waters were shallowest, I could see the grass peeping above them. By the walls I had found a dry road to the base of the huge shapeless mound on which the tower is placed; its circumference estimated at little more than seven hundred yards; a narrow way divided it from a still larger and more irregular heap, upon the side of which stood, facing the tower, a small mosque. If the dervishes to whom these memorials are erected, lived on the spots where the tombs now stand that are to be seen over the remains of Babylon, they selected well for the abandonment of the world; more forlorn spots could scarcely be found; for, in the Great Desert, even, there is verdure and flower—here all is utter misery.

On the height of the first mound stands a well-built tower, of something less than forty feet high. Such an erection in modern days would excite admiration for its workmanship; with what astonishment must it be viewed in the supposition that its age exceeds four

thousand years! Huge heaps of brick lie about, melted into solid masses, as if by the action of fire; and the whole mound on which the pillar stands is covered with fragments of well-baked bricks; and this is the Temple of Belus, it is said, or the Tower of Babel. At any rate, be it what it may, it stands on the plain of Shinar, where Babylon once stood; and most completely, as my eyes wandered over the scene of desolation, did I feel the truth of the fulfilment of the judgments pronounced against her; yes, "Every one that goeth by Babylon shall be astonished."—*Skinner's Overland Journey to India.*

The most remarkable ruin, both in magnitude and name, is that called by the Arabs, Birs Nimrod, or Nimrod's tower. This, there is every reason to believe, was the ancient tower of Babel, the earliest and mightiest specimen of human skill and human audacity. The travels of Mr. Rich and Sir R. K. Porter have rendered us more familiar with those huge ruins than could previously have been hoped for. The compressed view of their accounts given by Heeren is very striking and animated.

"This huge mass of building lies about six miles south-west of Hillah. It has the appearance of an oblong hill, the base of which, according to Porter, is two thousand and eighty-two feet in circumference. Rich reckons it two thousand two hundred and eighty-six. It may easily be conceived, that it is scarcely possible to fix in a positive manner the circumference of such a ruin. Its present height, reckoning to the bottom of the tower which crowns its summit, is two hundred feet; the tower itself is thirty-five. Looking at it from the west, the entire mass rises at once from the plain in one stupendous, though irregular pyramidal hill. It is composed of fine bricks, kiln-baked. From the western side, two of its stories may be dis-

tinctly seen; the first is about sixty feet high, cloven in the middle by deep ravines. The tower-like looking ruin on the summit is a solid mass, twenty-eight feet wide, of the most beautiful masonry; to all appearances it formed an angle of some square buildings, the ruins of which are yet to be seen on the eastern side. The cement which connects the bricks is so hard that it was impossible to chip the smallest piece; and for this reason none of the inscriptions can be copied, as they are always on the lower surface of the bricks. It is rent from the top nearly half way to the bottom; and at its foot lay several unshapen masses of fine brickwork, still bearing traces of a violent fire, which has given them a vitrified appearance, whence it has been conjectured that it has been struck by lightning. The appearance of the hill on the eastern side evidently shows that this enormous mass has been reduced more than one half. Only three stories of the eight which it formerly contained can now be discerned. The earth about the bottom of the hill is now clear; but is again surrounded with walls, which form an oblong square, enclosing numerous heaps of rubbish, probably once the dwellings of the inferior deities, or of the priests and officers of the temple. The appearance of the tower of Nimrod is sublime even in its ruins. Clouds play around its summit; its recesses are inhabited by lions, three being quietly basking on its heights when Porter approached it; scarcely intimidated by the cries of the Arabs, they gradually and slowly descended into the plain. Thus the words of the prophet have been fulfilled, "Wild beasts of the desert shall be there; owls shall fill their houses, ostriches shall dwell there, and satyrs shall dance there. Jackalls shall howl in their palaces, and wild hounds in their pleasant places!"

GEMS.

SOCIAL UNION.—From our social union it is that we derive all those dear and tender connexions that constitute the leading charms and happiness of human life; that parents, children, brethren, friends, associates, fellow-citizens, are all enabled to live and act together, in love, and peace, mutual confidence and general security; that our inheritance, the fruits of our industry, and reward of our labours, are quietly enjoyed and freely applied to purposes of benevolence and duty; that under the wholesome administration of those laws which providence hath appointed for our refuge and protection, we fear no open violence, and recur to none for defence and redress; that we are led to cultivate every honest art and liberal refinement of a civil state; to extend our views and intercourse, and know all the enjoyments arising from a fellowship of things divine and human.—*Kirwan.*

IMPATIENCE.—I have seen the rays of the sun or of the moon dash upon a brazen vessel, whose lips kissed the face of those waters that lodged within its bosom; but being turned back and sent off, with its smooth pretences or rougher wafings, it wandered about the room and beat upon the roof, and still doubled its heat and motion. So is sickness and sorrow entertained by an unquiet and discontented man. Nothing is more unreasonable than to entangle our spirits in wildness and amusements, like a partridge fluttering in a net, which she breaks not, though she breaks her wings.—*Jeremy Taylor.*

THE BIBLE.—Whether that book which we call by way of eminence the Bible, be a revelation from God or not, it is matter of fact, whencesoever the information may be supposed to have come, that we are actually in possession of the knowledge of the only true

God, in opposition to all the fooleries of polytheistic superstition. From whatever source, and by whatever channel, this superior knowledge has reached us, such, in the providence of God, is the indisputable fact.—*Wardlaw.*

CARDS.—I think it very wonderful to see persons of the best sense passing away a dozen hours together in shuffling and dividing a pack of cards, with no other conversation but what is made up of a few game phrases, and no other ideas but those of black or red spots, ranged together in different figures. They seem, however, to be the delight of vast numbers of mankind, and even men who profess to have a superiority of taste, and a greater extent of knowledge than others, pass away much of their time in this useless, and often injurious pursuit. Would not a man laugh to hear any one of this species complaining that life is short?—*Addison.*

HAPPINESS.—We pity the folly of the lark, which, while it playeth with the feather, stoopeth to the glass, is caught in the fowler's net; and yet cannot see ourselves alike made fools by Satan, who, deluding us by the vain feathers and glasses of the world, suddenly enwrappeth us in his snares. We see not the nets, indeed; it is too much that we shall feel them, and that they are not so easily escaped after, as before avoided. O Lord, keep thou mine eyes from beholding vanity. And though mine eyes see it, let not my heart stoop to it, but loathe it afar off. And if I stoop at any time and be taken, set thou my soul at liberty, that I may say, my soul is escaped, even as a bird out of the snare of the fowler; the snare is broken, and I am delivered.—*Bishop Hall.*

THE INSTINCTS OF PLANTS.

WHAT a beautiful system is Nature—animate and inanimate. How beautiful she was in my childhood. How beautiful she still is; as I have an opportunity of ascertaining once or twice in the long, long year, when I emerge for a short season from the town's almost endless shadow of buildings, and the unceasing clatter of wheels. I rejoice to say that the smile of Nature rested on my childish days; and her voice early became familiar to my ear; I was not bred in a London nursery or drawing-room; hushed when my shouts of joy were too loud and hearty; chid when a snowy collar or pinafore was unduly soiled; or led forth only when the weather was so superlatively mild that the southern breeze might be permitted for half an hour to fan my wan and faded cheek. No, the wintry winds blew on me unfelt and unrebuked. My brow was bronzed by the hottest sun of summer. The tallest tree deterred me not from capturing the crow's nest near its summit. The widest ditch was jumped over—or into. The awful frown of that most awful of all awful functionaries—the village schoolmaster—did not prevent me from occasionally playing truant. "Stolen joys are sweet." A most true proverb, as I can amply testify. But never since have I experienced a joy equal to the stolen ones of that last long summer's day when I turned my back on school, Dominie, prudence, and all connected with them, and strolled and wandered even until the village spire was lost to my sight, as free from care as the birds that sang around me.

Now could I be other than happy? Was there not the wood echoing with delicious music! with its blackberries—climbing honey-suckle—and snug little naturally formed passages and arbours, with their mossy carpets? Was I not proud as a monarch and far happier? And when I had wearied myself with enjoyment did not Nature present a hundred couches for my choice. Was there not also the little brook, at least three feet deep, of such crystal clearness that every pebble which assisted to pave its bed was visible. What a delicious bath. How speedily did the little green cloth jacket, with the round gilt buttons, and all the other encumbrances of my active limbs disappear to the right and to the left, and then such splashing, and ducking and wading. Never shall I forget that day. I should however have no objection to forget the following, when the Dominie marked his displeasure at my proceedings—on my back.

Deeply did I drink at the fountain of nature, and amply now am I rewarded for it. How many an hour of mental fever has been slaked even by the remembrance. Thanks to a vivid temperament and quick imagination, which are not to be thanked on all occasions, I can look through the smoke and fog of a London day in

November, into the clear open country; and revel at pleasure amid the beauties of Spring, Summer, Autumn, or Winter. Sometimes I am lying under a hedge of hawthorn, covered with blossom. In the bush just above me is a nest of young birds, and the parents are flitting to and fro to seek and to bring food with which to still their clamours. The sky is blue above me, unstained even by the pallid apparition of a cloud; and the sun is carrying joy to the heart of every bird, quadruped, flower, and blossom. Sheep are browsing in the meadow before me, and many a twin lamb is gambolling amid the daisied herbage. At another time I am leaning on the margin of a broad, clear, sequestered stream; perchance gazing on the water lilies; my fit of abstraction occasionally startled and broken in upon, now by the leaping up of the speckled trout, which instantly falls back into the splashing waters and darts away, masticating meanwhile the beautiful blue fly, which a moment before was sporting in the sunbeam, happy in its unconsciousness of danger; and anon by the arrow-like flight of the brilliant king fisher, which, like the form of some loved and buried one seen in a dream, is delightfully recognised for a moment, and then lost for ever. Another time I am on the shore of the vast ocean. Its waves are heaving, plunging, and roaring around me. Distant sails are at one moment seen, and the next lost in the furrowed water. The wind has that peculiar warning sound which precedes a storm, and I anticipate the struggle of brave men with the combined elements—the relaxation of exertion, as fatigue becomes less endurable and hope more faint—the rush to planks and any thing capable of floating—the wreck—the individual battling with the waters, and last, the bursting of the bubble which contained the life-breath of the sunken mariner.

These, and a thousand fancies of the same kind, mitigate the irksomeness of my imprisonment; for such a continued and constrained residence amid brick and mortar is in my estimation. But they cannot equal the enjoyment which I feel when my face is really fanned by the fresh breeze, and the odour of wood burning on the cottage hearths is in my nostrils. How delightful is the scene, whether it consist in the sublime beauties of the mountain, the forest, or the rich luxuriance of the park and the meadow. In either case I see quadruped, bird, reptile, fish and insect, in the state prescribed by nature; therefore happy, and apparently grateful. Then the trees and flowers, are not they, also, susceptible of consciousness? Look at them, one and all, are they not enjoying the air and the sunshine, and gazing with meek and contemplative delight on each other's beauty. Nay, reader, do not look so like a crabbed, matter-of-fact philosopher.

K

Allow me to indulge my fancy, although Linneus may not have sanctioned it. If Hamilton Reynolds was permitted to consider a bird "a winged flower," why may not I be permitted, in imagination, to pronounce flowers to be silent, motionless birds? If the animal has circulating throughout its system, and visiting its most minute parts, a life-sustaining fluid, so also has the plant. If the one performs the functions of respiration, so also does the other. The plant, as well as the animal, seeks the situation best fitted to its nature; proceeds from youth to maturity, thence to old age, and dies, leaving its progeny behind it. If the nightingale makes the air vocal with music, the rose imparts to it delicious odour. If the swan, gliding over the waters, exhibits an emblem of grace, peace, and innocence, the stately and motionless lily does the same. If the linnet awakes with the sun, and grows glad in his early beams, he but resembles the gentle daisy beneath him. If the fowls of the air close their wings and droop their heads in rest, so also do the sweet denizens of the garden fold their many-hued leaves, and bow in odorous slumber.

But, reader, you cry "Pshaw!" and say, "What nonsense is here! what justification can you plead for using the term at the head of your article—the *instincts* of plants?" Do not be alarmed, gentle reader; I am not going to contend that fir-trees emigrate, that dahlias build nests, or that violets hoard dew and rain-drops against a time of scarcity; yet I claim to be allowed to apply the word "*instinct*" to vegetables; and, moreover, claim a peculiar right to use it in reference to them. The instinct of animals, as exhibited in its phenomena, occasionally so nearly resembles reason, that philosophers have much room for dispute as to the nature of the mind of brutes. In the vegetable, on the contrary, where no agency superior to matter exists, no doubt can arise, for every power exerted by the plant to secure its more perfect development, or to surmount obstacles to its progress, must be purely instinctive. The varying necessities of the animal, and the numerous purposes which its Creator intended it to effect, render an indwelling intelligence necessary to it; but the wants and ends of the plant are so simple, that instinct less complex is sufficient, on its part, for the supply of the one, and to effect the other. It is by the agency of these instincts, so beautifully diversified yet exquisitely uniform in their intention and results, that earth presents the wondrous and lovely scene which we behold. Had not her inanimate as well as her animated children been gifted with them, irregularity, deformity, and gradual decay must have ensued.

But, reader, perhaps you still shake your head, and are yet disposed to dispute my right to apply the word "*instinct*" to the vegetable creation. Mark, then, that Virginia creeper; it has run

along and entwined with the iron fence of the little terrace. All the support it needed, it there found, and troubled not itself about the future; but the time has arrived when it must work on a new plan. It has reached the apparently impracticable wall; it cannot writhe between the bricks and fasten itself around them, for the mortar is as obdurate as they; but it puts forth a little feeler, which it makes fast to the upright uncompromising barrier; now it shoots forward again, but soon finding continued support needful, takes another secure hold of the brickwork: thus, by successive efforts, the top is reached and overpassed. What now? Does it still carefully make good its footing, step by step? No, it dangles leisurely downwards, with all the ease and indolence of a citizen who, having toiled hard for a fortune, and obtained it, feels further exertion unnecessary. Look, too, at the branch of that delicious honeysuckle, it has been growing in a straight line, but can no longer support itself in that direction; it therefore proceeds spirally, seeking foreign aid. It has fallen in with a branch no stronger than itself; this is not what it wanted; but by union, the chances of support to both will be multiplied; besides, congenial friendships are the greatest solace of adversity. The better to secure their mutual object the one curves to the left, the other to the right, and presently they secure the support they sought. There, too, is another limb of the same plant, on which equal good fortune has not shone; it, also, has found a branch, but a dead one, which cannot, of course, render it the assistance which its sister derives from *her* companionship. But although unable to aid it in its search for a sustainer, its lifeless stem may be made of some use to increase the strength of our branch, and, accordingly, the latter twists itself around it, in one invariable direction—from the right to the left.

Confine your plants in a room, and observe how the leaves will yearn, and pine after, and turn towards the light. Take that geranium which is looking out of the window as an instance; turn the side which is now to, *from* the light; see what a flutter and bustle there is among the leaves, which are all at work repairing the cruel mischief you have done them. See the myriad heads of clover, which so love the face of the sun, that they hail him in the east at his rising, and continue their steadfast gaze on him even to his setting in the west. What think you of that cruel plant, a downright vegetable spider, the Venus fly-trap, which allures the poor insect into its power by the offer of delicious nectar, and then crushes it in its embrace? Poor fly! your fate is that of many a being gifted with more than instinct, who embraces vice in the search after pleasure, and finds, instead, destruction. Will you tell me that the *hedysarum gyrans* is not full of conscious happy

ness when it raises, and lowers, and whirls its leaves in the calm air and genial sunshine. If you think it is not, impede its operations for a moment, and when the obstruction to its enjoyment is removed, see with what an increase of vigour and velocity it will resume its dance, overjoyed at its release from temporary thralldom.

What will you say, dissentient reader, to the sensitive plant? What to the tamarind-tree and others, which, at night, fold their leaves around the young fruit to protect it from the inclement air? What to the American cowslip, which bows its head to protect its seed from the driving rain; and when these are nearly ripe, erects it again, as if proud in the consciousness of having worthily fulfilled a duty?

What an emblem is the lesser *dodder*—which climbs up the trunks of loftier and stronger plants, and when it has matured means of sucking nourishment from them, abandons its own root, and holds no more direct communication with the earth—of those human beings who, without any foundation of their own, exalt themselves by means of the substance and worth of others!—of the man who, by ductility of principle and skilful meanness, climbs to a station superior to his origin, and then disconnects himself from, and grows ashamed of the dunghill from which he sprang!

How sedulously do the children of the forest, the field, and the garden provide for the well-being of their offspring, and the dissemination of their species! here attaching their seeds to the clothes of passing travellers, to the fur of quadrupeds, or the feathers of birds, thus to be

transported to their future locality; there, by a convulsive effort, ejecting them from the nursery in which they were carefully nurtured, as long as such nurture was required. Behold the barleycorn dropping from its parent stem, and trudging on and on until it finds an eligible spot in which to establish itself! Many cast their progeny on the waters, to be wafted to distant spots, there to spring up, and, in their turn, multiply the localities of their species; while many, again, commit them to the fidelity of the summer breeze. There is the thistle, for instance, which, like the land of which it is the emblem, sends forth its children into every quarter, to take root in, and draw sustenance from every soil, however bleak and barren.

And now, reader, are you satisfied with, or will you tolerate, the title of my paper? I could go on citing instances “an hour by Shrewsbury clock,” or any other clock that goes. But if you are not already convinced, I despair of converting you; therefore, in return for the patience which has enabled you to travel to the end of this long paper, if you still do not like the word “instinct,” as I have applied it, I grant you full permission to substitute in the reading any other which you may consider preferable; and trust that if you cannot sympathize in my botanical fancies, yet that you will concur with me in acknowledging the fact, that all the works of the Creator, as well the inanimate as the sentient, exhibit proofs of the same uniform design, and that they are alike governed by laws beautifully and unerringly adapted to the attainment of the ends for which they were created.

N.

DIVINE CONDESCENSION, HUMAN EXALTATION.

THE condescension of God, as already traced in its downward stages, was not ostentation and display. It could not fail to be productive of certain effects; for as surely as the natural operation of his justice would have tended to destroy, so certainly the operation of his love would have a tendency to save. And it could not be otherwise than that these restorative effects should be commensurate with the *degree* of condescension which he exercised; they would correspond in measure as well as in kind. Accordingly, we find that this exact correspondence obtains: He stooped to earth that we might be raised to heaven: he partook of our human nature that we might be made partakers of his *divine*; he died an ignominious death that we might live a glorified and eternal life.

In glancing at the pinnacle of distinction to which man is raised, let us mark two or three of the more elevated stages in the ascending scale. The lowest to which we shall allude is that of a servant of the most high God. From being the slaves of sin, he advances us into his high and

holy service. He has no *need* of our services, for he is self-sufficient, and could accomplish every thing by the word of his power; or if he chose to surround himself with obedient servants, as a thing becoming his majesty and state, he might have taken them all from the inhabitants of the heavenly world.* They have never revolted from him, never abused his goodness, nor renounced his authority, as we have done; but have ever counted it their highest honour to adore and serve him. How astonishing is it, then, that he should come to seek for servants in this sinful world! that he should call any into his service from among our apostate and guilty race! And yet he does this; and he does it in a manner as though he were really dependent on our services, as though he were unable to conduct the affairs of his government without us; for he not only calls us, he urges, and entreats, and even offers to reward us, though we can

* If the writer mistake not, there is a passage somewhere in the celebrated Howe's works, the scope of which bears a resemblance to this paragraph.

never be otherwise than unprofitable servants. If we neglect his first invitations he repeats them ; if we faint in his service he supports and encourages us ; if we revolt from his service he actually follows and brings us back to it again ; he stoops to do that which we should count it a degradation to do to our fellow-creatures. He reminds us that angels are our fellow-servants ; he calls us co-workers together with himself ; he even engages to applaud us at last in the face of the universe, by saying, " Well done, good and faithful servants, enter ye into the joy of your Lord."

But if it be an honour to be advanced into the *service* of God, how surpassing the distinction of being raised into his *friendship* ! And yet this is his language, " Ye are my friends ; henceforth I call you not servants, but friends." Had he only regarded his people in the light of his servants, he would only have laid his commands upon them ; and even this would have been conferring on them an honour which angels are emulous and happy to enjoy. But he not only entrusts them with his commands, he shares with them his secrets, and honours them with his confidence. He gives them the utmost freedom of access to him, permitting them to come even to his seat, and to enter the secret of his pavilion. They share his sympathy, his counsel, and his aid ; and in return, they feel a growing congeniality with his character, make his cause their own, and rejoice when it is promoted, as though their own interests were advanced. They are conscious of a holy jealousy for the honour of his name, as if it were committed entirely to their custody, or as if their own life and happiness were bound up with it. O how exalted and how ennobling is this relation to God ! and yet it is their privilege to sustain it : they are known in heaven, though they may not be on earth, as the *friends of God*.

But they sustain a relation still higher, if possible, than this : " Beloved," says an apostle, " now are we the *sons of God*." " Ye are all the *children of God*," says another apostle, " by faith in Christ Jesus." " And if children, then *heirs* ; heirs of God, and joint-heirs with Christ." " O," said one of the Malabarians converts appointed by the Danish missionaries to translate a catechism, in which believers are called the "*sons of God*,"—" O it is too much ! let me rather render it, ' they shall be permitted to kiss his feet.' " But no, it is not too much : " It is just like him," said a converted negro woman, with sublime moral simplicity, when speaking of his unutterable gift of Christ for our redemption. Inconceivably great as the gift is, " it is just like him ;" and unspeakably great as the privilege is of constituting believers his children, " it is just like him ;" it is no figment of the imagination ; the honour is realized to the fullest extent. They are renewed after his likeness, and by the spe-

cial operation of his own Spirit. They are clothed with the robes of his righteousness ; are sustained with manna from heaven, and enjoy the training and tuition of a Divine teacher ; while every step they take brings them nearer to an inheritance worthy of those whom he has adopted as his children and his heirs. " Beloved, now are we the sons of God : " and when we look down to the depth from which he has raised us, we may well be astonished at the height of our present elevation ; but when we look up towards the summits which we are yet destined to attain, we feel that " it doth not yet appear what we shall be." Great as the honour is which he has already conferred upon us, it is only the beginning, the pledge of what he purposes to bestow on us in heaven. High as is the exaltation to which he has already raised us, we are still rising, and shall continue to ascend, till we have left sin, and death, and hell at an infinite depth below us, and find ourselves placed at the right hand of God.

Now, looking at the history of this exaltation, we may remark that, like that Divine condescension to which it is owing, it is marked by distinct and successive stages, by which the Christian is carried from glory to glory till he has reached the summit of perfect bliss. What an important moment in his history is that, when the voice of God first calls him, and induces him to consider his ways. The period of conversion comes, and he arrives at another stage : he now cordially believes, and embraces the Gospel ; his sins are forgiven ; he draws the first breath of a new life, and aims at heaven. Henceforth, his course may be marked by numerous vicissitudes—but they all form so many steps, by which he rises towards heaven. The period of death comes, and he arrives at another and a most important point—he escapes from the state in which he had been walking by faith, and finds himself standing in the brightness of the throne of God ; he quits his conflicts and temptations, and finds himself in a world where all is security, holiness, and bliss ; he rises as by one mighty bound from earth to heaven. Nor is this the summit of his dignity. The morning of the resurrection will dawn, and he will reach a higher point of glory still. His body will be raised from the low chambers of the grave, and be fashioned like unto Christ's glorious body. The hour of judgment will arrive, and constitute another stage in his advancing career ; he will then be acquitted from every charge, welcomed as an heir of heaven, and confirmed in his title to eternal life. And do you think that even then he will have reached the limits of his glory ? That glory is an ocean—and he will only then be just launched forth on its shoreless expanse. Even then he will be heard saying, as he surveys the interminable prospect of blessedness that stretches before him, " it doth not yet appear what we shall be ; but this we know, that we are like him, for now we

see him as he is;" and this we believe, that in proportion to the depth to which he stooped in order to raise us, in that proportion will be the height of our exaltation, for ever advancing in endless progression.

To this advanced stage of their exaltation, however, Christians have not yet attained. Some of them are only just emerging into spiritual light and life; others are in the midst of their career toward heaven; others have just arrived at the point at which their spirits pass to the throne of God; and others have long been familiar with the scenes and the society of heaven. Were the operation of the grace of God to terminate at this moment, were the affairs of his kingdom to be wound up at once, how astonishing the effects which his condescension has already produced! How many has it raised to the enjoyment of eternal life! What a tide of happiness has it poured through the world—bearing on its bosom to the haven of rest an innumerable multitude, every one of whom would else have perished in the blackness of darkness for ever! But it shall not cease to operate till it has compassed the salvation of all his people; and then, and not till then, will it be adequately appreciated and adored. But then, when all the objects of his love—the fruits of his condescension—shall stand upon the mount of God; when they shall look up and gaze upon the glories of him who sits upon the throne, and then look back, and down upon the cross, and remember

that he once hung upon it, and trace the various stages through which he passed till he reached it, what an amazing impression of his condescension will they have, and what a theme for praise. And when they shall contrast their divine exaltation with their former depression, when they shall find that they are without fault before the throne of God, that they are walking in the society of angels, are raised to the enjoyment of all that heaven contains, and then look down at the state in which his condescension found them, and, still lower, at the state of perdition from which his grace has saved them, what a view will they have of their high exaltation, and what a subject for gratitude to him "who raiseth up the needy out of the dunghill, that he may set him with princes," even the princes of heaven.

But the adoration and praise of heaven must begin on earth. Christians are not strangers to these emotions now. It is by these, and the influence which these have upon their life, that they are distinguished from an ungodly world. The Saviour has spoken to them—and they have listened, wondered, and obeyed. He has raised them from the dust, and they have followed him. He has shown them his cross, and they feel that they are not their own. He has pointed them to the open gate of heaven, and they are hastening and ascending to reach it. He has constituted them his friends and his children, and they are advancing to take possession of their inheritance, and to share his glory.

WILLIAM WORDSWORTH.

SECOND ARTICLE.

POETRY is one of the natural elements and accompaniments of our lives—it displays its abounding influence in all our thoughts, feelings, designs and actions, and it develops itself in every kaleidoscopic change of character and circumstance within our hearts, when we may perhaps in the least degree suspect it. Those who are even the most ready and willing to deny the power of its inward inherent influence upon their minds, are the very beings over whom it is shedding the early dews of its pathos and passion, and who, placed as they thus are within the boundary and sphere of a new and enlivening existence of mental happiness, are dazzled and confused by the wondrous creations of thought and fancy, which are ever springing up within and around them. The development of these ideas are made abundantly evident to the close observation of any one who, with that common acuteness which is naturally inherent in every breast, will closely cultivate a mind which is thus every day increasing in vigour, and inhaling with every inspiring breath the rich feelings of delight, which thrill with a gladden-

ing influence through the wide and boundless beauty of the universe around them. The winds have for them a more freshening and delightful fragrance, a louder and more spirit-stirring music; every harmony of which brings back some buried memory of mournful sorrow, or some joyous and bridal thought, which throws alternately over the past the pallid and rosy colourings of hope—robing the days of our mortal stay upon the earth with richly abounding associations of joy and gladness, which become in themselves the very essences and materials of that serene-born poesy which, like the awful voice of some oracular god, is ever stirring within them. They will linger in the advancing years of youth over the lovely and cherished flowers which they planted in the garden of their childhood, and weep with the gentleness of the earlier affections over the passing echo of some olden nursery hymn. But in the creation and growth of this rich and delightful enthusiasm, there will at times flash over the mind rich and ennobling thoughts; which, like stars in the depths of midnight darkness, will arrest the vagrant fancy with

the splendour and brightness of their illumination. And if there be one spirit whose quiet researches among the charities and gifted feelings of the human heart, as evidenced in the subdued tone of his gentle poetry, has led one human creature from dwelling upon the outward gaze of the rude and garish world, and drawn him by the chords of a tender charity to the inner sanctuaries of deep and thoughtful feeling within his own bosom—that one high and pre-eminent above all others—is William Wordsworth. Every one who has perused his poetry, with that contemplative and reverent attention which its deep beauty and quiet pathos demands—has risen up from its study both a wiser and a better man. Within his pages are developed “thoughts that lie too deep for tears”—feelings that when once aroused, fill the heart with “a joy for ever,” whilst over all is ever heard in a sweet and happy chorus the voice of “the still sweet music of humanity.”

In the rich and golden days of the Grecian poesy, when the Naiad sat alone by the fountain—the Dryad beneath the spreading oak—and the Oread in the cool recesses and deep shadows of the lonely glens, there was spread over the natural world of the creation the delightful splendour of a poetry of being, which identified and mingled itself with the every day contemplation of the dwellers of the land, even to the golden mythology and mystic rites paid to the deities whose supremacy and power they invoked, worshipped and adored. But the retired privacies of the domestic affections—the hidden *penetralia* of the heart, where love and duty had their birth-place—these were recognised only by the cold and cautious philosophy which was the predominant agent amongst the different schools and sects of that past family of the moral world. But the private charities of life which were then suppressed and buried, have in the era of our existence been called back, and revived, and cherished with a new and happier life; and, from the quiet home and the lowly dwelling, the inspiration and power of poetry has been sent forth abroad over the wide plains and dominions of nature. Peace, and charity, and friendship have been proclaimed in the forest-glades—a moral and thoughtful lesson for the heart's best feelings has been gathered from leaves, and plants, and gentle flowers—and the spirit of mortal man and the spirit of nature have claimed for themselves good and gracious feelings of a close and united sympathy and companionship; for themselves they have formed a bond of brotherhood together, which can only be parted asunder when the links and harmonies of all social and moral creations are broken up, shattered and destroyed. The Spirit who sent us forth into this world with the mark of sin and sorrow upon our forehead—and the stinging pang of the serpent within us—has not left us utterly unredeemed. The beauty and divinity of Paradise still linger like a me-

mory and a promise upon the earth, and hope points upward to that heaven whose light she has brought down amongst us. Poetry like that of Wordsworth's is born and grows amid the temperate yet glowing splendour of such rain-bowed brightness.

The two following poems have been quoted a thousand times—we have heard them whispered to us in dreams—and we quote them again like the words of the poet of all true and sober wisdom :—

TO THE CUCKOO.

Oh, blithe new-comer! I have heard,
I hear thee and rejoice.
O cuckoo! shall I call thee bird,
Or but a wandering voice?

While I am lying on the grass
Thy twofold shout I hear,
That seems to fill the whole air's space,
As loud far off as near.

Though babbling only to the vale,
Of sunshine and of flowers,
Thou bringest unto me a tale
Of visionary hours.

Thrice welcome, darling of the spring!
Even yet thou art to me
No bird; but an invisible thing,
A voice, a mystery;

The same as in my schoolboy days
I listened to; that cry
Which made me look a thousand ways
In bush, and tree, and sky.

To seek thee did I often rove
Through woods and on the green;
And thou wert still a hope, a love:
Still longed for, never seen.

And I can listen to thee yet;
Can lie upon the plain
And listen, till I do forget
That golden time again.

O, blessed bird! the earth we pace
Again appears to be
An unsubstantial, fairy place,
That is fit home for thee.

—
She was a phantom of delight,
When first she gleamed upon my sight,
A lovely apparition, sent
To be a moment's ornament;
Her eyes as stars of twilight fair,
Like twilight's, too, her dusky hair;
But all things else about her drawn
From May-time's brightest, liveliest dawn,—
A dancing shape, an image gay,
To haunt, to startle, and waylay.
I saw her upon nearer view,
A spirit, yet a woman too!
Her household motions light and free,
And steps of virgin-liberty;
A countenance in which did meet
Sweet records, promises as sweet;
A creature not too bright or good
For human nature's daily food;
For transient sorrows, simple wiles,
Praise, blame, love, kisses, tears, and smiles.

And now I see, with eye serene,
 The very pulse of the machine ;
 A being breathing thoughtful breath,
 A traveller between life and death ;
 The reason firm, the temperate will,
 Endurance, foresight, strength, and skill ;
 A perfect woman, nobly planned,
 To warm, to comfort, and command ;
 And yet a spirit still, and bright,
 With something of an angel light.

Now, in these two simple yet beautiful poems, how much true poetry and charming philosophy is contained ! how much of that delightful spirit which subdues and sanctifies the best feelings of the heart and the affections ! and it is this, and mainly this, which has been at once the bane and the antidote, the for and the against, the yea and the nay of Wordsworth's poetry ; it has raised up around him "troops of friends," it has gathered against him hordes of savage and insane critics, who, unable and incompetent to estimate the true value and standard of his genius, are content to employ the base and savage materials in their power, and endeavour, by all unjust and unholy means, to calumniate and vilify him. To this general rule there have been some exceptions, of a nature at once peculiar and startling in themselves : we allude to the circumstance that there are, even in the present day, to be found many who, whilst they take a deserved and esteemed rank amongst those who may justly claim the prerogative of genius and talent as a birthright, do not yet own to themselves that principle which would admit the poetry of Wordsworth to occupy an high and esteemed place amid the modern literature of the land. We are acquainted with a gentleman whose reputation as a literary character is highly and deservedly respectable, whose writings and talents, whether as author, editor, or compiler, are greatly read and appreciated, yet to whom the revelations of the calm and philosophic wisdom of Wordsworth's poetry has been but as a dark and solemn adumbration, as a dim and starless darkness, over which the light of the bright and purple dawn has not yet arisen.

Haslitt, in his "Lectures on the English Poets,"

says that poetry is the language of the imagination and the passions, it is the universal language which the heart holds with nature and itself. It is not a mere frivolous accomplishment, as some persons have been led to imagine,—the trifling amusement of a few idle readers or leisure hours ; it has been the study and delight of mankind in all ages. Wherever there is a sense of beauty, or power, or harmony,—as in the motion of a wave of the sea, in the growth of a flower that "spreads its sweet leaves to the air, and dedicates its beauty to the sun,"—there is poetry in its birth. It is "the stuff of which our life is made ;" all that is worth remembering in life is the poetry of it ; it is that fine particle within us that expands, rarifies, refines, raises our whole being ; without it, "man's life is poor as a beast's." Such is the language of one of our best modern critics, and on which the "Quarterly Review" wasted a few pages of most absurd and insane criticism. The genius of the departed Haslitt has received, and is still receiving, that justice at the hands of tardy, though correct, criticism, which will rise superior to all the slavish sarcasm of cold-hearted and malignant libellers.

We return to our author ; and the reader who takes these volumes of Wordsworth in his hand, and goes with us through this delightful series of poems, will find that we are now standing upon the shining edge of that golden threshold on which he has built up that splendid superstructure of "poems of the imagination" which will cherish and support his fame as a poet until time itself shall be no more. In this series are contained many of those poems which filled up his last single volume of "Yarrow Revisited ;" there are, therefore, among them, the later efforts of his mind, and the more powerful and vivid impressions of a rich and philosophic imagination, sobered, but not saddened, by the declining sunset of life, and breathing, through every verse, the strains of a spirit purified and elevated from this world's care and toil, and devoutly and reverently chanting the hymns of mortal vanities and immortal rewards.

TO THE MEMORY OF MRS. HEMANS.

O ! silent lies thy hallowed lyre
 Whose strains our spirits loved so well,
 Whose sounds could holy thoughts inspire,
 And bind the soul with magic spell.
 'Tis broken—and no more, no more,
 Thou honoured one, thou loved, and wept,
 Thy trembling hand may wander o'er
 Chords where the soul of music slept.

Thy spirit, that so oft had known
 And communed with diviner things,
 Hath risen to heaven's eternal throne,
 And mid the choir angelic sings.

We may not mourn thy upward flight
 To yonder calm and radiant shore,
 Where glorious visions meet thy sight—
 Where griefs nor ills can reach thee more.

Thy strains, prolonged by music's charm,
 Shall wake the soul with gentle power,
 Shall passion's fiercest rage disarm,
 And soothe afflictions saddened hour.
 Sleep sweet beneath the cypress tree,
 That flings its shadow o'er thy tomb ;
 We ne'er may cease to think of thee,
 When springs return, and flow'rets bloom.

T. A.

THE BLIND PREACHER.

[The late William Wirt, the Attorney General of the United States, was perhaps less an author than an orator and statesman; yet, among the pages of "The British Spy," and numerous other miscellaneous works from his pen, there may be found many marks of genius and talent of a very high order; sufficient indeed to warrant the conclusion that if he had devoted himself to the penurious pursuits of literature, he would have been unsurpassed in almost any species of composition. The following little sketch will afford no unfavourable evidence of his style and talents as a miscellaneous writer.]

It was one Sunday, as I travelled through the country of Orange, that my eye was caught by a cluster of horses tied near a ruinous old wooden house, in the forest, not far from the road-side. Having frequently seen such objects before, in travelling through these States, I had no difficulty in understanding that this was a place of religious worship.

Devotion alone should have stopped me, to join in the duties of the congregation; but I must confess, that curiosity to hear the preacher of such a wilderness, was not the least of my motives. On entering, I was struck with his preternatural appearance. He was a tall and very spare old man; his head, which was covered with a white linen cap, his shrivelled hands, and his voice, were all shaking under the influence of a palsy; and a few moments ascertained to me that he was perfectly blind. The first emotions that touched my breast were those of mingled piety and veneration. But how soon were all my feelings changed! The lips of Plato were never more worthy of a prognostic swarm of bees, than were the lips of this holy man. It was a day of the administration of the sacrament; and his subject was, of course, the passion of our Saviour. I had heard the subject handled a thousand times; I had thought it exhausted long ago. Little did I suppose that in the wild woods of America, I was to meet with a man whose eloquence would give to this topic a new and more sublime pathos than I had ever before witnessed.

As he descended from the pulpit to distribute the mystic symbols, there was a peculiar, a more than human solemnity in his air and manner, which made my blood run cold, and my whole frame shiver.

He then drew a picture of the sufferings of our Saviour; his trial before Pilate; his ascent up Calvary; his crucifixion; and death. I knew the whole history; but never until then had I heard the circumstances so selected, so arranged, so coloured! It was all new; and I seemed to have heard it for the first time in my life. His enunciation was so deliberate, that his voice trembled on every syllable; and every heart in the assembly trembled in unison. His peculiar phrases had that force of description, that the original scene appeared to be at that time acting before our eyes. We saw the very faces of the

Jews; the staring, frightful distortions of malice and rage. We saw the buffet; my soul-kindled with a flame of indignation; and my hands were involuntarily and convulsively clenched.

But when he came to touch on the patience, the forgiving meekness of our Saviour; when he drew, to the life, his blessed eyes streaming in tears to heaven; his voice breathing to God a soft and gentle prayer of pardon on his enemies, "Father, forgive them, for they know not what they do!"—the voice of the preacher, which had all along faltered, grew fainter and fainter, until his utterance being entirely obstructed by the force of his feelings, he raised his handkerchief to his eyes, and burst into a loud and irrepressible flood of grief. The effect was inconceivable. The whole house resounded with the mingled groans, and sobs, and shrieks of the congregation.

It was some time before the tumult had subsided, so far as to permit him to proceed. Indeed, judging by the usual, but fallacious standard of my own weakness, I began to be very uneasy for the situation of the preacher. For I could not conceive how he would be able to let his audience down from the height to which he had wound them, without impairing the solemnity and dignity of his subject, or perhaps shocking them by the abruptness of his fall. But—no; the descent was as beautiful and sublime as the elevation had been rapid and enthusiastic.

The first sentence, with which he broke the awful silence, was a quotation from Rousseau: "Socrates died like a philosopher; but Jesus Christ like a God!"

I despair of giving you any idea of the effect produced by this short sentence, unless you could perfectly conceive the whole manner of the man, as well as the peculiar crisis in the discourse. Never before did I completely understand what Demosthenes meant by laying such stress on delivery. You are to bring before you the venerable figure of the preacher; his blindness constantly recalling to your recollection old Homer, Ossian, and Milton, and associating with his performance the melancholy grandeur of their geniuses; you are to imagine that you hear his slow, solemn, well-accented enunciation, and his voice of affecting, trembling melody; you are to remember the pitch of passion and enthusiasm to which the congregation were raised; and then the few moments of portentous, death-like silence which reigned throughout the house; the preacher, removing his white handkerchief from his aged face, (even yet wet from the recent torrent of his tears,) and slowly stretching forth the palsied hand which holds it, begins the sentence, "Socrates died like a philosopher"—then pausing, raising his other hand, pressing them both, clasped together, with warmth and energy, to his breast, lifting his "sightless holes" to heaven, and pour-

ing his whole soul into his tremulous voice—"but Jesus Christ—like a God!" If he had been indeed and in truth an angel of light, the effect could scarcely have been more divine. Whatever I had been able to conceive of the sublimity of Massillon or the force of Bourdaloue had fallen far short of the power which I felt from the delivery of this simple sentence.

If this description give you the impression, that this incomparable minister had any thing of shallow, theatrical trick in his manner, it does him great injustice. I have never seen, in any other orator, such a union of simplicity and majesty. He has not a gesture, an attitude, or an accent, to which he does not seem forced by the senti-

ment he is expressing. His mind is too serious, too earnest, too solicitous, and at the same time too dignified, to stoop to artifice. Although as far removed from ostentation as a man can be, yet it is clear, from the train, the style and substance of his thoughts, that he is not only a very polite scholar, but a man of extensive and profound erudition. I was forcibly struck with a short yet beautiful character, which he drew of Sir Robert Boyle; he spoke of him, as if "his noble mind had, even before death, divested herself of all influence from his frail tabernacle of flesh;" and called him in his peculiarly emphatic and impressive manner, "a pure intelligence; the link between men and angels."

THE SALMON FISHER.

A TALE.

CHAPTER II.

To Rholf, then, the man about whom I had felt such indescribable concern, I was indebted for my life, it was his hand that had rescued me from a watery grave. He observed that my attention was intently fixed upon him, and drawing suddenly back, quitted the apartment. I spoke to Donald as he retired, and the sound of my voice recalled him to the bed, and in the tones of mildest compassion he inquired into the nature of my feelings. At first I imagined my answers were not altogether rational; for although, strange to say, I knew perfectly well the features of Rholf and of my servant, and that I was in safety, I had still a second feeling hanging about me, of mental as well as bodily imbecility, which, as I exerted myself to appear collected, to scatter my faculties, and to represent the past and passing circumstances like those of a dream. The salmon fisher, more sensible than Donald of my weak state, did not again offer any interrogatories, but after administering some restorative, drew the curtains, and motioning the servant to seat himself in an easy-chair by my side, resigned me to repose.

A deep sleep, occasioned, possibly, by the nourishing opiate I had taken, insensibly overcame me, from which, on the following morning, I awoke considerably amended and refreshed. Donald, who, as well as Rholf, had sat up all night, was still by me. I spoke to him of the accident in the most decided manner, and expressed a desire to rise and thank my preserver. The salmon fisher, who could clearly distinguish my accents from the next apartment, came immediately towards the chamber, and cautioned me not to be in too much haste; nor would he suffer me to quit my bed till I had taken some refreshments, which he himself handed in a way that bespoke how inferior must be his present condition to that for which he had been educated.

I found myself so well during the morning, that, fearing to become a tax upon my host, I purposed continuing my journey homewards. At a sign from me Donald withdrew, I being anxious to express my private thanks to the salmon fisher, whose dignified demeanour more and more astonished me.

When we were alone, "Sir," said I, "you cannot fail to have observed the amazement with which the presence of such a person as yourself, considered as a settled inhabitant of this place, has inspired me. When you reflect on the gratitude due from me, I trust it will form some excuse for the abrupt disclosure I am about to make. Unseen by yourself, I noticed with what a melancholy deportment you yesterday quitted this cottage. I also marked your gloomy abstraction on the strand of the Frith; both indicate that you are unhappy. Far be it from my wish to dive into the secrets of another's care, although I am convinced you are not what you seem, nor perhaps are these rocks, wildly beautiful as they must appear to the eye of inquiry, worthy to contain such an inhabitant. You have saved my life. All I have is yours; and if you will but permit me to share it with you, it will render me the happiest of human beings."

The salmon fisher, with a proud look, which, though it seemed to throw me at an immense distance, contained nothing of a scornful or indignant nature, listened calmly to my discourse. At the conclusion, "Young gentleman," said he, coldly, "the world has no longer any charms for which I would resign the solitude of this cabin; the better world I inhabit is within myself, in the recollection of past times; nor can I mention a single service I could derive from mankind beyond the common affairs afforded by the unoffending salmon fishers with whom I am content to associate. With regard to the pre-

servation of your life, that I was permitted to accomplish it, repays me tenfold." A deep pause followed, during which Rholf sat with one elbow on the table, supporting his head with his hand, seemingly plunged in thought.

"If," said I, rising, "you will not permit me to serve you, at least, in case you should hereafter alter your resolution, suffer me sometimes to visit your retirement." Rholf bowed his head rather formally than complacently. "And know," I continued, "that the name of the person whose life you have been the means of saving is N * * * *."

As I uttered the last word, a sudden and terrible convulsion seemed to relax the very frame of my host; his knees smote each other, his head and hands trembled violently, and, with a hollow, sepulchral voice, "Are you," he exclaimed, "from Cumberland?" My assent seemed like a bolt of fire directed to his heart; his death-like eyes rivetted themselves upon my features, and passed fearfully over my black apparel. In vain his feeble grasp endeavoured to fix itself on the arms of the chair for support; a cold perspiration trickled down his brow, and he appeared sinking to the earth." My attempts to assist him visibly increased rather than diminished his perturbation; till at length, with a groan of the severest anguish, he became nearly insensible. I had scarcely time to reflect ere the door of another apartment was suddenly thrown open, and a young lady, simply attired, but of uncommon beauty, hastily entered, and seeing the situation of the salmon fisher, hung affectionately over him, wetted his cheek with her tears, and endeavoured to recall him by the most heart-touching endearments. At the sound of her voice he struggled, by a sudden effort, to recover himself; the colour again returned to his lips, his reanimating eyes turned with a gaze of grateful affection upon hers, which beamed with that celestial blueness supposed only to emanate from the pitying looks of angels. "Dear Stella," ejaculated he, "it is ever now." The damsel placed one of her fair arms round his neck, while, with her disengaged hand, she gently held his forehead.

At that instant the salmon fisher again investigated my countenance, with an expression little short of horror. I perceived that the simple disclosure of my name had rendered me, in some way or other, obnoxious, and offered to withdraw. Rholf, who watched my motions, suddenly took Stella by the wrist, and rising from his chair with dignity, "Sir," said he, in the tone of one accustomed to address few superior to himself, "you shall not leave us thus. The malady under whose influence you beheld me has of late become almost natural to my constitution; it is sudden and appalling in its attack, but equally rapid in its duration. It arises from a cause centered in the heart; a cause that one day may be blazoned to yourself and to the world."

I again seated myself, in compliance with the

salmon fisher's example; and Stella having filled two drinking cups with wine, presented them separately to us. Ere I tasted my cup, I bowed to the lady and to Rholf, who returned the compliment by draining his goblet to the very dregs, with an eagerness indicating an internal burning despair, which he would fain that draught should quench for ever. His fair companion noticed his wildness, and placing on the edge of the table a sort of lute, drew her fingers slightly across the chords. "Stella," said the recluse, "is my physician; you shall judge of the medicine she prescribes, it is the sweetest antidote; I am mistaken if its influence displease you." He smiled on her; she repaid his tenderness with some of the most enchanting and assuasive notes. It was a Swiss ballad. At that time I but imperfectly understood the language; I have since indifferently translated it as follows, and named it

"THE WITHERED ROSE"

"The withered rose on Julia's brow
Was that her parting hero gave,
Ere forth in glory's ardent glow
He rode to seek a soldier's grave.

"And ever when the moonlight fell
On Alpine heights, on glacier steep,
Alone she sought the haunted dell,
O'er Albert's turf to kneel and weep.

"Though summer but to autumn yields,
Though autumn's loveliest charms decay,
A coming spring shall strew the fields
In beauties fair and sweet as they.

"But blighted hearts no more shall bloom,
Not their's spring's renovating breath:
Their only solace is the tomb,
Their only hope—repose in death.

"To Albert's grave, where Julia died,
The mountain lads and lassies drew,
They laid her by her lover's side,
And hung the bier with streaming rue.

"With violets her shroud they graced,
With pale tufts and lilies fair;
But on her broken heart they placed
The wither'd rose that bound her hair."

She paused; the mournful melody of her tones seemed to have subdued every passion of the salmon fisher into a sort of pensive yet agreeable sadness. He sat with his eyes fixed on the floor, and I thought I discovered tears in them; there was nothing singular, however, in such a circumstance, for I felt congenial drops in my own. The voice Stella possessed had sufficient influence to have melted the most rigorous heart; and I should have argued decidedly against that which could have withstood tones so touchingly plaintive.

When the last cadence of her song had expired, Rholf turned towards the beautiful minstrel, "Beloved Stella," said he, "were it possible for me to know happiness in this world, I am persuaded it would be conferred by yourself." "Ah! sir," continued he, addressing himself to

me, "as you have heard she is perfectly mistress of her heart, she is acquainted also with every fibre of my breast, and is the only one on earth who has the power to tranquillize it even for a moment."

"Surely," answered I "whatever be the cause of your too-evident unhappiness, the assiduities of friendship, the impulse of gratitude——" I paused. Rholf, methought, was aware he had said too much; he appeared half offended with me.

"We will never talk farther," added he, "of things which now, alas! can never be remedied, and the baneful ravages of which cannot proceed to a far greater extent."

I heard, at this moment, the voice of Donald through the window, conversing with a little Scotch girl, who, it seems, was Stella's sole attendant; the sound relieved Rholf. It was plain he now wished me to depart, for, rising from his seat, he looked through the glass, and reminded me that it was my servant. I instantly prepared for my departure. Stella had left the room, but at a summons from the salmon fisher returned, and with the utmost amiability expressed her wishes for my welfare. I confess that her beauty, probably enhanced by the romantic light in which I beheld her, had produced almost as unusual an effect upon me as that of her mysterious companion who had saved my life. As I quitted the cottage the salmon fisher took me by the hand, and, for a while, gazed steadfastly in my face. There was something awful in his manner and look that appalled and left me without the power of utterance. I was afraid to renew my tender of services; I was equally afraid to solicit permission occasionally to visit him. At length he interrupted my embarrassment—"You are quite sure you come from *Cumberland*?" said he.

"On my honour," answered I, almost trembling. The agitation I was in did not escape him. He forced a faint smile over his haggard brow, and shaking me vehemently by the hand, ejaculated, "God bless you! God bless you!" and immediately rushed from my presence.

As I slowly pursued my journey homeward, I could think of nothing but the interesting salmon fisher and the beautiful Stella. In my nightly dreams both stood again before me; day followed day, and they were still as fresh and active in my mind as at the very moment in which I first beheld them. I repented a thousand times that I did not venture to ask whether Stella was the wife or the sister of Rholf. Three weeks passed away. I conceived that Rholf did not desire my society; I was convinced it would be an intrusion, nevertheless, I wished to see him again, and therefore despatched Donald, not to the salmon fisher, but with a present to Stella. He returned with the intelligence that Rholf, since my departure, had exhibited such symptoms of

insanity, as no one but Stella had the power to subdue. He was repeatedly seen, almost all night, talking to the white breakers in a most incoherent manner. To the entreaties of the fishermen he invariably opposed desperation; but when Stella, accompanied by her solitary attendant, sought him, he ever readily suffered himself to be conducted home. Hurt as my feelings were by this intelligence, I still felt a secret satisfaction, since it not only allowed me to visit my preserver, whose unhappy state demanded the attention of a friend, but would enable me again to see and converse with Stella. I immediately hastened towards the glen, and at knocking at the door of the salmon fisher, was not a little amazed when Rholf himself appeared to the summons. He started at my presence, but his surprise immediately vanished in an almost courteous smile of welcome. "I thought you would be here," said he; "I am glad it is so. Come in." On my entrance he handed me a chair; and seeing that I looked somewhat pale, inquired whether I had been ill. Upon my assuring him that my greatest indisposition arose from the anxiety I had endured on his account, he did not, as formerly, repay me with a frown, but took me kindly by the hand—"I have learned," said he, "that you possess an excellent and a noble heart; I have conversed with the objects of your benevolence, I have heard them bless your name in the fulness of their gratitude; and could I receive benefits I would do it from your hand. But my care is of the mind, which no commiseration can remove, no bounty of earth alleviate; it is of such a nature that, if known, *you*, of all mankind, would abhor even the creature who has snatched you from the very jaws of death."

This conversation taught me readily to believe that Rholf was indeed labouring under a derangement of his intellects, and I reproached my own powers of understanding that I had not perceived it sooner. In a short time Stella, who recognised my voice, made her appearance. What were my sufferings when I beheld her! I scarcely deemed it possible that three weeks could have effected such a change. She was no longer blooming, and wore only the fading semblance of her former self; her eyes seemed to have lost their radiance, it was evident they were dimmed by frequent watching and weeping. The fisherman noticed the earnestness with which I contemplated her. "My poor Stella," said he mournfully, "is a victim sacrificed at the shrine of another's sorrows; she sympathizes too deeply in mine. O how would it relieve me in my dying moments to learn that she had found wings like a dove, and had flown away into the wilderness to be at rest."

This sentence affected the poor girl almost beyond endurance; she reclined her head upon the shoulder of Rholf and shed tears. I had seen her in a similar situation on a former visit

to the cottage; her looks were then those of pity, they now teemed with despair. "What can have occurred," thought I, "to effect this fatal revolution?" Three weeks ago, ere I entered this abode, Stella, though doubtless far from happy, was not wretched, she certainly had hope to cheer her; now even that comforter no longer inhabits her bosom. Rholf, too, though miserable, was not frantic. The words '*you*, of all mankind, would abhor me,' recurred forcibly to my recollection. What power could I possess more than another over his misfortunes, or they over me? Had I brought with me a deadly spell to destroy the beings I felt myself most inclined to serve and love?"

Rholf interrupted my internal soliloquy by speaking to me in a most collected manner. I had previously expressed my intention to stay some little time in the glen, that I might participate in the employment of the fishermen, a sport for which I expressed a fondness; in fact, I hoped by passing a few days with Rholf, and by rendering myself familiar to his habits, he would become inclined to indulge me with his confidence, and eventually suffer himself and Stella to be transplanted to a soil more congenial, as I supposed, to their birth. Rholf regretted that the extent of his habitation would not admit of my accommodation within it. I assured him that Donald had already formed every arrangement in a cottage at no considerable distance. He appeared satisfied, and even pleased, at the intelligence. His serenity imparted something like a ray of peace to the bosom of Stella. She replied to my observations on the beauty of the surrounding country, with the vivacity that ill accorded with the deadly paleness of her cheek, and in the evening, at the salmon fisher's own request, accompanied us in a ramble along the cliffs. The night, as it overtook our steps, was clear and tranquil, the blue ether appeared scattered over with innumerable stars, and the rays of the moon, twining themselves about the frothy breakers which lashed the shore at our feet, fashioned themselves into a thousand fantastic forms. Stella had brought her lute; she sung to us the romantic ballads of her own country, and the murmur of her harmonious chords, as it melted gradually away in the deep stillness of the hour, seemed like the distant hymnings of angels inviting mortals to repose.

My senses imperceptibly wandered into regions far beyond the earth. Rholf also was wrapt in contemplation, his eyes fixed on the widely-spangled heavens; he spoke indistinctly to them. The sound of his voice roused me; I only heard him articulate the word "Maker." When Stella

concluded, he started abruptly from the rock on which he had been seated, and mechanically taking one of her hands, placed it in mine; he said something as he did so, which I could not comprehend. Stella, with a degree of admirable delicacy, almost immediately unloosed herself from my grasp. I could not be hurt or offended at the manner in which it was done. Rholf took no further notice of the circumstance, but as we returned, spoke like a person of education and intelligence on different subjects. That night, as I sought my pillow, a number of pleasing anticipations crowded my mind: I argued, from the events of the evening, that a number of delightful years would succeed, not only to crown my hopes, but to strew the roses of peace over the rugged path of despairing calamity.

The next morning Rholf was even better; he informed me that he had been up the best part of the night, writing his own history, which he intended for my perusal in the evening. He had come to a full determination of making me his confidant. Upon my endeavouring to express the feelings that such a mark of esteem awoke within me—"Stay," said he, "till you have read my story; you will not then think of me as you do now. But you must promise to grant me a request which I have made there." I readily complied, not deeming it possible that he who had refused all that I possessed, would make a demand I could hesitate to comply with.

The day passed in even a more agreeable manner than the preceding one. Rholf joined me in the pursuit of the fishermen. Stella hailed our return in the evening with a gladness which transported me. When I withdrew for the night, Rholf followed me to the paling of the cabin—"Remember," said he, taking a packet from his breast and placing it in my possession, "that I rely on the benevolence of your character to judge with lenity." I could only press the salmon fisher's hand. He was considerably agitated. "To-morrow," said he, in a hurried voice, "to-morrow you will know all, and you will hate me. Good night!" He walked a few paces further, leaning on my arm, in silence; and then repeating vehemently his last exclamation, returned with rapid steps to the cabin. I watched him till he disappeared; and a light burning in his chamber, which I had formerly occupied, informed me that he had retired to repose; I then, with a greater degree of satisfaction, repaired to my own lodging, and, with an eagerness I almost blush to acknowledge, proceeded to unravel the secrets of the manuscript confided to my judgment.

VENERABLE TREES.

SOME time ago appeared an article in the "Horticultural Register," by General Dearborn, on the cultivation of forest trees; it contains some curious statements respecting the ages to which trees sometimes attain. How few and fleeting do our short days appear when we think of these "medals of distant ages!" How fitly, and with what a salutary appeal to the heart, are they planted around a family home, to link one generation of those who dwell there with another, for hundreds and thousands of years! How beautiful, how appropriate, how easily adapted to our wishes, and made to utter their solemn, their soothing, their impressive lessons according to our will, are these materials that God hath provided, wherewith to erect for one's self a "living monument!"

General Dearborn says,—Adanson and De Candolle have ascertained and published accounts of the probable longevity of numerous celebrated trees. Some of the cedars of Mount Lebanon measured in 1660, by Maundrell and Pocock, were found to have been nearly eight hundred years old. The oak of Welbeck-lane, described by Evelyn, must have been fourteen hundred; the linden of Choille, five hundred and thirty-eight; and that of Irons, five hundred and eighty-three. The olive-trees in the garden of Jerusalem certainly existed at the time of the Turkish conquest of that city; and one at Pescia, in Italy, had endured seven centuries. The English yew trees of Fountain Abbey, in the county of York, have survived twelve centuries; those in the churchyard of Crowhurst, in Surrey, fourteen hundred; that of Fotheringall, in Scotland, from twenty-five to twenty-six hundred; that of Braburne, in Kent, three thousand. But those botanists describe two other trees of a most remarkable character; namely, the baoback, estimated to be five thousand one hundred and fifty years old; and the cypress of Taxodium, in Mexico, which is one hundred and seventeen feet and ten inches in circumference, is still more aged.

The ages of the following remarkable trees have been ascertained with as much exactness as historical data, or the principles which have been

derived from the actual admeasurement and counting the circles of trees of like kind afford :—

	Age.
A date-tree in Egypt.....	800 yrs.
Apricot-tree in Damascus	324
Red oak of Mount Etna	400
Walnut-tree of Balbec	406
Almond-tree in Damascus	640
Fig-tree in Damascus.....	648
Olive-tree in Palestine	719
Fig-tree in Palestine	780
Olive-tree of Asia Minor	850
A live oak in Louisiana.....	1000
Sycamore or plane-tree of Palestine	1050
Sycamore of Heliopolis	1805
One of the cedars of Mount Lebanon	1824
Peletin (<i>terebinthus</i>) of Asia Minor	1890
A cedar of Mount Lebanon. ...	2112
The celebrated chestnut of Mt. Etna	2660
Sycamore of the Bosphorus. ...	4020

The sycamore near the ruins of Heliopolis, according to the tradition in Egypt, existed before the visit of Joseph and Mary, and they sat under its shadow, and drank water from its neighbouring well. The accumulation of mud from the deposit of the Nile has long destroyed the original tree, but sprouts having put forth from the original stump, and forming part of a circle, calculations were formed therefrom of the size and age of the original tree, which was added to that of those which now exist.

The sycamore of the Bosphorus, under which it is said Godfrey, of the first crusading army, encamped, has also disappeared, leaving ten trees, which sprung from the stump; one of which, being measured, was found to be one thousand and fifty years old; and it is possible others of equal age have been removed, and that the present trees are the second remove from the parent stock.

The chestnut of Mount Etna grew from the stump of a felled tree.

RATS.

RATS! rats! the subject is a great and vast one, whether we contemplate the fecundity of the genus, the countless thousands that swarm upon the face of the earth, or the undrowned millions that inhabit the waters under the earth—we are lost in positive abstraction; or if we can re-gather our wandering thoughts, they do but present to the visual and conceptive eyes of our understanding a boundless extent of rat-land.

In our vision we see what Shelley saw,—

"As from a tower, the end of all."

That "end" is nothing more nor less than the tip of a rat's tail. Beneath us we see continents, capes, islands, and their shores, all living under the happy sway and the peaceable government of the king of the rats, whose palace is covered by a beautiful enamel of a tortoiseshell colour.

We see, on a nearer inspection, that this is from the covering array of various coloured coats, and skins of thousands of slaughtered tabbies. Alas! a shifting scene of our departed grandmother come to life again—the tea-table, the cat-lap, and the purring puss passes before us; but it is soon gone, and we are ourselves again. The wide earth beneath us is crowded with a happy and rejoicing population of rats,—whiskers, snouts, sharp-pointed eyes, and whisking tails, all in full growth and perfection; neither cat nor Malthus, neither terrier nor Martineau are there. The ponds and the pools swarm with them, the rivers and seas are rife with their numbers. One would suppose that the oriental salutation to princes was instilled, like mother's milk, into their understandings—they

“Live for ever;”

or, in other words, they never die. They are innocent, as unborn babes, of either cholera or influenza, toothach or corns; they know nothing of sickness or ailment, illness or disease; there are no doctors among them;—they seem created but to bring forth, multiply, and replenish the earth,—a line of duty which they strictly abide by, and as regularly perform. Such being the entire truth of the case, it will not appear surprising if we exhibit something like feminine weakness, or nervous apprehension, in approaching a subject of such vast magnitude, extending from the days of Noah even unto our own, and embracing the consideration of a class of creatures covering the whole surface of the earth, and affecting alike the living king upon his throne, and the dead street-sweeper in his grave. We experience much difficulty, however, in knowing precisely at what point to commence our commentaries upon this subject; the candidates among the tribes are so numerous, that we are utterly at a loss. As we write, our ears are assailed by a mighty chorus of rat-revelry, a loud and exulting psœn is ringing around us, like—but the sound of the sea, or the roar of thunder, are as nothing to that which, at this instant, pre-
sages to our listening organs that they are in disgrace, that their occupation is gone; and we prophecy not falsely when we state that the days of our mortal deafness are near at hand. These creatures, as they are omnipotent in numbers, so they are omnipresent in person; in the cathedral and the church, in the chapel and the meeting-house, they are equally “at home.” We have seen them dancing quadrilles and playing at leap-frog along the aisles of Canterbury cathedral; and the last time we were there, a full-grown whisker-andos, with a pair of eyes like poniards, grinned maliciously at us from beneath an old arch in the cloisters; nay, we remember in our youthful days, during the Archbishop's visitation, we saw one bold rat perched on the topmost summit of the archie-

piscopal throne, whilst another dextrous fellow, hardened by age, roguery, and impudence, sniffed his lordship's wig, whilst he was at prayers. This latter trick was more than our youthful sensibilities could stand, and we disturbed the harmony of the minster's music by bursting into a loud and joyous horse laugh; the rattling of our schoolmaster's cane about our ears soon restored our wandering senses to the occupancy of their “local habitation,” and we saw no more rats that day. Bread and water, and solitary confinement, was our “portion” for the seven succeeding suns; and we then promised within ourselves, that if ever time and opportunity offered, we would indite an article on the then operating cause of our punishment. The time has now arrived, the opportunity is this day afforded us, and we appeal to our readers whether we are not now fulfilling our promise to the best of our power, in order that, from our past experience in this matter, may spring up their future improvement and edification.

We have been eye-witnesses to their gambols in church—watching them carefully peep from an old hole in a rotten pew—and gently steal down the aisle, stopping occasionally to play bob-cherry with the tassel of a lady's cloak, or casting furtive and longing glances at the sallow physiognomy of our parish clerk, the *contour* of whose countenance not unaptly resembled a circumferential half-yard of toasted cheese.

Many a Member of the House of Commons has been aroused from his slumbers during a drowsy debate by the wisdom tooth of one of these “interesting creatures,” penetrating through the polish of Day and Martin; the calf-skin, and the stocking, and taking a gentle nibble out of an orator's toe! But, alas! a sad woe and judgment are come upon us—we intended to wind our intricate way through this labyrinthine subject, and had only left our writing-table to take tea with a few friends, whose

“Old familiar faces”

had “dropped in,” to gladden with their joyous sunshine, the dim and murky hours of domestic daylight. We left them over the social beverage, and returned to our studious contemplations, when, to our mortification, we found that one of these very convicted quadrupeds just noticed, who doubtless laboured under a most thievish hunger and thirst, and who moreover felt that we were in the very act of anatomizing all his misdoings and misdeeds—determined, in revenge, to swallow up our ink, and nibble our pen to the very stump; and this he has done most effectually. We must therefore apologize to our readers for this abrupt and sudden “diversion” from our subject; but in a short time we shall have recovered from the shocking state of tremor in which we now are, and shall be in a “more fitting mood” to continue our remarks on this all-important subject of rats.

ERFON.

HOLBEIN'S DANCE OF DEATH.

There are some ideas so natural and inevitable, that one would imagine they were exempt from the law of being at one time forgotten, at another time in vogue. Death is one of these; and yet there are some ages in which death is little thought of,—others where it seems ever present to the public mind. In the middle ages, for example, death was a spectre, reflected and depicted every where,—a spectre that the present age has evidently banished. Why is this? I believe it is to be discovered in the circumstance that we are less religious. In Italy, Dante makes death the subject of an epic poem; and the painters have, in their art, followed the poetic taste thus set them. Oragna and the artists of the Campo Santo have depicted last judgments. Michael Angelo painted on the walls of the Sistine chapel, a most magnificent and beautiful poem on death. To the north of the Alps the same idea has inspired a pictorial illustration more popular, more grotesque and bizarre. There are two "Dances of Death" generally known, one at Dresden, in the cemetery beyond the Elbe, another in the department of Auvergne, in the admirable church of the *Chaise Dieu*. In both of these Death is at the head of a band of men of all ages and conditions; there is the king and the beggar, the old and the young—Death leads them all. Holbein has seized the popular idea as Goëthe did Faust, and illustrated it with all the richness of his genius. His "Dance of Death" was painted in the Dominican cloister of Basle. It has perished, like all frescos; but there remains enough to judge by. It is incredible with what art Holbein gives the expression of life to these hideous skeletons, all of which

seem to think and to breathe, and to be endowed with the gestures and looks of life. I have long thought that this peculiar power was the result of Holbein's rich and vivid imagination; but it was not so. Since visiting the vaults of St. Michelet, at Bourdeaux, famous for the preservation of mortal remains, I became aware that Holbein's power in his "Dance of Death" was owing to having studied and drawn from actual skeletons. At St. Michelet there are mummies and skeletons of all ages, six hundred years old and upwards, placed in niches, upright as it may be, all have a different physiognomy—a peculiar expression. There is life in them—such life, at least, as a painter seeks. I remember one to the right of the door as you enter; he is seated on his thigh bones, like the *beggar in the bowl*, with a laughing and ironic air, and looks as if he were mocking at the living whom curiosity introduces into his gloomy abode. I found this very skeleton *beggar in the bowl* as the same Death of Holbein.

Another remarkable "Dance of Death" is that which is painted inside of the covered bridge of Lucerne, by an unknown artist. He has represented the ordinary scenes of life, and how Death puts an end to them;—a summer-day party, with Death for the coachman;—folk dressing for a ball, while Death enters as a hair-dresser. All these scenes are drawn without art or care; they were popular ideas, destined to amuse the people; they are the caricatures of that day, caricatures that be-mocked the world in general—the general weaknesses and follies of mankind, instead of, as at present, attacking individuals, and leaving the censorship of man to the moralist.

SAYINGS AND DOINGS.

AN IRISH ELECTION TWO HUNDRED YEARS AGO.

—The freeholders assembled in Philipstown to elect knights for the King's County; and some of the Irish having consulted together the same morning, attended the sheriff to the shire-house between eight and nine o'clock, where, the writ being read, Sir Francis Rushe and Sir Adam Loftus were propounded by some of the freeholders, as the fittest men to be elected. But Philip O'Dagan delivered to the sheriff two several lists of names, which he said had been given for Sir John Mac Coughlan and Callagh O'Mulloy, whom they had chosen already, and would have none other; and upon delivering the lists they cried out, "Mac Coughlan and O'Mulloy." The other side, to the number of sixteen, gave their votes publicly for Sir F. Rushe and Sir A. Loftus. The under-sheriff received the papers, and made up the indentures for Mac Coughlan and O'Mulloy, (having the greatest lists of names in the list), which indentures were accepted by the high-sheriff; yet, notwithstanding, he returned Sir A. Loftus and Sir F. Rushe, alleging "that the greatest number of voices given publicly was for them." In this proceeding, on the part of Mac Coughlan and O'Mulloy, we find this misarrange-

—that two gentlemen, whose names were returned in the list, upon the reading, disavowed the same, and subscribed the other part. Some other also confessed he had set his hand to the list after the election was done; and Sir Terence O'Dempsey being absent, gave his voice by proxy to the said Mac Coughlan and O'Mulloy, which O'Mulloy could not speak English; a deficiency not uncommon among the magnates of the land at that time.—*Burke's History of the Commons.*

PORTUGUESE ROBINSON CRUSOE, DIEGO ALVAREZ. —He was wrecked upon the shoals on the north of the bar of Bahia. Part of the crew were lost; others escaped this death to suffer one more dreadful,—the natives seized and ate them. Diego saw there was no other possible chance of saving his life than by making himself as useful as possible to these cannibals; he therefore exerted himself in recovering things from the wreck, and by these exertions succeeded in conciliating their favour. Among other things he was fortunate enough to get on shore some barrels of powder, and a musket, which he put in order at his first leisure, after his masters were returned to their village; and one day, when the opportunity was favourable, brought down a bird before them. The women and children

shouted Caramuru! Caramuru; which signified "a man of fire!" and they cried out that he would destroy them; but he gave the men to understand, whose astonishment had less of fear mingled with it, that he would go with them to war, and kill their enemies. Caramuru was the name which from thenceforward he was known by. They marched against the Tapuyas; the fame of this dreadful engine went before

them, and the Tapuyas fled. From a slave Caramuru became a sovereign. The chiefs of the savages thought themselves happy if he would accept their daughters to be his wives; he fixed his abode upon the spot where Villa Velha was afterwards erected, and soon saw as numerous a progeny as an old patriarch's rising round him. The best families in Bahia trace their origin to him.—*Southey's History of Brazil.*

GEMS.

"DISCOVERIES."—Such is the title of one of the rare pamphlets of Ben Jonson, dated 1651; and which is among "the last drops of the quill." We cull from it some striking and solid observations on men and manners; in the perusal of which the reader will no doubt be tempted to exclaim, "O, rare Ben Jonson!"

"Ill fortune never cursed that man, whom good fortune deceived not. I have therefore counselled my friends, never to trust to the fair side, but so to place all things as she gave them, that she may take them again without trouble.

"A beggar suddenly rich, generally becomes a prodigal; he puts on riot and excess to obscure his former obscurity.

"No man is so foolish but he may give another good counsel sometimes; and no man so wise, but he may easily err, if he takes no other counsel than his own. He that was taught only by himself, had a fool for his master.

"Opinion is a light, vain, crude and imperfect thing, residing in the imagination, but never arriving at the understanding, there to obtain the tincture of truth. We labour with it more than with the truth.

"Many men do not themselves believe what they would fain persuade others; and less do they the things which they would impose on others; but least of all, know they what they most confidently boast.

"What a deal of cold business doth a man mispend the better part of his life! in scattering compliments, tendering visits, gathering and vending news, following feasts and plays, making a little-winter love in a dark corner.

"Wisdom without honesty is mere craft and cozenage. A good life is a main argument.

"I cannot think Nature so spent and decayed as to bring forth nothing worth her former years."

CHARITY.

"Friend, I'm too poor to give," says prudent Tom,

"And charity, you know, begins at home;"

"Ay," quoth the starveling, "Charity, 'tis true, Begins at home, and often ends there too!"

THE TONGUE.—I must confess I am so wonderfully charmed with the music of this little instrument, that I would by no means discourage it. All that I aim at is, to cure it of several disagreeable notes, and in particular of those little jarrings and dissonances which arise from anger, censoriousness, and gossiping. In short, I would always have it tuned by good-nature, truth, discretion, and sincerity.—*Addison.*

A SISTER.—He who has never known a sister's kind ministration, nor felt his heart warming beneath her endearing smile and love beaming eye, has been unfortunate indeed. It is not to be wondered if the fountains of pure feeling flow in his bosom but sluggishly, or if the gentler emotions of his nature be lost in the sterner attribute of manhood.

"That man has grown up among kind and affectionate sisters," I once heard a lady of much observation and experience remark.

"And why do you think so?" said I.

"Because of the rich development of all the tender and more refined feelings of the heart which is so apparent in every action, in every word."

A sister's influence is felt even in manhood's latter years, and the heart of him who has grown cold in its chilling contact with the world, will warm and thrill with a pure enjoyment, as some incident awakens with the soft tones and glad melodies of his sister's voice; and he will turn from purposes which a warped and false philosophy has reasoned into expediency, and even weep for the gentler influence which moved him in his earlier years.

THE UNBELIEVER'S CREED.—I believe that there is no God, but that matter is God, and God is matter; and that it is no matter whether there is any God or not. I believe also that the world was not made; that the world made itself; that it had no beginning; that it will last for ever, world without end. I believe that a man is a beast, that the soul is the body, and the body is the soul, and that after death there is neither body nor soul. I believe there is no religion; that natural religion is the only religion; and that all religion is unnatural. I believe not revelation; I believe in tradition; I believe in the Talmud; I believe in the Alcoran; I believe in Confucius; I believe in Mahomet; I believe not in Christ.

Lastly, I believe in all unbelief.—*Bishop Horne.*

ANGER.—"Let not the sun go down upon your wrath," (Eph. iv. 26,) to carry news to the antipodes of thy revengeful nature. Let us take the apostle's meaning, rather than his words, and with all possible speed depose our passions; not understanding him so literally as that we may "take leave to be angry till sunset;" for then might our wrath lengthen with the days; and men in Greenland, where day lasts above a quarter of a year, have plentiful scope for revenge.—*Dr. T. Fuller.*

INFIDELITY IN FRANCE.—The spirit of infidelity pervades and impregnates almost the whole mass of that portion of society which is most distinguished by intellectual and physical energy, and which consequently exerts the most commanding influence in the regulation and propulsion of the whole machinery of public and private life. It tinctures the national sciences; it accompanies the march of discovery; it deposits its countless spawn in the shallows of light literature; it is the very life and essence of all the most popular and distinguished productions of the stage; it passes from the arena of public commerce into the circles of social intercourse, and, like a volatile, though often latent poison, insinuates itself into every vein of the body politic.—*Davies.*

IGNORANCE AND FORGETFULNESS.—To be ignorant of evils to come, and forgetful of evils past, is a merciful provision in nature, whereby we digest the mixture of our few and evil days; and our delivered senses not relapsing into cutting remembrances, our sorrows are not kept raw by the edge of repetitions.—*Sir Thomas Browne.*

THE BIBLE.

Nor long ago a proposition was made to prepare a book of *asbestos*, whose pages should record the annals of the world; and as the material is incombustible, and would survive the fires of the last day, the volume was to be called "The Book of Eternity." Vain aspiration! the true book of eternity is already extant—the Bible; and with this vast superiority over the human invention, that it is mysteriously related to a twofold eternity: it is the gift of the past eternity to time, and will finally be restored by time to the eternity which is yet to come. It is a leaf from the book of the divine decrees; it reveals thoughts which were revolved from everlasting in the mind of God; in its march through time it scatters those thoughts like seeds, whose fruit is to be gathered in eternity. It is the voice of one eternity speaking to another, for the benefit of every listening child of time and heir of immortality. It has never been out of the hand of the Eternal; though he graciously presents it to us as an open book, and turns it over, page by page, to the willing eye, yet it will hereafter appear, that he has never allowed it to pass out of his keeping, but has always held it in the hollow of his hand. This alone will account for its preservation.

So copiously did the Fathers quote from the New Testament, especially from the gospels, that had that portion of Scripture been destroyed, their writings, it is said, would have supplied and restored the whole again. That destruction will eventually take place; but when the final conflagration shall have reduced the material of the Bible to ashes, the indestructible truths will be found transcribed by the finger of the Spirit, and enshrined in the hearts of the renewed. The disembodied spirit of truth will appear before the throne of God, and beholding in every face the reflection of her own image, will justly claim them all for her offspring.

There are certain places on the face of the globe which mankind seem, by general consent, to have selected for the theatres of great events. Such, for instance, is the Plain of Esdrelom, the battle-field of empires, where every nation of the old world has seen its banners wet with the dew of Hermon. And such the Mediterranean, the *namachia* of the nations, where empire has often been lost and won. But the Bible is the arena of more and higher conflicts still; It is at once the object of contest, the armoury which supplies the weapons, and the chosen ground of struggle. Why has it witnessed more frequent and fierce encounters than any other object on the face of the earth? Ask why is the rock of Gibraltar an object of fierce contention in every war with the power that holds it. Why is the pass of Thermopylæ steeped to the centre with blood? The Bible is the frontier fortress of the church; all

the armies of error, in every age, have beleaguered it; but the sons of truth, who hold it for God, have received it with this address, "Here stand, and the gates of hell shall not prevail against you;" and they "loved not their lives unto the death."

The Bible is the true prophet of hope. The books of pagan antiquity sung only of the golden-aged past; for the future, their moral was despair. Like the stern-lights of a ship, the radiance they threw fell only on the track behind. The Bible builds on the future; the chorus of all its songs is of a glory to come. In the mid-winter of humanity it has gone on sowing light for the righteous—seeds of the sun. And in the captivity of the church, when the daughter of Sion sat disconsolate in her chains, the voice of the Bible has ever been, "Arise, and shine." No dell of Tempe, no garden of the Hesperides, no vale of Cashmere, no slope on the banks of Genesareth, where the seasons met and danced together, ever dazzled with more golden fruit, or charmed with fairer verdure and richer fragrance, than the Bible presents in the moral landscape of the future.

"O scenes surpassing fable, and yet true!
Scenes of accomplished bliss! which who can see,
Though but in distant prospect, and not feel
His soul refreshed with foretaste of the joy?
Rivers of gladness water all the earth,
And clothe all climes with beauty. • • •
The various seasons woven into one,
And that one season an eternal spring."

To the Bible, the great philosophers, legislators, and founders of ancient sects were indebted, directly or indirectly, for nearly every thing excellent in their codes and systems.

"Hither, as to their fountain, other stars
Repairing, in their golden urns drew light."

A live coal from off its altar, quickly transmitted, —like the torch passed from hand to hand in the lamp-game of the Grecian youth—kindled the light of Persia, Greece, and Rome. Hence, doubtless, Plato drew the dim conception which he is supposed to have entertained, of the necessity of a divine Mediator; whether from an indistinct echo of the patriarchal faith, or from rays refracted from the Hebrew prophets, through a Phœnician medium, it is not easy to determine. Probably both co-operated, with his own deep sense of necessity, in partially unveiling the awful truth to this divine philosopher, this "plant from the wreck of Paradise, thrown on the shores of idolatrous Greece."

The Bible is distinguished from every other book professedly inspired—from the Shasters of the Brahmin and the Koran of Mahomet—by its earnest commendations of knowledge. Imposture fears the light; the Bible courts and creates

it. Not only does it extol knowledge as a glory, it excites a thirst for it, and commands us to seek after it as a most sacred duty.

And, O, what a field for contemplation does it lay open! It is the history of a world, of our own world—its morning, its meridian, its many changes, its prospective close. The countless multitudes of antiquity pass before our eyes, the heroes, and tyrants, and martyrs of old time, their enormous wealth, their glittering palaces, and mighty cities. We hear the tumult of their armies, and the fame of their kings proclaimed,—Assyrian and Persian, Babylonian, Egyptian, and Mede; and all is suddenly swept away. Another king or conqueror comes, and another army, more numerous than the last, and that, too, perishes before our eyes; and another after rises up, and then another. And all these men were our fathers, whose virtues and vices are recorded in blazing letters, and whose punishment or reward is made known to the uttermost regions of the earth, for the benefit and guidance of us their sons. Were it but the ruin of a history it would be venerable; were it a fiction only it would be a grand one; but it is complete and true, it is full of general as well as individual interest, it is replete with simple and manly narration, with passionate appeals, and overwhelming eloquence. It is addressed to ourselves, it is connected with us and our well-being; it gives us a story of the past, and a lesson for the future. There is nothing in Homer which can mate with the soaring spirit of its poetry; there is nothing in Virgil which can equal the gentle pathos of its strains; Dante is less awful, and Ariosto less wild; even Milton, who has topped the sublimity of all other writers, and Shakspeare, who has surpassed the united world in prodigality of imagery and variety of thought, must yield to the infinite grandeur and beauty which are impressed on the living oracles, or scattered in exuberance over every page.

I have said the Bible is the history of our world; but this is not saying enough, its subject is the fate of worlds, the revolutions of heaven and of earth—destruction and restoration on the vastest scale. It is more than the history of all this, it is the philosophy of the history; and, more than this, the theology of the philosophy. But in the remarks I have made, I have only ascended the steps of the temple, the hallowed interior is yet to be viewed. For the present, it only remains for us to admire the manner in which the Bible embodies its great doctrines, and inculcates its great lessons. It narrates interest-

ing facts, and teaches by example. And here shall avail myself of a paragraph in Mr. Binney's "Discourses on the Practical Power of Faith:" "We are more likely to be successful in our inculcation of duty, if we not only state what it is right to do, but actually show how it has been done. The mind, in such cases, seems to have the advantage of another sense—it not only hears, but it sees; the understanding is not only put in possession of truth, but the fancy is furnished with illustrations and images. Many a man who could not comprehend the arguments for a particular Providence, can feel the proof as seen in the lives of Abraham or Joseph. He whose weakness would be overcome by temptation or calamity, could he remember nothing but the abstract precepts of the preacher, may be stimulated to exert both firmness and faith, by knowing that others have been equally tempted, without sacrificing their virtue, and equally afflicted, without losing their confidence. For this very purpose, we imagine, has the Holy Spirit included so much of an historical nature in the inspired volume. On the same account, our divine Lord conveyed most of his instructions in parables, embodying, in the intelligible actions of men, the particular truth he intended to enforce. This was emphatically 'teaching the multitude.' The mass of mankind feel, rather than reason; they arrive at truth by sensation, rather than by argument; the voice of nature from within, responds to the voice of nature from without. They cannot go along with you, perhaps, in your demonstration of a principle; but they can comprehend the principle itself. They can learn nothing from a laboured disquisition on the beauty of virtue; but they can both see its beauty and feel its attractions, if presented before them in action and character. Now, by becoming familiar with the history of holy men, you will become familiar with the principles of religion itself; for it is these, in fact, you are required to contemplate, embodied in obvious and striking illustrations." On this account I am pleased to notice a book called, "Interesting Narratives from the Sacred Volume, Illustrated and Improved," by the Rev. J. Belcher, a volume of which I have only left myself room to say, that it is calculated to interest and instruct the young, to invigorate the best principles of the Christian, and to aid the Christian minister in his preparation for the pulpit, by giving him a connected bird's-eye view of the many Scripture narratives of which it treats.

MEDICAL STATISTICS.

THE estimated proportion of deaths in this country, for the last half century, indicates a continually diminishing mortality, which can only be ascribed to some steadily operative cause.

Thus, in 1786, the rate of mortality, for the whole of England and Wales, was 1 in 42; in 1801, 1 in 47; in 1831, it had diminished to 1 in 58,—showing an improvement of 38 per cent.

in the short space of half a century. The annual mortality of the county of Middlesex, which in the beginning of the last century was estimated at 1 in 25, had fallen to 1 in 35 in 1801; and at present does not exceed 1 in 45. A corresponding improvement is visible in our urban population. In London, for example, the number of deaths diminished, from 21,000 in 1697, to 17,000 in 1797; showing not only a comparative but an absolute decrease of mortality, in regard to the preceding century. The same fact is also observable in regard to the present century; the number of deaths being less numerous, by 3000, in 1826, than they were in 1766, although the population had very nearly doubled itself during that period. From 1720 to 1750, the mortality of London was estimated at 1 in 20; at present, it has decreased to 1 in 46, a rate much more favourable than that for the whole of France, and materially less than the known rate of mortality for any other city in Europe. Manchester has more than quadrupled its inhabitants since the middle of the last century; but, notwithstanding this, the mortality has declined, from 1 in 25, to 1 in 50, or exactly one half.

This improvement is more or less conspicuous in most of the European states or cities, but in a far inferior degree to what appears in Great Britain; for, notwithstanding that it has long been the fashion to exhaust every term of reproach on our variable climate, and particularly on the fogs and smoke of London, it would yet appear, that the most favoured spots on the continent are not comparable to either in regard to salubrity;—nay, the very places which have long been selected as the resort of invalids, and celebrated as the fountains of health, are, in fact, far more fatal to life than our great metropolis. The following table conveys a pregnant hint to those who consider a foreign climate preferable to our own for the restoration of health.

MORTALITY OF COUNTRIES.

Russia	1 in 26

London	1 in 46
Manchester	1 in 50

"It is indisputable," Dr. Hawkins observes, "that the average proportion of deaths in England, and her cities, is less than that of any other city in Europe: and it may be added, that the powers of body and mind are preserved, to a late period, in higher perfection here, than in other countries. Nowhere are the advances of age so slowly perceived, and nowhere so little manifested on the exterior."* It may be added, that the mortality of the continental cities would be greatly augmented but for their public hospitals. Dupin estimated that half the population of Paris died in the public hospitals, and other asylums of charity.

To what, then, are we to attribute this increase in the value of human life on the one hand, and these varying rates of mortality on the other? There can be no doubt that it depends on a concurrence of causes which more or less directly emanate from increased wealth and civilization. These may fairly enough be divided into general and medical.

Among the general causes, the amelioration of climate, by cultivation and surface drainage, must hold a principal rank. These tend to banish two of the most formidable enemies to health and longevity, viz., cold and moisture. These causes operate principally on the young, particularly those in a state of infancy, and derive much of their force from being united with poverty. Now, it is precisely among this section of the population that the decline of mortality has been principally exhibited. Within the last half century, the mortality of those under twenty years of age has diminished, from 1 in 76½, to 1 in 137, or nearly one half, this calculation being made in reference to the whole population. In some of the public schools, a very low rate of mortality exists, which may partly be attributed to a plenty of good clothing and food, and partly to the fact, that parents will only send those children that happen to be strong. At the Edinburgh High School, for example, the annual mortality has not exceeded 1 in 833, which is considerably less than the annual minimum mortality, (51 per cent.,) from ten to fifteen years of age, for the whole of England and Wales. In reference to the small number of deaths which have occurred at Christ's Hospital, from 1829 to 1833, viz., 1 in 157½, Dr. Mitchell, in the "Factory Report," justly observes, that it is to "substantial clothing, and an abundance of wholesome food, healthful

* "Elements of Medical Statistics," 8vo. Lond. 1829; a work of singular merit, and doing equal credit to the head and heart of the amiable author.

exercise in the hours allowed for recreation, and immediate attention to the first appearance of sickness, under skilful medical men," that we must attribute this result.

Another very influential cause of improved health, arises from increased commercial and agricultural prosperity, which must not only multiply the comforts of the poorer classes, in the three essential articles of food, clothing, and habitation, but by exhilarating the mind with cheerfulness and hope, call its best energies into wholesome operation. The influence of depraved or defective food, in checking the increase of population, and swelling the bills of mortality, was rendered but too manifest by the bad crops of 1795 and 1800; while the effects of despondency on the body, or of the *morale* on the *physique*, scarcely require any formal proof. Surgeons have long been aware of the hazard of performing any capital surgical operations on patients labouring under mental depression; and it has been observed, that the greatest difference exists in the consequence of disease, as it happens to affect a retreating or an advancing army; the constitution, which in the one case triumphs over incredible difficulties, succumbing in the other, without a struggle, under the merest trifles. It may be observed, too, that epidemics are in general the offspring of misery and want, and exhaust their principal fury on the lower classes.

On the contrary, the conservative tendency of an easy and affluent condition is remarkably exemplified in the low rate of mortality among those who have insured at the Equitable Office. From the year 1800 to 1821, it did not exceed 1 in 81. At the University Club, for a space of three years, it did not exceed 1 in 90. Now, if this be contrasted with the mortality among the West India slaves, we shall obtain some idea of the immense protection which wealth brings with it to the body. The mortality among these was formerly as great as 1 in 6: in 1829 it had diminished to 1 in 16, and of the free Africans to 1 in 33. The lower rate of mortality among the free Africans, shows that it did not depend on climate, transplantation, or any other general cause operating alike upon the whole race. The children of the poor in France die in the proportion of at least two to one of those in affluent circumstances; and the same difference is observable between the abject and the opulent; among the adult population, occupying the extreme localities of Paris. In a recent number of the *Annales d'Hygiène Publique*, tom. xiv. p. 88, M. Lombard has given an analysis of 8,488 men of sixteen years of age and upwards, inscribed in the mortuary registers of Geneva from 1796 to 1830, from which it appears that these persons attained a mean life of fifty-five years, while the two extremes of the scale were as far apart as 69.1 on the one hand, and 44.3 on the other. Magistrates, *rentiers*, and Protestant ecclesiastics,

attained the mean life respectively of 69.1, 65.8, 63.8 years; but enamellers, locksmiths, and painters, only 48.7, 47.2 and 44.3 years; the number for agriculturists (44.7) representing very nearly the mean term. M. Lombard, in short, comes to the conclusion that a state of competence, as opposed to that of distress, is calculated to prolong life at least seven years and a half; and an active life, as opposed to a sedentary, as much as one year and four-tenths; making together a difference of nearly nine years in the life of such persons. One fearful cause of mortality in this country is scrofula, in its hundred different forms; but nothing excites this disease so certainly as cold and squalid poverty, combined with insufficient nutriment and clothing. From rickets alone, (which is a species of scrofula,) the annual number of deaths within the Bills of Mortality seldom averaged less than 380 up to the beginning of the 17th century. Towards the middle of this century, however, they had diminished to 11, and towards the end of it to 1.

There are a number of other circumstances, connected with our economic relations, which materially contribute to promote the public health: and so far to confirm the remark of the discerning Sydenham, that "*Morbi acuti Deum habent autorem, chronici ipsos nos*:" as, for example, an abundant supply of wholesome water, an efficient system of drainage, a general taste for cleanliness, enforced, where it becomes necessary, by wholesome municipal authority, the less crowded state of our private dwellings, the better economy of our hospitals, a more commodious system of public building, combining the advantages of space and ventilation with internal conveniences, a plenty of good wheaten bread, and the use of frequent changes of linen next the skin, in the room of sordid and filthy woollen. Mr. White, in reference to the extinction of leprosy, and, indeed, of most of those other frightful epidemics, which have at one time or another desolated this country, very ably sums up the causes of this happy change. "This," he says, "may have originated, and been continued, from the much smaller quantity of salted meat and fish now eaten in these kingdoms—from the use of linen next the skin—from the plenty of better bread—and from the profusion of fruits, roots, legumes and greens, so common in every family. Three or four centuries ago, before there were any enclosures, sown-grasses, field-turnips, field-carrots, or hay, all the cattle that had grown fat in summer, and were not killed for winter use, were turned out soon after Michaelmas, to shift as they could through the dead months; so that *no fresh meat could be had in the winter or spring*."—*Nat. Hist. of Selborne*.

The precise change of habits, referred to in the above extract, does not of course apply to the improved and still improving condition of the lower orders, during the present century. It is,

however, to the same *class* of agencies, which formerly produced epidemical and malignant disorders,* that we must still refer the superior mortality of one town over another, or of one period of time above another. We shall conclude this branch of the subject with one farther extract from Dr. Hawkins :—

“ So intimate a connexion subsists between political changes and the public health, that wherever feudal distinctions have been abolished, wherever the artisan or the peasant has been released from arbitrary enactments, there also the life of these classes has acquired a new vigour ; and it is certain, that even bodily strength, and the power of enduring hardships, are divided among the natives of the earth in a proportion relative to their prosperity and civilization.”

The gradual substitution of spirit for a wholesome malt liquor, and the rapid multiplication of gin palaces, must have acted as a serious counteracting circumstance to the beneficial tendencies before mentioned : so must also the progressive change which has taken place in the relative proportions of the agricultural and manufacturing population. In 1811, these proportions were as 100 to 126, for the whole of Great Britain : in 1831 they had become as 100 to 149, or, taking the increase in the whole number of families, for these twenty years, to have been at the rate of 34 per cent, the accession to the agricultural class has only been $7\frac{1}{2}$ per cent, while that to the manufacturing and trading classes has been at least 27 per cent. For the same reason, a disposition among the class of *rentiers*, or independent gentry, to centralize, or adopt a civic mode of life, in preference to the country, must have had a proportionably adverse effect on the general health.

* It is highly probable, that the same causes, acting under different circumstances of the atmosphere, produced the different epidemics of the middle centuries. The plague was the emphatic evil of those ages, and scarcely any ten years elapsed without a considerable variation of it ; but the devastation committed, in the intervals, by dysentery, scurvy, putrid fever, and a number of other infections, was scarcely less deplorable. Of these, the sweating sickness was most nearly allied to plague, and prevailed to a dreadful extent in the years 1485, 1506, 1517, 1518, and 1551. The greatest plague years of the 17th century, were 1603, 1625, 1636, and 1665, in which the mortality is reported to have been respectively 36,000, 35,000, 10,000, and 68,000, although, according to Lord Clarendon, “ many, who could compute very well, concluded there were in truth double that who died.” The memorable fire of London occurred in 1666, while the plague was yet raging ; and, as it has never returned since, it is reasonable to suppose, that the causes of its first appearance were entirely of a local nature. Among the signs which usually ushered it in, Diemerbroeck enumerates “ *Mortis epidemici mali moris, dysenteria valde maligna et contagiosa, et imprimis febres putridas malignissimas et purpurales, plurimique letales.*” Morton, also, in speaking of the poison of the remittent fever, which prevailed for some years previous to 1665, says, “ *Venenum sese recolligens, et mirum in modum auctum, hanc $\sigma\upsilon\nu\epsilon\chi\eta$ in pestem funestissimam et dirissimam incipit mutare.*”

The writer in “ The Dublin Review,” from which we have extracted this paper, goes on very ably to show, that the diminished and still diminishing mortality of modern times arises, farther from the improved state of the medical art, which he illustrates by some very forcible statements, in connexion with the treatment of fever, the practice of vaccination, the decrease of lunacy, the improved practice of midwifery, and the treatment of children ; he closes in the following manner :—

One of the most remarkable effects, arising out of the increased duration of human life, is the increase of the population. At the commencement of the 17th century, the population of England and Wales amounted to 5,134,516 ; in 1831, it rose to 14,174,204, or nearly treble ; and it is observable, that the successive increments by which this was effected, did not occur in an arithmetical ratio, but in proportion as the causes, arising out of increased wealth and civilization, came into operation. Thus the increment for the first half of the last century was 905,368, or $17\frac{1}{2}$ per cent ; but for the second half, it amounted to 2,147,492, or upwards of 52 per cent. Political economists, at one time, endeavoured to resolve this into the increased number of births and marriages, which took place under such circumstances, or to the increased fecundity of marriage, although nothing can be more opposed to the fact ; for in the early part of the last century, the number of marriages for England and Wales was 1 in 115 ; but, in 1821, it had diminished to 1 in 131 ; and in the same manner, the proportion of births, which in 1801, was 1 in 34.8 of the whole population, had diminished to 1 in 38.58 in 1821. Nothing, indeed, is now better established, than that the number of births, relatively to the whole population, diminishes as civilization advances, not because an increasing prudence on the part of the people operates as a “ preventive check,” deterring people from entering into the bonds of matrimony, but because there is in the world a larger proportionate number of persons to whom the engagements of matrimony have ceased to offer any charms. It is probable that, if the estimate were made in reference to that part of the population only, which is still in the vigour of life, the number of marriages would not be found to have diminished ; and this is rendered still more probable from the state of the burials ; for from 1751 to 1761 the total number of burials, within the bills of mortality, was 205,279 ; of which, 106,264, or $51\frac{1}{2}$ per cent., were of persons under twenty years of age ; but from 1831 to 1834, the number of burials was 80,524, of which 34,109, or only $42\frac{1}{2}$, were of persons under twenty years of age. It appears, therefore, beyond doubt, that the extension of human life is one of the chief causes of the increase of population.

SITTINGS FOR MY PORTRAIT.

THIRD SITTING.

SOME conversation arose this morning between my painter and myself on the permanence of pictures. I inquired if the comparative duration of colours was to be attributed to the colours themselves, to the circumstances attendant on the preservation of the specimens, or to any thing in the practice of the art which might seem peculiar to individual practitioners. I had of course observed, what every one has noticed, that some pictures, come to us as if fresh from the hand of the ancient master, others show the perishing hand of time over the whole surface, so that the whole of the primary impression is well nigh obliterated; while others, again, exhibit the influence of decay only in detached portions of the canvass. "I suppose," said I, "you, like Apeller, paint for eternity."

"No, sir, that belongs to your profession: that is the moral painting of the pulpit."

"Doubtless—and it is an important and impressive thought: but alas, how little are our delineations regarded. Yet it may be hoped, and is in fact happily ascertained, that we do not labour in vain: for many see clearly, and feel effectually, the truth of our portraitures."

"O, sir, after all we deal in shadows; you in substance."

"True; and if we pursue the noblest end, doubtless the *highest art* consists in the right manner of depicting the realities of moral and religious wisdom."

A pause of some length ensued, while the pencil gave its magic touches.

"Well, sir, your question remains unanswered. All the causes of decay in pictures, to which you have referred, may have been in operation, and probably more. The works of some painters are remarkable for the brilliancy and perpetuity of their pictures, as are those of others for their fading character. The productions of Gaspar Poussin, for instance, are generally observed to perish in particular parts.

"And how do you account for this?"

"It might be in the canvass, in the colours, or in the carelessness of the painter, that is, in the manner of laying them on. In fact, I think Poussin sacrificed the future to present effect."

Surely, thought I, my friend has suggested a good subject of reflection here: let me try it. *Present and future* are words which express very important ideas; and to sacrifice the latter to the former is obviously common, and equally absurd. In point of fact, however, is it not the general error of mankind? Do not millions sacrifice the future in various ways to the present, or to a present effect? But let me examine into the subject with a little of detail, and in its moral bearing.

This obliquity of mind is not unfrequently discernible in *statesmen and politicians*. Persons of

this class are undoubtedly beset with some of the most powerful temptations that can assault our nature, while more remote than innumerable others of their fellow-men from the sphere of religious influence. Neither *whig* nor *tory* is at present in my view; but *man*, as elevated to particular offices of state, or attached in different grades of society to natural parties. I might even ascend higher, and bring into the field of contemplation the rulers of the world. Before the principles of civil and religious liberty were understood, before the rights of the individual, the true basis of all society, and the necessity of wholesome laws were comprehended, tyranny misgoverned the earth; and wherever they are not even now regarded, there is the element of despotism, and the germ of a selfish and self-destructive power. The purpose of present aggrandizement, and of present influence annihilates what is noble, and renders the mind insensible at once to all that is honourable in a permanent fame, and all that is beneficial to others in present conduct. Upon this ground the Neros, Caligulas, Charles the Ninths, and Henry the Eighths, will ever appear in prominent contrast on the page of history with the Alfreds of our race. Statesmen have too often caught the spirit of their master, and, acting with a deep and dire intrigue to secure personal and temporal glory, have sacrificed the interests of their country and their age. Policy has usurped the seat of patriotism, and he who was chosen to be the conservator has become the destroyer of national pre-eminence. If statesmen for themselves, and party politicians urging them to deeds of violence against the public weal, or sustaining them in acts of notorious aggression upon other nations or their own, promote their ill-earned and ill-fated popularity; if by artifice they creep into power, and by rigid exactions on the one hand, or a temporizing servility on the other, maintain it, then, surely, like the self-exalting painter, they sacrifice the future to present effect.

A similar spirit is traceable in the *gay*, and those who are emphatically, but somewhat invidiously termed, "the higher classes." It cannot however by any means be regarded as their exclusive fault of character; for the same conduct is pursued by others in the infinitely diversified pursuits of self indulgence. Health, happiness, and even life itself, are frequently given in purchase for the pleasure, ay, and the very frivolities of the passing hour. It will be perceived that the word *pleasure* is used in contradistinction to happiness: and they are plainly different, and even opposed, not only in theory but in truth. The one is but the delirium or the dream of existence, the other is the possessed reality of waking life; the one is animal, the other intellectual and moral; the one ephemeral, the other immortal. I

knew an instance, and it was one among a thousand of a young person whose education, so far as fashionable accomplishments are concerned, was considered to be complete, and at the outset of her anticipated seventy years of brilliancy and power, she was introduced into a circle where she had every means of securing a flattering and much-envied reception. Parties, late hours, dress and the dance were the demons that lurked around and laughed at her destiny. She was formed to shine. What signified the future. It must be sacrificed.

"Life let us cherish, while yet the taper glows,"

was the song and the sentiment. It was cherished; it was all: the present hour was the whole eternity of her desire; the present company the whole universe of her thought; the ball room the whole world of her action and empire. She danced, took cold, and died!

What then shall be said of *parents* who inconsiderately indulge, and more inconsiderately still, eulogize and puff off their children? They are petted almost as much as the lap-dog, and are the very paragons of excellence. They are to eat, and drink, and play—and learn, *if they can*; if not the governess must not overwork them; and she, O dire temptation to wrong! must relax what is essential to knowledge, and pour into deceived but delighted ears the praises of what is valueless in execution or attainment. Johnny is idle because he has the headach, or has the headach because he is idle; well, in the one case he is to be pitied, in the other he ought to be flogged; or rather, for I am no ardent advocate for flagellation, he ought to be reprov'd and set to work. He is well enough, however, to play about, and come in after dinner to be caressed, and drink wine, and eat apples. He grows up to be—what? Nothing—or a disgrace! But he and his brothers advance in years, and go to school, and even to college. In all the holidays they are to be indulged to the last degree in little feasts and great feasts. But what is more, they are to be ruined with praise. "Well brother, what do you think of that drawing?" "'Pon my word it is beautiful; why my nephew is a fine fellow." The little fellow swallows the compliment, and conceals the fact how much the master has touched up this fine exhibition of juvenile precocity in art. "Oh, but you must hear Maria play. Come, dear, get your music book." All applaud—There is little tune and less time; it matters not, *mamas*, grandmamas, aunts, uncles, friends are, of course, all pleased. But, "Sister, you must hear William *speach*, he was the first in the school: dubbed an orator, and really I don't know how he got it—but you shall hear. William, come, speak your piece." It is done: he is applauded and — perhaps, ruined! Praise and flattery are the aliments on which he seeks to live; self-sufficient and self-indulgent, he becomes vain, thoughtless, ostentatious, and ambitious; but the catalogue

of evils need not be enumerated. Is not this notoriously to sacrifice the future to present effect?

Surely the day in which we live displays much of the folly of compromise with injudicious parents, and of faulty conception in the *instructors of children and young persons*. Arithmetic, writing, drawing, music, grammar, and the use of the globes. —but I will not enumerate subjects taught. I will suppose the general instruction to be complete, and I care not if it be supposed to comprehend the whole circle of the sciences. I ask, is the *mind* educated? Are youth instructed to *think*: that is, to digest as well as acquire knowledge. They can perhaps read Virgil or Cicero, Livy or Tacitus; they may have been well disciplined in the language, and conducted through some of the writings of Xenophon, or of the Greek poets, and can repeat passages of Æschylus, Sophocles, or Pindar; but have they learned to read human nature, to read and to study the character of men, their own character, the spirituals of moral truth, the right use and application of reason, the true end of life, and the book of revelation? Have they been disciplined to just sentiments, trained to proper pursuits, prewarned and forearmed against temptation, truly prepared for this world and another, and shown how to use success, and how to sustain adversity? What is education?—But I pass on.

What sacrifice to the present is visible in the formation of *matrimonial alliances*? There are, it is said, comparatively few happy matches; but the reason of this may be discovered in the insufficient basis on which they commonly rest. The wise purpose of Providence is continually countervailed by the folly of mankind, who by beginning in passion without principle end in disappointment and misery. There are either no calculations of the future, or they are altogether wrong: there is a gross error committed in the arithmetic of moral science. Without even advertent to the scriptural doctrine respecting being "unequally yoked together," it is obvious that the present engrosses the entire object of pursuit, or the future only as subsidiary to the present. Personal attractions, possessions or alliances, usually comprehend the scheme of anticipated bliss; while the superior qualities of mind are overlooked. The pleasing is sought with supreme and exclusive eagerness. The taste is to be gratified, friends are to be studied, connexions are to be secured; but how life is to be improved, faculties of usefulness are to be cultivated, a profitable companionship is to be obtained, an association that shall have its important bearings upon the real welfare of the future, of another generation, and an everlasting being is to be secured, enters not into the trifler's ideas.

In turning my thoughts to the *preacher* and the pulpit, to exemplify the general position, I would have realized the awful results of the trim-

ming and compromising style of fashionable address—the seeking to please, the aim at display, and the ruinous concealments or perversions of the gospel to suit a vulgar or conciliate a refined or wealthy and influential hearer, which naturally might have claimed a place in these delineations, but the vivid and graphic poetry of Cowper superseded other thoughts, and will doubtless in the reader's estimate most properly close these lucubrations.

"I venerate the man, whose heart is warm,
Whose hands are pure, whose doctrine and whose life
Coincident, exhibit lucid proof
That he is honest in the sacred cause.
To such I render more than mere respect,

Whose actions say that they respect themselves.
But loose in morals, and in manners vain,
In conversation frivolous, in dress
Extreme, at once rapacious and profuse;
Frequent in park with lady at his side,
Ambling and prattling scandal as he goes;
But rare at home, and never at his books,
Or with his pen, save when he scrawls a card;
Constant at routs, familiar with a round
Of ladyships, a stranger to the poor;
Ambitious of preferment for its gold,
And well prepared, by ignorance and sloth,
By infidelity and love of world,
To make God's work a sinecure; a slave
To his own pleasures and his patron's pride;
From such apostles, O ye mitred heads,
Preserve the church! and lay not careless hands
On skulls that cannot teach, and will not learn." Y.

HAIR-BREADTH ESCAPES.—No. I.

BRUCE IN ABYSSINIA.

ON the 8th, in the evening, a little before six o'clock, when I was making ready to go to the Shekh, a message came that he was busy and could not see me; with which, for a time, I was very well pleased. About ten arrived a naked, very ill-looking fellow, more like an executioner than any other sort of man, with a large broadsword in his hand, and seemingly very drunk. He said he was one of the Shekhs of Jehaina, and in a little time became extremely insolent. He first demanded coffee, which was given him; then a new coat, then some civet, and, last of all, drawing his sword, that we should instantly provide him with a new scabbard, his own being but a piece of common leather, which he threw with a kind of indignation down upon the floor. Till that time I had been writing these very memoirs, at least the journal of the day. I was not any way afraid of one drunkard, but laid down my pen, wondering where this insolence was to end. Before I had time to speak a word, I heard my old Turk, the sheriffe Hagi Ismael, say, "You are of the Jehaina, are you? then I am of the Daveina;" and with that he caught the stranger by the throat, taking his sword from him, which he threw out of the house, after casting the owner violently upon the floor. The fellow crept out upon all-four, and as soon as he had picked up his sword, attempted again to enter the house, which Soliman perceiving, snatched his own short crooked sword from a pin where it hung, and ran readily to meet him, and would very speedily have made an end of him, had I not cried out, "For God's sake, Soliman, don't hurt him; remember where you are." Indeed there was little reason for the caution, for when the Arab observed a drawn sword in the Turk's hand, he presently ran away towards the town, crying "Ullah! Ullah! Ullah!" which was "God! God! God!" an exclamation of terror, and we saw no more of him; whilst instead of a new scabbard, he left his old one in

the house. Seeing at once the cowardice and malice of our enemies, we were now apprehensive of fire, things were come to such an extremity; and as our house was composed of nothing but dry canes, it seemed the only obvious way of destroying us.

On the 9th, in the morning, I sent Soliman with the scabbard to Fidele, and a grievous complaint against the supposed Shekh of Jehaina for his insolence the night before. Shekh Fidele pretended to be utterly ignorant of the whole, made light of what had passed, and said the fellow was a fool. But a violent altercation took place between him and my servant, black Soliman, who then told him all his mind, threatening him with Yasine's immediate vengeance, and assuring him he was, before this, fully informed of his behaviour. They however both cooled before parting; Fidele only recommended to Soliman to persuade me to give him two thousand piastres, without which he swore I should never go alive out of Atbara. Soliman, on the other hand, declared that I was a man that set no value on money, and therefore carried it not about with me, otherwise I should not refuse what he desired; but warned him to think well before he uttered such expressions as he now had done.

In the course of conversation, as Soliman told me, the Shekh gave him several hints, that if he would agree with him and help to rob and murder me, he should share the booty with him, and it would never be known. But Soliman pretended not to understand this, always assuring him that I was not the man he took me for, and that, except the king's present, all I had was brass, iron, and glass bottles, of no value to any but myself, who only knew how to use them. They then finished their discourse; and he desired Soliman to tell me that he expected me at the usual hour of six o'clock to-morrow evening, which was Friday, the 10th.

This seemed to me an extraordinary appoint-

ment, because Friday is their festival, when they eat and drink heartily; nor did I ever remember any of them to take medicine upon that day. But with Fidele all was festival, not even their annual solemn feast of Ramadan did he ever keep, but was universally known to be an unbeliever, even in what was called his own religion. I had still this farther objection to wait upon him at night,—that he had gone so far as to solicit Soliman to assist him in murdering me. But I considered at last, that we could not escape from his hands, and that the only way to avoid the danger was to brave it. Providence, indeed, seemed all along to have reserved our deliverance for our own exertions, under its direction, as all the ways we had taken to get relief from others had hitherto, in appearance at least, miscarried. However, it was resolved to go armed, for fear of the worst; but to conceal our weapons, so as to give no umbrage. I had a small Brescian blunderbuss, about twenty-two inches in the barrel, which had a joint in the stock, so that it folded double. It hung by an iron hook to a thin belt under my left arm, close to my side, quite unperceived, like a cutlass. I likewise took a pair of pistols in my girdle, and my knife as usual. All these were perfectly covered by my burnoose; so that with a little attention, when I sat down, it was impossible to discover my having any weapons about me. Hagi Ismael the Turk, Soliman my servant, and two other Moorish servants, took also their fire arms, small and great, and swords, along with them. We all went to the house of the Shekh a little before seven o'clock in the evening. I entered the back door into the square where the women's house was; but declined going so far as their apartment without leave, turning to the left hand into the side of the square where he usually stayed. I was surprised to meet but one servant, a black boy, in the whole house, and he carried me to the Shekh, my servants remaining at the outer door.

Fidele was sitting in a spacious room, in an alcove, on a large broad sofa like a bed, with India curtains gathered on each side into festoons. Upon seeing the boy, in a very surly tone he called for a pipe; and, in much the same voice, said to me, "What! alone?" I said, "Yes, what were his commands to me?" I saw he either was or affected to be drunk, and whichever was the case, I knew it would lead to mischief; I therefore repented heartily of having come into the house alone.

After he had taken two whiffs of his pipe, and the slave had left the room, "Are you prepared?" said he; "have you brought the *needful* along with you?" I wished to have occasion to join Soliman, and answered "My servants are at the outer door, and have the vomit you wanted." He said, with great passion, "I want money, and not poison. Where are your piastres?"—"I am a bad person," said I, "Fidele, to furnish you with

either. I have neither money nor poison; but I advise you to drink a little warm water to clear your stomach, cool your head, and then lie down and compose yourself; I will see you to morrow morning." I was going out. "Hakim," says he, "infidel, or devil, or whatever is your name, hearken to what I say. Consider where you are; this is the room where Mek Baady, a king, was slain by the hand of my father: look at his blood, where it has stained the floor, which never could be washed out. I am informed that you have 20,000 piastres in gold with you; either give me 2000 before you go out of this chamber or you shall die; I will put you to death with my own hand." Upon this he took up his sword, that was lying at the head of his sofa, and, drawing it with a bravado, threw the scabbard into the middle of the room; and tucking the sleeve of his shirt above his elbow like a butcher, said, "I wait your answer."

I now stepped one pace backwards, and dropt the burnoose behind me, holding the little blunderbuss in my hand, without taking it off the belt. I said in a firm tone of voice, "This is my answer: I am not a man, as I have told you before, to die like a beast by the hand of a drunkard; on your life, I charge you, stir not from your sofa." I had no need to give this injunction; he heard the noise which the closing the joint in the stock of the blunderbuss made, and thought I had cocked it, and was about instantly to fire. He let his sword drop, and threw himself on his back on the sofa, crying, "For God's sake, Hakim, I was but jesting." At the same time with all his might he cried, "Brahmin! Mahomet! El coom! El coom!"—"If one of your servants approach me," said I, "that instant I blow you to pieces; not one of them shall enter this room till they bring in my servants with them; I have a number of them armed at your gate, who will break in the instant they hear me fire."

The women had come to the door. My servants were admitted, each having a blunderbuss in his hand and pistols at his girdle. We were now greatly an overmatch for the Shekh, who sat far back on the sofa, and pretended that all he had done was in joke, in which his servants joined; and a very confused, desultory discourse followed, till the Turk, sheriffe Ismael, happened to observe the Shekh's scabbard thrown upon the floor, on which he fell into a violent fit of laughter. He spoke very bad Arabic, mixed with Turkish, as I have often observed. He endeavoured to make the Shekh understand, that drunkards and cowards had more need of the scabbard than the sword; that he, Fidele, and the other drunkard that came to our house two or three nights before, who said he was Shekh of the Jehaina, were just possessed of the same portion of courage and insolence.

* *El coom*, that is, "all his servants."

As no good could be expected from this exposition, I stopt it, and took my leave, desiring the Sheikh to go to bed and compose himself, and not try any more of these experiments, which

would certainly end in his shame, if not in his punishment. He made no answer, only wished us good night.—*Drue's Travels.*

CONCEALMENT OF THE TRUTH.

"THE truth should not be spoken at all times," is one of those convenient sayings which are frequent in the mouths of those men who look upon getting on in this world as the chief end of man, and can pardon any thing but misfortune and ill-success. We do not quarrel with the maxim upon the face of it, but we dread the abuse that may be made of it in the way of application. It degrades to a question of expediency, that which is intrinsically a question of right and wrong. It has a tendency to make men moral cowards, insincere and shuffling traitors to virtue, laying this flattering unction to their souls whenever they are called upon to say a disagreeable truth, and by their very silence doing homage to the evil principle.

It may well be doubted whether the occasions in which the truth ought not to be spoken are not so very rare as to be merely exceptions to a general rule. "The best state," says a Roman historian, "is that in which a man can think as he pleases, and speak as he thinks;" and the sentiment would do honour to a Christian pen. As truth is the highest good, so the search after it, and the contemplation of it, constitute the highest exercise and state of the mind. To speak the truth, is at once our first duty and our noblest privilege. In the eloquent language of Lord Bacon, "the inquiry of truth, which is the love-making or wooing of it; the knowledge of truth, which is the presence of it; and the belief of truth, which is the enjoying of it, is the sovereign good of human nature." The service of truth, which is at once so honourable and so improving, demands the whole man without reserve, qualification or exception. As a good soldier, in entering into battle, does not admit the possibility of a retreat, so he who enlists under the banners of truth, should not admit the possibility of being, even by silence, disloyal to her cause,—of ever entering into any agreement with falsehood, or of ever omitting to show, by positive acts, his steadfast fidelity to his engagements; for sins of omission are sins, as well as those of commission.

The yoke of truth is not easy, nor is her burden light. The expression of Shakspeare, "'tis as easy as lying," has passed into a proverb; and the converse of the proposition is equally true. To speak the truth always and resolutely, requires a robustness of the moral constitution not easily attained, even by those who are compounded of the finest elements. He who would acquire

such, must cast aside all qualifying and temporizing doctrines; as he who aims at a healthy state of body, foregoes intemperance in eating and drinking. In both cases, such conduct is a sacrifice to present self-indulgence, at the expense of future improvement.

A manly adherence to truth is seldom any disadvantage to one, even in a worldly point of view. A sincere man sometimes makes an enemy by his frankness, but he cannot fail of his respect at the same time; and the respect of an enemy is better than the contempt of a friend. Men who carry their hearts upon their lips, and make the honest expression of their sentiments a matter of principle, have, generally speaking, the warmest friends, the most solid esteem, the most extensive influence, and the most lasting peace of mind. Those, on the contrary, who, from interested motives, keep back and disguise their opinions, and turn their sails so as to catch every passing breath of expediency, are seldom trusted. They carry no weight of character with them; if they make few enemies, they make few friends. With all their dextrous management, their ingenious webs of policy, they are always found out; a child can see through the flimsy veil with which they hide their motives, and perceive their selfish essence.

It has been fortunate for the world that there have been men in all ages who have never recognised the authority of such wise saws as the one under consideration, and have devoted themselves to learn the truth, and to declare it at all hazards. What would have been the condition of the world at this time, if Wickliffe and Luther had prudently held their tongues, as, no doubt, many of their judicious friends advised them to? Erasmus was a man who thought the truth was not to be spoken at all times; and with all his learning and talents, what has been his influence upon the world, what is his station in the hearts of the Christian world, compared with that of Luther, his zealous and courageous friend, whom he so often reproves for his rashness, and advises to act with calmness and discretion? The man who follows the dictates of expediency, is like one who, in the night, suffers himself to be guided by a will-o-the-wisp, which may lure him into lonely woods and dangerous morasses. He who follows truth and principle is like the traveller who shapes his course by the polar star, which neither changes nor misleads.

THE SALMON FISHER,

A TALE.

CHAPTER III.

"HEAVEN has decreed that I should make to you a confession of my crime. Your late brother, Sir Charles N****, by whose death you inherit the family estates, was educated with me at the same school. Our dispositions, though considerably opposite to each other, inasmuch as his was passionate and haughty, and mine even, not arrogant,—were far from preventing our mutual esteem; indeed I believe mine was the only temper in the whole establishment at all capable of coping with that of poor Charles; he would sometimes say it was like Minerva's shield, from which the arrows of his own wrath were sure to fall blunted to the ground. It is one thing to possess a bad temper, and another to possess a bad disposition. Charles had an excellent heart; I have known it to suffer greatly from the consequences of his own hasty passions. Many a time have I pleaded his cause against the whole body of scholars; he has wept for gratitude for my triumph; and yet, had I ventured to contradict him an hour after, would have treated me with insolence and contempt. Nevertheless, I believe Charles loved me above all others; I also regarded him beyond every friend. From Eton we became residents of the same college. It was our custom and delight to read and to study together; our books were mutual property. Charles was independent, but I was not. I had the offer of a situation under government; it certainly was my intention to accept it, and my design abundantly strengthened itself in the increasing rather than the diminishing gusts of your brother's temper. People who, as they said, 'knew him,' used to smile at his waywardness; but I could never bring myself to deride the absurdities of a friend. When I mentioned a separation, in consequence of my resolution, Charles, as I expected, burst forth like a madman; he accused me of dissimulation, in professing a friendship for him which, he said, I never entertained; he loaded me with invectives, nay, even with threats, if I dared to leave him. Finding, however, all his indignation insufficient to call from me a look of reproach, he became suddenly much affected, and conjured me, by all our ancient attachment, to remain with him as long as I lived. In a short time he expected to inherit estates to the amount of twenty thousand a year, which it was his best wish I also should enjoy; there was, besides, a valuable living on the eve of coming into his gift; he intended to present me with it. In short, Charles put on so many amiable behaviours, independently of exhibiting such flattering prospects, that I vowed to unite my destiny with his, and to live only where he lived. This was done in the enthus-

astic ardour of youth. Alas! I have thought since it *was* to be, else why should two such opposites so closely link themselves to each other.

"In a short time Charles became master of his property. He had often expressed a wish to make the tour of Europe, and resolved to do it now in what he called style. Of course, as we had vowed never to live asunder, I was his companion. Happy would it have been for me if the vessel that conveyed us from our native shores, had sunk with us to the bottomless depths of ocean; but no, we arrived safe on the continent, and were, for a time, surrounded by every enjoyment which wealth could procure. At Paris we rushed through the mazes of fashion and folly, till we were almost weary of the name of pleasure. It is not material that I dwell on these things; the catastrophe of my story approaches, let me hurry over it, for the recollection which it brings drives me almost to madness.

"It was at Vienna: we had been there about a fortnight, when we were invited to a splendid entertainment given by one of the nobility. Charles and myself were unluckily placed at the same card table, a circumstance I always, if possible, avoided, on account of his quarrelsome propensity; it was not, however, in this instance, to be counteracted. I had been drinking during the afternoon, and came in excellent spirits, which were considerably heightened by an uncommon run of good luck that now attended me. I was thrown quite off my guard, even with respect to Charles. By some means one of the cards, while I was dealing, fell under the table; I did not perceive it; but Charles who, with the rest of the company except myself, was a considerable loser, in struggling with the irritation of his feelings, cast his eyes on the carpet, and discovered the circumstance. The fury with which he had been battling now rushed forth; he never suffered himself to wait for an explanation, but in a frenzy of passion, in a voice hoarse with rage, accused me of the basest and most dishonourable practice. In vain did I attempt to speak; the voice of my own friend condemned me, and no one cared to become my advocate. My offer to return the money I had won, served to increase the general indignation, it looked like a confession of guilt, and was naturally succeeded by an universal burst of the loudest derision. I was under the necessity of quitting that apartment in a manner, and under mortification, the thoughts of which are terrible. As I moved toward the door I encountered the looks of Charles; pale as the sheeted corse, he was leaning against a pillar for

support ; already there was contrition in his features. With a denunciated curse, I lifted up my clenched fist as he fearfully ventured to gaze upon me, and fled from the scene of my disgrace, bearing with me all the agonies of a wounded heart : my uncovered head, exposed to the inclemencies of the night air, my burning temples throbbing from the agitation of my mind. I did not recollect my situation, till I found myself near an old draw-bridge, which crossed a part of the Danube, and conducted to Charles's lodgings. The keeper of this bridge was perfectly known to me ; in passing his dwelling I had often stayed to converse. The night was dark and unusually stormy. Guided by the glimmer of a light which was always suspended on the opposite side of the water, to direct the footsteps of the passengers over the bridge, I entered Kelfine's dwelling. The old man, who was half asleep in his chair, started at the wild and death-like hue of my countenance, rather than at my unusual visit, for I was accustomed to return from Vienna to the château at all hours. I threw myself on a stone bench, and wiping the cold perspiration from my brow, requested a draught of water ; and the better to account for the loss of my hat, and the visible agitation of my mind, insinuated that I had been assaulted by desperadoes. Kelfine, who owed me some obligations, was so exasperated at the insult he readily imagined I had received, that, taking down his fire-arms, he summoned his son from repose, and issued forth, with the intent, if not to detect the assailants, at least to recover my hat from the place from where I pretended to have lost it. My entreaties were of no avail, he would go ; shame forbade me to contradict my assertions : what else can I think than it *was* to be ? It was the unlucky prelude to what ensued. When I found myself once more alone, the sense of the injury, the indignity I had sustained burned more fiercely within me ; I felt like one in the very act of swooning, and throwing open the back door, hurried over a bridge of planks, and entered Kelfine's garden, which ran along the banks of the river, and the border of the road. As I hastened to the rolling waters, I meditated to dash my hated form into their dark recesses. I had worked myself up to a fit of desperation, and was about to take an everlasting plunge, when that voice which alone could have recalled the desperate intention, met my ear. I paused for a moment to listen ; through the range of the trees I could but too well distinguish the once-loved voice of Charles ; he was speaking to his servant, and charging him to return to Vienna, on some commission, the nature of which I would not trouble myself to learn. A demon-like gladness dawned in my heart that I still existed ; a base, horrible thought entered my mind ; my irretrievable wrongs rushed furiously through my blood. I resolved, since fate had thus far assisted me, to take ample re-

venge on my destroyer. I ran, or rather flew, to the draw-bridge ; I had often raised it in sport ; each axle was familiar to my touch ; in an instant it hung in the air by my hand, and Kelfine's beacon-light was placed in such a direction, as to convey to the approaching victim every resemblance of safety. I heard the footsteps of his steed, they were slow and melancholy ; there was an awful chilliness in the sound that made me tremble. Charles, my once-loved friend, rode fearlessly towards the edge of the bridge : I heard his cry of dismay, I witnessed the closing roar of the waters as they wrapt his body in death, and, more dreadful, I heard the echo of my own wild laugh in the air, and imagined it the exulting accent of some infernal agent, who had prompted me to a deed of murder. The chain of the bridge fell from my nerveless grasp, and again the studded oak sank to its resting-place. I had scarcely power to stand, and staggering back to Kelfine's cottage, fell lifeless on the floor.

" On recovering from that too short state of torpor, I found myself in the arms of the old man of the house ; his son was chafing my hands, which were cold as clay. There was a look of inquiry about my attendants that alarmed me. I felt keenly the desolation of my wretched state ; I felt myself that worst of all human monsters—an assassin ! The first idea that came correctly to my mind was a sense of my own danger ; and shaking off the lethargy which hung about my nerves, I placed in the hand of Kelfine a remunerating piece of gold, and hurried to my lodgings. It was no unusual thing for me to arrive late at the château. I had a key by which I could at any time gain my apartment. I passed the remainder of the night in sealing up such papers of importance as belonged to Charles, and directed them to yourself. I also left on my dressing-table a sum of money, more than was due to the hostess ; and, going down to the stable, saddled one of my horses, the other being still at Vienna, and took my departure before dawn. The sun had performed half his course ere I ventured to alight ; conscience seemed to paint the development of my guilt on my features, and I feared each person I encountered should examine them. At length my steed being almost overcome with fatigue, I turned into a solitary and miserable inn, at some distance from the public track, the keeper of which not being accustomed to guests of my appearance, was obsequiously polite, and evidently thought I might consume all the provisions in the province. My appetite, alas, was gone for ever ! While I sat meditating over, rather than taking the refreshments spread before me, I heard a loud cry of distress : there was a time when such a sound had merely awoken within me a sensation of surprise, it now almost shattered my frame ; a strange impulse directed my eyes to the lattice ; they

were bringing the body of a drowned man from the river, which rolled heavily past the back paling of the inn. What motive could induce me I know not, but I pressed involuntarily forward to examine, with others, the features of the corse, as they extended it on the grass. All-seeing God! the torture of that instant is never to be exceeded, even by whole years of misery. It was the body of my friend, which Heaven had directed along the dark current of waters, to flash conviction in the murderer's face! I recoiled, in the distraction of my soul, from the appalling sight, and yet an unaccountable fortitude sustained me at that dreadful crisis; I had virtue enough left within me to be assured that your brother received an honourable interment; and I hope the trial which that delay occasioned my heart, added to the repentant tears with which I watered his grave, may hereafter plead for me. Heaven knows, during that suspense, I resigned myself as lost, and dreaded each approaching footstep as some arresting accuser. From this place I hurried, unsuspected and unmolested, to Switzerland, and buried my remorse in its wildest seclusions. It was among these mountains I first beheld Stella. Mine was the life of a hermit; I seldom quitted the cabin in which I first took up my residence. Illness well-nigh sunk me to the grave, when the old goatherd, who was in the habit of contributing to my little wants, apprised Stella's father of the circumstance; with the voice of a ministering angel he stood before me; like myself he had been unfortunate, but not guilty. He endeavoured equally to mitigate my cares and my disorder. He knew not that both alike were incurable. Had not my heart been too seared Stella's piety and innocence must have inspired it with the softest passion. Her father was the director of the rude peasantry on their way to heaven; she was his only child, his only relative. He had little to bequeath, but he was too good a divine to doubt the bounty of Omnipotence. A short time convinced me that I had kindled a regard in Stella's bosom which I could never return with my hand; I loved her, but I loved her too tenderly to think of uniting her to a wretch so offending as I had been. The sudden death of her father left her without a friend, except myself; and a new and remarkable circumstance which occurred made me resolve to quit Switzerland. My fears, my conscience never slept: there was a person come to settle in one of the cottages—he was a stranger; when the report reached me I was on the rack of inquiry; I believed that he could be nothing less than some minister of justice waiting to apprehend me. By a winding descent, I contrived secretly to approach the residence of the unknown; and concealing myself among the bushes, what was my consternation at beholding, in the residents of the valley, Kelfne and his son. I hurried back to my habitation, and shutting my-

self up till night, did not dare to go abroad. When it was dark, I went to take an eternal farewell of Stella; I assured her that my life was in danger; that it was not possible for me to remain any longer in Switzerland. The friendless, unprotected Stella, threw herself on the earth at my feet, and bathed in grief, besought permission to attend me. She was the only human being to whom I could attach myself; her extreme youth, her heart-rending tears, her supplications, prevailed—we fled together. The vessel in which we sought Scotland was wrecked, but I was not yet to perish! The asylum of this valley seemed to offer me a retreat almost unfrequented; yet even here the eye of an avenging Power, in yourself, has pursued me. The form of Charles has never left me. I call upon you for forgiveness; I have saved your life although I destroyed that of your brother. You will not—you cannot refuse to protect Stella. On my knees I ask it. She will prove a blessing, for which God will bless you—.”

Thus ended this singular manuscript. It was most true that my brother had been drowned abroad; letters from the place, and other circumstances, had assured us of the fact. The most convincing document was traced, as I could now perceive, by the pen of his unfortunate friend. Near as Sir Charles was to myself, I could not but pity the man, whose best hopes he had so prematurely blighted; and, on concluding his narrative, the first impulse of my heart suggested that I should shelter him from danger, and bury his secret in oblivion. I know not how far such a resolution may be consistent with the feelings of others, but I have since been gratified that it was consistent with mine.

The morning, with its earliest beams, found me still meditating on the contents of the narrative, and the best steps for me to pursue; I had not even thrown off my clothes, when the sound of some one knocking hastily at the door of my chamber startled me. I arose from the chair on which I had been seated during the whole night, and felt not a little surprised by the ghastly features of my landlady, who came to inform me that something terrible had occurred to Rholf. I guessed every thing—and, accompanied by Donald, went immediately to the cabin. On the way, I learnt from one of the salmon fishers, that Rholf had recommended Stella to retire earlier than usual to rest; thrice he had evinced a composure which lulled her into compliance. After a short space, however, the sound of footsteps assured her that he had left the cottage; and opening the lattice to listen, the report and flash of a pistol, at some distance, filled her with indescribable alarm. It was also witnessed by one or two of the peasants—they rushed to the spot—Stella's fears were but too well founded—Rholf, the heart-broken Rholf, had shot himself!

On entering the cabin, I shall never cease to remember the affecting picture. Rholf was not quite dead, nor insensible; a stream of blood trickled from the bandage which confined his temples, and served to render the livid hue of his cheek more ghastly. Stella, with his icy hand locked in hers, was kneeling, the awful image of despair, beside him. He turned his eyes to me as I entered; there was a mingled hue of shame and contrition upon his countenance. He received my hand with an effort almost beyond his strength, and pressing it to his dying lips, "You forgive!" said he, faintly; "As Heaven, I hope, will me and all sinners," answered I. He shook his head sorrowfully; the weight of his last offence was upon him. It was no time for reproach—awful are the struggles of the dying suicide—life was fast ebbing. He looked from me to Stella; I gave him to understand that I adhered to his last injunction, he feebly pressed my hand as a token of his gratitude. In the course of an hour his senses were quite gone. He talked incessantly of Charles, it was the latest word that escaped him. We buried him by moonlight on the borders of the Frith, on the spot which he often selected while living; and, according to his own request,

sculptured on the entombing rock which overhangs his ashes: "*The grave of a Salmon Fisher.*"

Contrary to my expectations, Stella did not give way to a violent excess of despair: with unheard of fortitude she attended the remains of Rholf to his narrow tomb. She acknowledged till my arrival in the glen, being ignorant of his crime. Rholf had since that time communicated to her the fatal secret. I hoped by the calmness of Stella's manner, she might be induced to accept from me the offers Rholf had refused, and receive my protection with my hand. But I was mistaken; Stella's though a still suffering spirit was a noble one. She proclaimed not her lamentations to the world, but the canker-worm of grief preyed upon her broken heart, and she proved both her constancy and affection, a short period after his decease, by expiring on the tomb of the man she loved. Half a century has almost elapsed since these incidents took place, but the image of Stella and the salmon fisher have seldom been absent from my mind. There is an important moral to be extracted from the story and fate of the latter, which I trust and hope may not prove unserviceable to the victim of un-governed passion.

THE MYSTERIOUS SHIP.

WHETHER death is an eternal sleep, or whether it introduces us to another state of existence, it is an awful thing to die. It is very certain that reason is not able to demonstrate an immortal state of happiness or misery beyond the grave. The probabilities are all in its favour, but we want more decisive evidence; and the want increases to agony as we apprehend the approach of death to ourselves. What mankind are indebted to the ancient philosophers, to Jesus Christ, and to modern infidels, will appear from the following allegory, which is no fable.

There is a country whose shores are periodically visited by a mysterious ship from some far distant and unknown land. Its arrival never fails to inspire the inhabitants with dread and terror, for an armed band on every visit ravages the whole territory, and seizes innumerable victims, of every age, of each sex. Such was the case for ages, before any effort was made to repel the invaders. All submitted with silent awe; one generation was taken away, another, and another, and no one knew whither the reluctant voyagers were bound, for no one ever returned to report to his fellows his own or their destination. Yet the ship was ever and anon anchoring in the harbour, and always departed with the spoils of humanity—the noble, the youthful, the wise, the witty and the gay, the rich and the poor, the tyrant and the slave, the mother and the tender infant at her bosom. During a succession of ages, curiosity was intensely excited: the profound speculated;

the benevolent searched, and searched in vain for hope; the wise, the grave, and the learned, all strove to allay the universal anxiety, and to soothe their own hearts under the appalling assurance, that they too must obey the inexorable mandate, and be launched on that ocean, where, for aught they knew, their entire species would, sooner or later, be engulfed. As these venerable sages retired, unable to solve the enigma, or to tell any thing satisfactory either of the ship or of the fate of those it daily and hourly was forcing from their native shores, "a mild form of humanity," meek in wisdom, with the light of heaven radiating his brow, and the tenderness of the softest compassion touching and animating his features, was seen advancing; his voice of majesty hushed all the wailings of the bereaved and the sorrowing. He allayed every fear; the ship, he said, belonged to the country from whence he came, where he had dwelt; that the multitudes, which had been for so many generations the captives of its power, were removed to permanent habitations, where they were happy or miserable, according to the characters they had formed and sustained in the society from whence they were taken; that the happiness of the good and virtuous was inconceivable, and that the misery of the vicious and the bad was just in proportion to their guilt, but that both were placed in an unchangeable state; that he had the power of so preparing them all for their mysterious voyage that if they would place themselves under his guidance and protection, he would secure their

cordial reception in those realms of blessedness from whence he had come, and to which he was about to return; that he had absolute authority, both over the ship and the ministers of destiny, which were so often making their incursions among them; that before their eyes he would go and return the veritable Being who stood before them; and that his principal object in visiting them was, to make them ardently desire and long for the voyage they had contemplated with dismay. At the close of his address heaven opened, and a voice from the excellent Glory said, "This is my beloved Son in whom I am well pleased." All manner of diseases fled at his bidding; the dead were raised, and evil spirits at his rebuke vanished into the outer darkness. From the voyage which he said he would take, he did not shrink; and on a tempestuous night, when such a storm as earth nor ocean ever witnessed before or since, raged with a fury which threatened the wreck of nature itself, he embarked, and on the third day returned, while a thousand harmonies rolled along the glorious anthem which hailed the deliverer of men, under the endearing character of the "Resurrection and the Life." But what means the rabble rout, who have grotesquely assumed the toga of philosophy, while, in their moral qualities they be-

tray their affinity to the fabled satyrs of an exploded superstition? Hurrying forward to meet the ship at its next visitation, who is it they insult with their ribaldry? Can it be the great Teacher who has calmed the fears, and inspired the hopes of so many millions of our race? Is he, and the light which he has poured upon the dark ocean of futurity, the object of their contumely and scorn? Is it the star by which this ship of heaven tracks its way over the pathless deep, and arrives so surely at its destined port, which provokes the hootings of these birds of night? O! is it their ambition to extinguish every light in the great cemetery of human nature, and to leave nothing radiant but the letters on its portals, proclaiming death to be "an eternal sleep;" but which the moanings, and fitful sighs, and the groans of agonized spirits coming from out the darkness contradict and belie, which find their echo in those bosoms in which there is a "fearful looking for of judgment and fiery indignation?"

My brethren, need I add another touch to this scene? Philosophy without the Scriptures is no guide into futurity. Infidelity against the Scriptures is not merely a mistaken guide, but a desperate and malignant foe.—*Styler's Lecture on the Inspiration of the Bible.*

GEMS.

[From Hazlitt's *Characteristics*.]

The little volume, from which the following selections, taken almost at random, are made, we are told was originally printed without Mr. Hazlitt's name. There could never have been any disguise of the authorship, from those who knew any thing whatever of his style. The book is full of one-sided truths—of imperfect truths—of no truths at all,—but also of very many deep revelations and distinct exhibitions of our moral nature. Here we have, "in the rough," all the author's well-known theories of human character and action; as well as his happiest principles of criticism on poetry and the arts.

We open the leaves at a very masterly refutation of the reasonings of *Mandeville* and *Roche-foucault*.

The error in the reasonings of *Mandeville*, *Roche-foucault*, and others is this: they first find out that there is something mixed in the motives of all our actions, and they then proceed to argue, that they must all arise from one motive, viz., self-love. They make the exception the rule. It would be easy to reverse the argument, and prove that our most selfish actions are disinterested. There is honesty among thieves. Robbers, murderers, &c., do not commit those actions, from a pleasure in pure villainy or for their own benefit only, but from a mistaken regard to the welfare or good opinion of those with whom they are immediately connected.

It is ridiculous to say, that compassion, friendship, &c., are at bottom only selfishness in disguise, because it is we who feel pleasure or pain in the good or evil of others; for the meaning of self-love is not that it is I who love, but that I love myself. The motive is no more selfish, because it is I who feel it, than the action is selfish, because it is I who perform it. To prove a man selfish, it is not surely enough to say, that it is he who feels, (this is a mere quibble,) but to show that he does not feel for another; that is, that the idea of

the suffering or welfare of others does not excite any feeling whatever of pleasure or pain in his mind, except from some reference to or reflection on himself. Self-love, or the love of self, means that I have an immediate interest in the contemplation of my own good, and that this is a motive to action; and benevolence, or the love of others, means in like manner that I have an immediate interest in the idea of the good or evil that may befall them, and a disposition to assist them in consequence. Self-love, in a word, is sympathy with myself, that is, it is I who feel it, and I who am the object of it; in benevolence or compassion, it is I who still feel sympathy, but another, not myself, is the object of it. If I feel sympathy with others at all, it must be disinterested. The pleasure it may give me is the consequence, not the cause, of my feeling it. To insist that sympathy is self-love because we cannot feel for others, without being ourselves affected pleasantly or painfully, is to make nonsense of the question; for it is to insist, that in order to feel for others properly and truly, we must in the first place feel nothing. *C'est une mauvaise plaisanterie.* That the feeling exists in the individual must be granted, and never admitted of a question; the only question is, how that feeling is caused, and what is its object—and it is to express the two opinions that may be entertained on this subject, that the terms, "self-love" and "benevolence," have been appropriated. Any other interpretation of them is an evident abuse of language, and a subterfuge in argument, which, driven from the fair field of fact and observation, takes shelter in verbal sophistry.

The confession of our failings is a thankless office. It savours less of sincerity or modesty than of ostentation. It seems as if we thought our weakness as good as other people's virtues.

A man who is always defending his friends from the

most trifling charges, will be apt to make other people their enemies.

It has been observed, that the proudest people are not nice in love. In fact, they think they raise the object of their choice above every one else.

The greatest hypocrites are the greatest dupes. This is either because they think only of deceiving others and are off their guard, or because they really know little about the feelings or characters of others from their want of sympathy, and of consequent sagacity. Perhaps the resorting to trick and artifice in the first instance, implies not only a callousness of feeling, but an obtuseness of intellect, which cannot get on by fair means. Thus a girl who is ignorant and stupid may yet have cunning enough to resort to silence as the only chance of conveying an opinion of her capacity.

There are many who talk on from ignorance, rather than from knowledge; and who find the former an inexhaustible fund of conversation.

We are more jealous of frivolous accomplishments, with brilliant success, than of the most estimable qualities without it. Dr. Johnson envied Garrick whom he despised, and ridiculed Goldsmith whom he loved.

It argues a poor opinion of ourselves, when we cannot admit any other class of merit besides our own, or any rival in that class.

To deserve any blessing is to set a just value on it. The pains we take in its pursuit are only a consequence of this.

The amiable is the voluptuous in expression or manner. The sense of pleasure in ourselves is that which excites it in others; or, the art of pleasing is to seem pleased.

Let a man's talents or virtues be what they may, we only feel satisfaction in his society, as he is satisfied in himself. We cannot enjoy the good qualities of a friend, if he seems to be none the better for them.

True modesty and true pride are much the same thing. Both consist in setting a just value on ourselves—neither more nor less. It is a want of proper spirit to fancy ourselves inferior to others in those things in which we really excel them. It is conceit and want of common sense to arrogate a superiority over others, without the most well-founded pretensions.

The truly proud man knows neither superiors nor inferiors. The first he does not admit of; the last he does not concern himself about. People who are insolent to those beneath them, crouch to those above them. Both show equal meanness of spirit and want of conscious dignity.

There is neither so much vice nor so much virtue in the world, as it might appear at first sight that there is. Many people commit actions that they hate, as they affect virtues that they laugh at, merely because others do so.

Our opinions are not our own, but in the power of sympathy. If a person tells us a palpable falsehood, we not only dare not contradict him, but we dare hardly disbelieve him to his face. A lie boldly uttered has the effect of truth for the instant.

A man's reputation is not in his own keeping, but lies at the mercy of the prodigality of others. Calumny requires no proof. The throwing out malicious imputations against any character leaves a stain which no after refutation can wipe out. To create an unfavourable impression, it is not necessary that certain things should be true, but that they have been said. The imagination is of so delicate a texture, that even words wound it.

A nickname is a mode of insinuating a prejudice against another, under some general designation, which, as it offers no proof, admits of no reply. It does not render the person less contemptible or ridiculous in vulgar opinion, because it may be harmless in itself, or even downright nonsense. By repeating it incessantly, and leaving out every other characteristic of the individual, whom we wish to make a by-word of, it seems as if he were an abstraction of insignificance.

Want of principle is power. Truth and honesty set a limit to our efforts, which impudence and hypocrisy easily overleap.

It is wonderful how often we see and hear of Shakespeare's plays without being annoyed by it. Were it any other writer, we should be sick to death of the very name. But his volumes are like that of nature, we can turn to them again and again:—

"Age cannot wither, nor custom stale
His infinite variety."

Even among the most abandoned of women, there is generally found to exist one strong and individual attachment, which remains unshaken through all circumstances. Virtue steals, like a guilty thing, into the secret haunts of vice and infamy, clings to their devoted victim, and will not be driven quite away. Nothing can destroy the human heart.

We find persons who are actuated in all their tastes and feelings by a spirit of contradiction. They like nothing that other people do, and have a natural aversion to whatever is agreeable in itself. They read books that no one else reads; and are delighted with passages that no one understands but themselves. They only arrive at beauties through faults and difficulties; and all their conceptions are brought to light by a sort of Cæsarean process. This is either an affectation of singularity; or a morbid taste, that can relish nothing that is obvious and simple.

The greatest offence against virtue is to speak ill of it. To recommend certain things is worse than to practise them. There may be an excuse for the last in the frailty of passion; but the former can arise from nothing but an utter depravity of disposition. Any one may yield to temptation, and yet feel a sincere love and aspiration after virtue; but he who maintains vice in theory, has not even the idea or capacity for virtue in his mind. Men err: fiends only make a mock at goodness.

There are some things the idea of which alone is a clear gain to the human mind. Let people rail at virtue, at genius, and friendship, as long as they will, the very names of these disputed qualities are better than any thing else that could be substituted for them, and embalm even the most angry abuse of them.

Were good and evil ever so nearly balanced in reality, yet imagination would add a casting weight to the favourable scale, by anticipating the bright side of what is to come, and throwing a pleasing melancholy on the past.

The difference between the vanity of a Frenchman and an Englishman seems to be this:—the one thinks every thing right that is French, the other thinks every thing wrong that is not English. The Frenchman is satisfied with his own country; the Englishman is determined to pick a quarrel with every other.

An accomplished coquette excites the passions of others in proportion as she feels none herself. Her forwardness allures, her indifference irritates desire. She fans the flame that does not scorch her own bosom; plays with men's feelings, and studies the effect of her several arts at leisure and unmoved.

SPECIMENS OF A NEW DICTIONARY.—No. I.

ABLUTION.—One of the eldest rites of religion. Physical sanctification. To the Jew it was the type of an inward cleansing; to the Hindoo it is the whole of religion; to the mere nominal Christian, as administered in baptism, it seems to act as a dispensation from all religion.

ABSOLUTION.—When pronounced by man is an impious usurpation of the highest prerogative of God; a forgery of the Great Name of God on the bank of Mercy; a sacrilegious and clandestine employment of the great seal of Heaven for purposes of party aggrandizement; a cheat put on an immortal soul by which it may be defrauded of eternal happiness. Compared with this, he who is fabled to have stolen fire from heaven—he who aspired to drive the chariot of the sun—and he who appropriated the thunders of Jove, were only toying. According to the blasphemy of the councils of Trent and Florence, the Divine Being himself cannot pardon, (awful blasphemy!) unless the priest be willing. A more modern church professes to disown the *power* of absolution, but retains the *form*. Her form of absolution, professedly differs from that of the Romish church in being only *ministerial* or *declarative*; which, in the eyes of the ignorant many, must look like a distinction without a difference; and in the eyes of the educated and unprejudiced few, like the analytic powers of that famed theologian

“Who could distinguish and divide
A hair, ’twixt south and south-west side.”

But surely on a subject so solemn, such hair-splitting is worse than trifling.

ABSTINENCE.—A lost virtue. It is observable that churches which prescribe fasts, atone for it by prescribing feasts also—lents and carnivals alternate. The golden mean is habitual temperance; which, as opposed to gluttony, is a perpetual fast, and, as opposed to abstinence, a perpetual feast.

ACCLAMATION.—The mechanical agitation of the air: *alias*, glory, fame.

ANGER.—The apoplexy of the soul.

BIBLE.—Distinguished from every other book professedly divine, by its earnest commendations of knowledge; its solemn commands to acquire it; its power of creating a thirst for it; and by its manifest intention of gratifying that thirst with a river clear as crystal.

CUSTOM.—The great Pedagogue, who requires his pupils to believe without reason, and to obey without examination.

DEEDS.—Noble deeds are great truths realized.

EXPERIENCE.—A fragrant flower that grows on the grave of the past.

FEAR.—The palsy of the soul.

GOODNESS.—“The parts and signs of goodness are many,” saith Bacon. If a man be gracious and [No. 11. MARCH 15, 1837.—2d.] VOL. I.

courteous to others, it shows that he is a citizen of the world; and that his heart is no island cut off from other lands, but a continent that joins to them. If he be compassionate towards the afflictions of others, it shows that his heart is like the noble tree that is wounded itself when it pours out its balm. If he easily pardons offences, it shows that his mind is planted above injuries, so that he cannot be shot. If he be thankful for small benefits, it shows that he weighs men's motives and not their trash. But above all, if he have St. Paul's perfection, that he would wish to be an anathema, for the salvation of his brethren, it shows much of a divine nature, even a kind of conformity to Christ himself.

HERESY.—A morbid excrescence cut off from the body ecclesiastic; the existence of which, however, indicates that the body itself is in an unhealthy state. Originally, the term heresy had no *evil* import; it simply meant a *party*, whether good or bad, distinguished from another *party*. The pharisees themselves—the great religious body of the Jews—are called a “sect,” or “heresy.” Hence the Apostle Paul, when defending himself before Agrippa, says that he “lived a Pharisee, according to the strictest *αἵρεσις*, heresy or sect, of their religion.” Josephus also, himself a pharisee, speaks of the heresy of the pharisees, as excelling others in the knowledge of the Jewish law. Christians originally formed the heresy of the Nazarenes. But Bigotry has placed the word among her numerous synonyms of evil. And what wonder, when the very elements themselves have been pressed into her service, and she has talked of the “Protestant winds,” and the “Popish tides.”

INDEX EXPURGATORIUS.—The Pope's Annual. The Cardinals' Review. A bar thrown across the stream of intellectual commerce.

KNOWLEDGE.—A molehill in the Amazon valley of our ignorance.

LOGIC.—The scaling ladder employed in storming the citadel of truth.

MISER.—His head is one entire organ of acquisitiveness. A living volume of political economy shabbily bound. A great family *save-all*, whose light during life is under a bushel, and expires, at last, in a stench. He would think it prodigal to *give* away even his affections; and, therefore, instead of marrying, *keeps* a mistress—gold. He has the honour of giving a name to the large family of the *miserable*, and of greatly augmenting its numbers.

NONSENSE.—Every one's sense that opposes us.

OPINION.—A brat, not begotten, but adopted; but retained and defended as pertinaciously as if it were begotten; as the sparrow treats the cuckoo—and its note like the cuckoo's too.

PERSECUTION.—To make excellent persecutor,

M

take equal parts of ignorance, the root of which has grown for ages in the same spot—prejudice, that has flourished and grown rank in the damp and shade of a venerable wall—and of power, *quantum suff.*—mix, and let them stand till they ferment. If necessary, agitate them a little, and fermentation will instantly ensue. This mixture has never been known to fail.

QUESTIONS.—Yes, and no, are made to answer most questions ; properly speaking, however, they can answer but very few ; for there are but few absolute affirmatives or negatives in our possession ; the terms require modification.

RIDICULE.—There is nothing more ridiculous than a real grief.

SIGNS.—The heart's funeral oration over the past.

TRUTH.—A farthing candle in a fog.

VANITY.—The victim of a principle.

WORLD.—A green meadow in which men love to lie down, forgetting the proverb, that there is a snake in the grass.

ZEAL.—The soul in a state of combustion. Milton, in his "Apology for Smectymnus," having shown that all the natural passions of humanity were in Christ, and that what was all in him was

divided among his ministers—some to be mild and others severe, some to be grave and others cheerful ; "no man being forced wholly to dissolve the ground-work of his nature—the sanguine to empty out all his sociable liveliness—or the choleric to expel the unsinching predominance of his anger"—begs leave "to soar awhile as the poets use," in praise of zeal. "Zeal, whose substance is ethereal, arming in complete diamond, ascends his fiery chariot, drawn with two blazing meteors, figured like beasts, but of a higher breed than any the zodiac yields, resembling two of those four which Ezekiel and St. John saw ; the one visaged like a lion, to express power, high authority, and indignation ; the other of countenance like a man, to cast derision and scorn upon perverse and fraudulent seducers : with these, the invincible warrior, Zeal, shaking loosely the slack reins, drives over the heads of scarlet prelates, and such as are insolent to maintain traditions, bruising their stiff necks under his flaming wheels. Thus did the true prophets of old combat with the false ; thus Christ himself, the fountain of meekness, found acrimony enough to be still galling and vexing the prelatical pharisees."

A SCOTTISH SACRAMENT.

CHAPTER I.

THE question, Who is Christ ? was once put to me, in a manner and under circumstances which will never fade from my memory ; and perhaps the knowledge of them may not be wholly vain and profitless to the world.

On the morning of a Sabbath day, in the month of June, I was up betimes, as I had resolved to go where, according to the custom of that part of the country, the sacrament of the Lord's Supper was to be dispensed, at a parish church some twelve or fourteen miles distant, and several of the most distinguished preachers of the district were to unite their labours on this solemn occasion. I had not walked above half a mile up the hill from my father's house when I met with Tom Allan. Tom and I had never been together on a Sabbath day, but as week-day friends we were very intimate. The plantations of young firs and larches on the hill gave shelter and accommodation to vast numbers of birds ; and in the delightful days of spring the cheerful warblings of the songsters, and the melancholy moaning of the ringdove, attracted Tom and I to spend many an hour in their sylvan abode. The dell also, with its clear winding stream, its rifted rocks, and its tangled thickets, with the gurgling rapid, and the sounding cascade, had many fascinations for the young. Tom and I studied ornithology in the wood, and botany in the dell ; and if our studies were not conducted in strict accordance with the canons of science,

they were delightful to us, and it may be saved us from plunging into vices to which spirits so young and so buoyant might otherwise have been prone. Tom was intelligent and amiable ; he was a lover of nature, and not without reverential feelings for the God of nature. Of the God of grace he was however altogether ignorant ; because the light of Divine truth had not illuminated the dwelling of his father.

Meeting Tom, as I have said, on the sweet morning of the summer Sabbath, he hailed me with, "How glad I am to have met you ; how sweet the songs of the birds are ; let us visit them in their sylvan habitations, and spend the live-long day in the observation of that nature which is so beautiful."

"My dear Tom," said I, "delightful as the woodlands are, this is not the morning for resorting to them : I am going a farther distance, and for a different purpose ; and when I mention it to you, perhaps you will accompany me."

"Whither are you going, and what is your purpose ?" said Tom.

"I am going," I replied, "to the parish church at B—, where there is this day to be solemnised the emblematical resemblance of the death of Christ, and of all that he did and suffered to restore fallen man to the grace and favour of Almighty God, and to a life of happiness exempt from pain, sorrow, and death."

"Who is Christ ?" asked Tom, with the same

single-heartedness with which he and I were accustomed to question each other when either the one or the other was run aground on the subjects of our humble but heartfelt contemplations.

"I cannot tell you at a word, Tom," said I; "but come along with me, and perhaps you may learn; you and I, you know, like better to teach ourselves than to be taught."

He instantly agreed; and we went on our way talking upon such subjects as might be supposed to be most interesting to youths of our age—youths, I may add, with little knowledge, but with no guile.

Here I must candidly confess that, though I had been brought up strictly in what is called a religious manner, the love of religion was not my only motive for going to this distant sacrament. There were many charms by the way. It led over the top of a hill, where a large stone cross marked the spot where, in times of old, the general of an invading army had fallen, after the total rout of his troops on the plain below. The summit of this hill commanded an extensive view of a country quite new to those on the other side, exceedingly rich and beautiful, and now covered with luxuriant fields of wheat, and perfumed with beans in full blossom. This made our journey feel shorter than it was in reality; and though we spake but little we saw much. The rich green plain was margined by a sandy beach, along which the waves rolled in a small line of silvery foam. In the offing, a reef of rocks, which had been fatal to many a mariner, showed their crests by a covering of the same colour; and beyond them the sea appeared boundless, and its waters reduced to perfect tranquillity. There were thus the emblems of wealth, and danger, and immortality before us. I have often reflected on them since; but I believe, at the time, I was more occupied with the simple gratification of the senses.

We reached the church village in time to rest ourselves before the service of the day commenced, and also to look around us. The school-master's garden was full of beautiful flowers; and he and his family, as we could hear by the sound of sacred music, were preparing by worship in the family, for the more solemn rites of the church. The church was a very humble and old fashioned structure, (I have always admired old churches; for they tell at once that the people have been Christian for many generations). It stood on a rising ground, with the simple memorials of the dead on the green sward around it. Below there was a little dell with a small stream of clear water; and beyond this there rose a soft grassy bank, forming a curve, with its middle bent from the point at which the church stood. In the dell, close by the bank of the stream, there was placed that temporary sort of covered pulpit which, in that part of the country, is called "the tent," the opening

of the tent being toward the middle of the bank, and almost equally distant from every part of its circumference. The object of placing the tent here, was to make up for the smallness of the church, which was quite inadequate to accommodate the crowds which collected there on those solemn occasions. Psalms, prayers, and sermons were alternately kept up in it during the morning service, while the more solemn rites were performing in the church; and in the evening, when the service became like that of an ordinary Sabbath, the whole assembled together in this rustic temple.

On these occasions the gallery of the parish church of B— was set apart for those who were yet too young for sitting down at the communion table in fellowship with the church; but who were understood to be preparing themselves for arriving in due time at that sacred honour; an honour which there and then was accounted a principal epoch in the life of the party. We of course took our station there; and as there was no distinction of pews on the sacrament Sabbath, and we were early, we took our seats in the front of the gallery. When the little bell began to tinkle, the people moved slowly and silently into the church, till every part of it was full. The aged, the infirm, and some of the leading people of the parish occupied the communion table, which extended along the middle of the church, with the pulpit against the south wall opposite the middle of it, where, however, a division was left by which a passage could easily be obtained from the one side to the other. The symbolic bread and wine, covered up with white cloths, were placed at each side of this opening; and some of those ministers who were to assist in the service of the day, and also the elders of the congregation, were seated close by.

After all had been seated in due order, Dr. S., the parish minister, made his appearance in the pulpit: and the sweetness of the day, the stillness of the scene, and the expression of anticipation and hope upon most countenances, rendered even the still life of it impressive, and showed clearly how necessary a sober deportment is, for preparing the mind for religious rites. The doctor, after a little pause, rose, and with a suitable preparation read the psalm with which the service of the day was to begin:—

"We'll go into his tabernacles,
And at his footstool bow:
Arise, O Lord, into thy rest,
The ark of thy strength and thou.
"O let thy priests be clothed, Lord,
With truth and righteousness;
So shall all those that do thee fear,
Shout loud for joyfulness."

These are not the whole, but only a specimen; and Dr. S. had a method in reading the sacred lyrics of his church which was peculiarly expres-

sive ; and the earnestness with which he enunciated the second of these stanzas, turned it to a fervent prayer for Divine grace to strengthen him and his assistants for the performing aright of their duty to God and God's people.

I saw that Tom Allan's attention was fixed at the outset ; for he did not once move his eye off the doctor all the time that the latter was reading the psalm. The psalm was taken up by the whole congregation. The tune was " Martyrs," wild and wailing in its melody, like the voices of the persecuted remnant crying to their God from the fastnesses of the mountains when the sword of the oppressor was gleaming on the plains. I felt it, perhaps, in a peculiar manner, because my father had previously told me that we too had witnessed for the Zion of our God in the day of her greatest tribulation, when the Lord saw meet to try them according to his word, as declared by the prophet Zechariah, in the last verse of his thirteenth chapter, " I will bring the third part through the fire, and will refine them as silver is refined ; and try them as gold is tried ; they shall call on my name, and I will hear them : I will say, It is my people : and they shall say, The Lord is my God."

If Tom Allan had not had much experience in psalmody, he had an ear and a voice for music ; and before the psalm was half concluded I could hear him taking the lead in that part of the gallery where we sat, and singing with a fervent enthusiasm which I have not often observed. Indeed, he entered at once into the service with a degree of earnestness which I certainly did not feel, though I had frequently been present at such scenes.

The prayer which followed in the order of the service, was highly appropriate in the sense and fervent in the expression. It began with a deep confession of the general depravity of human nature, and of the particular depravity of every individual in the sight of a God " glorious in holiness," whatever that individual might appear in the sight of men. Having set before the assembled people this their true natural condition, it directed their thankfulness to the Almighty for every blessing and enjoyment, and more especially for salvation through the sufferings and death of Jesus Christ, and for the privilege of serving God in his own temple, according to the ordinances of his holy word. The supplications for pardon and guidance were so framed as to meet the particular cases of all present ; and the doctor was peculiarly earnest in imploring Divine grace to strengthen him and his fellow-labourers, so that they might be useful to man, and approved in the sight of God, not only during that solemn day, but during all the days of the years of their sojourn upon earth. It is not the custom of the church to which Dr. S. belonged to give audible responses ; but there were responsive sighs from some parts of the congregation ; and the deep attention of the whole might be regarded as one general response to the entire prayer. My companion seemed equally attracted by this as by the psalm, if not more so ; and I am sure that he was more instructed ; for there was embodied in the prayer a brief but clear abstract of the peculiar doctrines of Christianity, — a short answer as it were to Tom Allan's question, " Who is Christ ?"

THE CHASSEUR ANTS.

(From Mrs. Carmichael's " Domestic Manners and Society in the West Indies.")

ONE morning my attention was arrested at Laurel Hill, (Trinidad,) by a number of black-birds whose appearance was foreign to me ; they were smaller but not unlike an English crow, and were perched on a calabash tree near the kitchen. I asked D., who at that moment came up from the garden, what could be the cause of the appearance of so many of those blackbirds. She said, " Misses, dem be a sign of the blessing of God ; dey are not the blessing, but only de sign, as we say, of God's blessing. Misses, you'll see afore noon time, how de ants will come and clear de houses." At this moment I was called to breakfast, and thinking it was some superstitious idea of D.'s I paid no further attention to it. In about two hours after this, I observed an uncommon number of chasseur ants crawling about the floor of the room ; my children were annoyed by them, and seated themselves on a table, where their legs did not communicate with the floor.

They did not crawl upon my person, but I was now surrounded by them. Shortly after this the walls of the room became covered by them, and next they began to take possession of the tables and chairs. I next thought it necessary to take refuge in an adjoining room, separated only by a few ascending steps from the one we occupied ; and this was not accomplished without great care and generalship ; for had we trodden upon one, we should have been summarily punished. There were several ants on the steps of the stair, but they were not near so numerous as in the room we had left, but the upper room presented a singular spectacle ; for not only were the floor and walls covered like the other room, but the roof was covered also.

The open rafters of a West India house at all times afford shelter to a numerous tribe of insects, more particular the cockroach ; but now their destruction was inevitable. The chasseur-ants,

as if trained to battle, ascended in regular thick files to the rafters, and threw down the cockroaches to their comrades on the floor, who as regularly marched off with the dead bodies of the cockroaches, dragging them away by their united efforts with amazing rapidity. Either the cockroaches were stung to death on the rafters, or else the fall killed them. The ants never stopped to devour their prey, but conveyed all to their storehouse. The windward windows of the room were glass, and a battle now ensued between the ants and jack-spaniards, hotly pursued on the panes of glass. The jack-spaniard may be called the wasp of the West Indies; it is twice as large as a British wasp, and its sting is in proportion more painful. It builds its nest in trees and old houses, and sometimes in the rafters of a room. The jack-spaniards were not quite such easy prey, for they used their wings, which not one cockroach had attempted. Two jack-spaniards, hotly pursued on the window, alighted on the dress of one of my children. I entreated her to sit still, and remain quiet. In an almost inconceivable short space of time, a party of ants crawled upon her frock, surrounded, covered the two jack-spaniards, and crawled down again to the floor, dragging off their prey, and doing the child no harm. From this room I went to the adjoining bed-chamber and dressing-room, and found them equally in possession of the chasseurs. I opened a large military chest of linens, which had been much infested; for I was determined to take every advantage of such able hunters; I found the ants already inside; I supposed they must have got in at some opening at the hinges. I pulled out the linens on the floor, and with them hundreds of cockroaches, not one of which escaped.

We now left the house, and went to the chambers, built at a little distance; but these all were in the same state. I next proceeded to open a store-room at the other end of the house, for a place of retreat; but to get the key I had to return to the under room, where the battle was

now hotter than ever; the ants had commenced an attack upon the rats and mice, and, strange as it may appear, they were no match for their apparently insignificant foes. They surrounded them as they had the insect tribe, covered them over, and dragged them off with a celerity and union of strength, that no one who has not watched such a scene can comprehend. I did not see one rat or mouse escape, and I am sure I saw a score carried off during a very short period.

We next tried the kitchen—for the store-room and boy's pantry were already occupied—but the kitchen was equally the field of battle, between rats, mice, cockroaches, and ants killing them. A huckster negro came up selling cakes, and seeing the uproar, and the family and servants standing out in the sun, he said—"Ah, Misses, you have got the blessing of God to-day, and a great blessing it be to get such a cleaning." I think it was about ten when I first observed the ants, and about twelve the battle was formidable; soon after one o'clock the great strife commenced with the rats and mice; and about three the houses were cleared. In a quarter of an hour more the ants began to decamp, and soon not one was to be seen within doors, but the grass round the house was full of them; and they seemed now feasting on the remnant of their prey, which had been left on the road to their nests; and so the feasting continued till about four o'clock, when the blackbirds, who had never been long absent from the calabash and pois deux trees in the neighbourhood, darted down among them, and destroyed by millions those who were too sluggish to make good their retreat. By five o'clock the whole was over; before sun-down the negro houses were cleared in the same way; and they told me they had seen the blackbirds hovering about the almond trees as early as seven in the morning. I never saw these blackbirds before or since, and the negroes assured me that they never were seen but at such times.

A LION.

(From Campbell's "*Letters from Algiers.*")

Our neighbourhood has been occasionally visited by a personage still more consequential than the eagle; namely, the king of the quadruped creation. I had not the honour of seeing his majesty while alive during his last royal progress, but enjoyed the safer gratification of hearing his voice at a distance. This was yesterday evening, whilst I was strolling alone, about a quarter of a mile from the walls of Oran; there was no mistaking the lion's roar, though I had never heard it before but in a menagerie. At first the sound conspired with the savage grandeur of the scene, and the prospect of the long innavigable lakes, to yield me a romantic pleasure. Come, thought I, this is pleasantly

romantic, that I have heard the Lybian lion roar in his native freedom; and as his voice, though I could not be sure from what quarter it came, betokened him to be far off, I stood enjoying my thoughts for a minute as quietly as if I had been reading Longinus. But rapt as I was in the sublime, it occurred to me, that how distant soever his majesty might be, it would be better for me to get into town, than run the millionth part of a chance of being ushered by surprise into the royal presence: so I turned homewards. Presently I came up with two little French soldiers, who were resting on the road side with their muskets beside them. "Gentlemen," I said, "have you heard that lion's roar?" "Oh

yes," they answered, as if they had divined my thoughts; "heard it! he is very near us. You must not think of going alone into town; we were on our way to the block-house, but, for the sake of seeing you safe into town, we will accompany you as far as the gate." "Thank you," I replied; "but I apprehend no danger, and I cannot think of giving you so much trouble." "Pooh! trouble, sir, don't mention that; we must go with you." In short, they were staunch bounds, who, having scented a job, would not give it up, so it was in vain for me to decline their protection. They loaded, or pretended to load, their muskets with ball, and vowed to shed the last drop of their blood in my defence. Much, to be sure, the lion would have cared for us all three! In safety we reached Oran. Near its gate stands an inviting cabaret, and thither my brave protectors threw significant looks. "Gentlemen," I said, taking a franc out of my pocket, "I would give you this bit of acknowledgment for your intrepid convoy, but I must not; for you will lay it out in two litres of brandy, (brandy is sold for ten sous a quart,) which will make you drunk and throw you into a fever." They looked very sulky; "But if you will treat yourselves to wine, it is at your service." "*Eh bien, donc,*" they responded; "*du vin, du vin.*" We entered the cabaret, and I give you my word that the landlord brought them five bottles of not unpalatable red wine, brewed, I believe, from the native grape, for temperance. Of course what vintage can be expected for twopence a bottle? but I tasted it, and really this *boisson*, wholly unlike the alum and logwood-dye liquor sold for wine at Algiers, was tolerable, and I

warrant you my defenders got as brave as lions before they finished it.

I conjecture that when his leonic majesty roared, it was in indignation at some destructive radical natives who were pursuing him, for he was killed a few miles from Oran that same evening; he had killed one camel for his breakfast in the morning, and I have no doubt if he had met with me he would have dined off another. A highland laird once said when he heard it read to him that Job had six thousand camels, "Och! he had too much to do with the camels, you will see that Shob will come to no good." In like manner the lion paid dear for his meal on my namesake; the owner went out with some good marksmen, and next morning I saw the royal corpse in the possession of Gen. Trezel, who had bought it, skin and all, for forty francs. Provoking this! had it been offered to me I would have given one hundred for it. The body measured seven English feet without the tail. All the savans in natural history have agreed that it could not be more than three years old, being lanky, and as maneless as a lioness, though if he had lived he would have been a swinging fellow. His tongue was ate at General Trezel's table, and tasted, I am told, like that of an ox.

It was curious to contrast the youthfulness of this creature with the terror he had spread; the evening that his roar was heard, travellers were seen coming back to town on the roads in all directions, and the hyenas and jackals, who raise their psalmody far and near, omitted their vespers that night, and were as mum as death the two following evenings.

HUNKER, THE MAN-SLAYER.

(From *Walsh's "Constantinople."*)

As I am now about to introduce you personally to Hunker "The Man-slayer," of whom you entertain so fearful an idea, and with such good reason, you would like to know something of his previous history. Mahmood II. is the son of Abdul Hamed Khan. He was born in the year 1788, and is at present the only survivor of fifteen male children; of the females no account is taken, but it is said he had an equal number of sisters. His mother was of French extraction, and was enabled to imbue his mind with more intelligence than is usually found in a Seraglio; but either she had forgotten the language of her ancestors, or did not wish to instruct him in it, for though early acquainted with Persian and Arabic, as well as Turkish, he knows nothing of French or any other European tongue. He was a mere infant at his father's death; and his cousin Selim, as the oldest surviving male heir, was called to the throne according to the law of Turkish succession. This amiable man attempted

to introduce many improvements into the Turkish state; and, among the rest, to create a new force, called Nizam Geddite, disciplined after the European system of tactics. This gave rise to scenes of violence and bloodshed, that for some time distracted the Turkish empire, caused the death of many thousand persons, and ultimately the dethronement of the enlightened but feeble sovereign, who had attempted to effect more than he had energy to accomplish.

Mustapha IV. was called by the victorious Janissaries to supply his place. He was cousin to Selim, and brother to Mahmood. He was a man of cruel, but frivolous character; and the troubles of the former reign were renewed with more violence than before. One of those rude and illiterate, but bold and energetic characters which constantly gain the ascendancy when personal merit alone is the passport to influence and distinction, now appeared among the Turks. His name was Mustapha; he had been a Bairactor,

or standard-bearer, but was raised to the rank of Pasha; and as the Turks delight to retain the name of any humble occupation from which they have raised themselves to distinction, he was still called the Bairactar, and known only by that name, though enjoying the highest rank in the Turkish state. This rough man was passionately attached to the mild Selim; so he collected an army of forty thousand men, and marched to Constantinople. He encamped on the large plain of Daud Pasha, near the city, and waited to take advantage of events. Selim, though deposed, was yet alive in the Seraglio, and the Bairactar's object was to liberate him first and then reinstate him.

It was the custom of Mustapha constantly to engage in some amusement—sailing or fishing on the Bosphorus, or hunting on its shores. He proceeded for this latter purpose to the forests of Belgrade; and the Bairactar determined to take advantage of his absence. He hastened with a strong body of troops to the Seraglio, and hoped to enter without opposition; but an alarm was spread, and he found the entrance closed, and all the pages and inmates armed for a determined resistance. He thundered at the gates, and demanded, in his fierce energetic tone, that Selim should be restored to liberty, and as no reply was made, he proceeded to force them. At this critical moment, Mustapha, who was apprized of what was attempted, landed from the Bosphorus, and entered the gardens of the Seraglio at one side, while the revolutionists were getting in at the other. Seeing the state of things, he gave his directions on the emergency of the occasion. Some eunuchs instantly sought out Selim, and they found him in an interior apartment in prayer, as was his daily custom at the hour of the Namaz. In that position they threw themselves upon him. He made a vigorous defence, and for some time struggled powerfully with his assassins; but one of them twining himself about his knees, and seizing him in such a way as to give him exquisite pain, he was rendered powerless, and sunk under the agony: in that state he was strangled as he lay on the ground. The gates were then thrown open, and, by the direction of Mustapha, the body was brought out to the Bairactar, who was informed that he was the person he demanded. The rough soldier threw himself on the remains of his gentle master, and wept bitterly.

Meantime the eunuchs proceeded to the apartment of Mahmood, to execute upon him a similar death; but he was no where to be found. It appeared that a slave, much attached to his person, had hurried him off on the first attempt to burst open the gates, and had concealed him in the furnace of a bath. From hence he was taken by the party of the Bairactar, who, having deposed his brother Mustapha, in their indignation at the fate of their favourite, placed Mah-

mood on the throne on the same day, 28th of July, 1808. The deposed monarch disappeared; and it is said the first act of his brother on his elevation was to have him strangled. This fratricide, so common in Turkish history, is deemed so necessary a policy, that the people annex no moral turpitude to such murders in the Seraglio. The first act of his great ancestor, Mahomet II., on his elevation to the throne, was to strangle or smother all his younger brothers. There were other murders, however, said to be committed at the time, which, though they are not without precedent, are in their own nature so repugnant to the feelings of humanity, that I am unwilling to detail things which you and others will reject as altogether incredible. The transactions of a Seraglio are so involved in obscurity, and the waste of human life so common, that events which pass there are often unknown or unnoticed by the Turks themselves, and only transpire through the more active curiosity of the Franks.

It is deemed an act of high criminality for the son or brother of a deceased or deposed Sultan even to look upon the females of the harem of the man he succeeds; they are therefore always removed to another residence. There is a second Seraglio, called Eski Serai, or Old Palace, built by Mahomet II. for this purpose. It occupies an area of about one mile in circumference, in the middle of the city, and is surrounded by a high wall. To this enclosure all the females of a former Sultan are sent, with the Sultanas who have had children, and there generally are about one thousand women of this description residing there. There are funds allotted for their support, and the gates are carefully guarded by eunuchs, whom I have seen with drawn sabres, when the door has accidentally opened as I passed by.

On the death of Mustapha, this harem was to be removed to make way for that of his brother. The time for such a thing is usually very early in the day, that females may pass through the streets when no one is abroad. Before grey dawn one morning they were all prepared, and issued from the garden-gate of the Seraglio on the water. Here they were received on board a number of large caiques in waiting; and, instead of proceeding to the Eski Serai, they were rowed across towards the Prince's Islands, just opposite, in the Sea of Marmora, about thirteen or fourteen miles distant. They were then thrown into the sea. The greater number submitted to their inevitable destiny without a struggle—were passively placed in what was called their canvass coffins, and committed silently to the deep; a few, however, frantic with terror, made a strong resistance, and their shrieks, at that still and early hour in the morning, were distinctly heard on the islands. I could not learn exactly how many were sacrificed, and I have heard several different accounts, which varied both in the cir-

cumstances and the number of persons, but it was generally reported that the young Sultan had thus disposed of the whole or the greater part of his predecessor's female establishment, to the frightful amount of two or three hundred persons. You will naturally ask what possible cause there could be for this gratuitous waste of human lives, so harmless, and so little to be feared. The mysteries of the harem never transpire; but it was understood that they were charged with having been accessory to the death of Selim. They were the only persons present with the eunuchs who perpetrated the murder; and it was assumed as a proof of their guilt that they did not prevent it. The real cause of their death, however, was supposed to be, that some of them were pregnant; and the whole were cut off, that no possible chance might be left for the existence of a child of the brother of the reigning sovereign. In the three revolutions which took place at that time in eighteen months, two Sultans and about thirty thousand men were destroyed in the city; the death of two or three hundred women in such a scene of carnage was a thing too trifling and contemptible for a Turk to waste a thought on.

Immediately after ascending the throne, Mahmood gave proofs of that energy which has since distinguished him. The Russian war had been carried on with but feeble effort. The armies of the Emperor had driven the Turks before them out of the provinces, and followed them across the Danube, and the Grand Vizir was compelled to retreat beyond the Balcan, and take up a position at Adrianople, leaving nothing to obstruct the march of the enemy on the capital, but a garrison in Shumla and the Balcan mountains, which they were preparing to pass. At this critical moment the young Sultan erected the standard of Mahomet, at Daud Pasha, and issued a hatta sherif, that all Musselmens should rally round it. The spirit of the monarch seemed infused into the people. Two hundred thousand men were suddenly raised, a new Vizir was appointed, who partook of his master's energies, and the Russians, instead of passing the Balcan as was expected, were compelled to recross the Danube, and the peace of 1812 put an end to hostilities. Since that time the Turkish empire remained in a state of tranquillity, till the Greek insurrection burst out, and again called forth the terrible energies of the sovereign.

The character he has acquired is that of a man of extraordinary activity of mind, and uncompromising severity of temper. He is represented by Andreossi, who knew him well, as a person of uncommon talents, and who, though he appoints nominal ministers, actually governs by himself; and such is his sagacity and sources of information, that he knows what is going on better than any man in his empire, and is always able to anticipate his Vizir's reports. It is well known that

he goes about the streets at night in disguise, like Haroun Alraschid, entering coffee-houses, mixing with all ranks, and hearing their opinions. People have assured me that they have recognised him on these occasions, but dared not intimate the slightest notice of it. His situation gives him a certain sense of security which few of his predecessors had. He is the last existing descendant of Mahomet fit to govern. He has two surviving sons, one about the age of six, and the other an infant; and his enemies report that it is his horrible intention to destroy them whenever they arrive at the age fit to govern, in order to secure the throne to himself as long as he lives.

Notwithstanding this, he has shown, on occasions of his son's illness, considerable anxiety. The boy was once afflicted with the jaundice, and a Frank physician, on whose skill his father had more reliance than on the hakims of the country, was called in to see him. He told me he found the young patient in an apartment lined with yellow silk, which cast such a glare that the discolouration of the boy's skin could not be noticed. The attendants informed him it was done in order to conceal the effects of the disease from his anxious father. He is not a man of cruel disposition in his own family. On the contrary, he has several daughters by different mothers, to whom he is affectionately attached; and his ordinary intercourse in private life is urbane and affable. His knowledge of the Oriental languages is considerable. He writes Persian and Arabic with elegance and purity, and all his hatta sherifs are his own composition, and distinguished by their terseness and precision.

The Sultan affects a high regard for decorum and public morals. Every day firmans are issued and cried about the streets against indecorous actions. I have heard one man denounce the shortness of women's petticoats, as exposing too much of their legs, though I never saw one whose garments did not nearly trail on the ground; another the practice of females looking out at windows. There is a kind of close balcony in Oriental houses, called Shanassie, which generally looks up and down a street, and a figure is sometimes seen indistinctly through the dense lattice-work; but even this indulgence he strictly prohibited. On some more serious occasions, however, he gives fearful indications of his anger. There was a coffee-house at one of the gates of Galata, which commanded a fine view of the Bosphorus, and here Turks of respectable rank used to resort. One day the son of an Armenian merchant was proceeding to his father's office in Galata, and as he passed by was invited in by the Turks, who gave him some sweetmeats, but treated him in such a way before he departed, that the boy complained to his father, who immediately proceeded to the Seraglio, and laid his

complaint before the Sultan. His anger blazed out with great fury; he sent over some chouashes on the instant, who found the Turks still in the coffee-house. They were strangled on the spot, and the house pulled down over them,

as if to hide them in the ruins. I had often occasion to pass this, which was not suffered for some time to be rebuilt, and the janissary who accompanied me always pointed out the ruins, and told me the story.

IS MAN A MERE ANIMAL?

SECOND ARTICLE.

WE have already put this question, in the second number of the Miscellany, at page 20; but it is a very important question, and one which requires to be put again and again, before the answer to it can be rightly and fully understood.

It is desirable, nay, we may say it is absolutely necessary, to reiterate the grounds of the importance of this question, and the reasons why men are apt to have doubt, and even fall into very serious errors, respecting it; because, when these are fully understood, and duly borne in mind, the truth is more than half established.

First, then, as to the importance of the question: It is the grand question of immortality, whether the whole of man moulders in the dust, and the whole substance of which he is composed is delivered up to the store of dead matter, in the same manner as the body of a plant, or of one of the irrational animals; or whether there is in man an immortal part, over which death, in the material sense of the word, has no power; but which shall live, and know, and enjoy, through ages of eternal duration. If the answer is taken in the first of these terms, it instantly lays the axe to the root of all religion, all moral principle and responsibility—every thing, in short, that is amiable or valuable in man—and throws him upon the gratification of his mere bodily appetites, as his only portion and his only hope; in homely but appropriate phrase, it makes him a beast, and the most imperfect, consequently the most wretched, of all beasts,—the blot of creation, and not the beauty.

It goes further than this; for if man is a mere animal, then creation is imperfect, and cannot be the work of a Being of infinite wisdom and goodness. If the premises here are admitted, the conclusion is irresistible. If it be true that man is a mere animal,—that “there is no God” is also absolutely and necessarily true. The system of nature would not harmonize with an all-perfect God; and an imperfect God is no God at all. This is the importance of the question, and it needs no amplification—cannot be amplified.

Secondly, as to the difficulty. The doctrine of immortality is not a discovery which the unaided powers of man can perfect: it is a doctrine of revelation, and could not have been known by any other means. “Life and immortality are

brought to light by the Gospel,” and by the Gospel alone. Some of the ancient philosophers had dreams upon the subject; but these were mere “longings after immortality,” and not the established belief of its truth. When we analyze them, we find that they rather tend to show that the caricatures of human nature which compose the Pantheon are not gods, than give any information as to the nature of the true God.

Even the volume of inspiration in the time of the Jews, and up to the coming and ministry of Christ, did not afford the elements of a well-grounded belief in the immortality of the soul. There were the prophecies, no doubt; but these were incomplete without the fulfilment. It is the knowledge of God as the Creator, the Governor, and the Saviour, which is the key, and the only key, to the grand doctrine of immortality. But God, under the law, declared himself as the God of the law, not as the God of grace; which last perfects the character to our comprehension; and therefore none but an inspired man could have a proper knowledge of God under the law, and even he only in the moments of his inspiration.

Under the Jewish dispensation, indeed, the conclusion to which a philosophical mind must have come, is not very different from that to which the denying of the immortality of the soul so clearly and so necessarily leads; and it could not be different, as the element which gives us the perfect view of the character of God was equally wanting. The Jews were taken under God's especial protection, laws were promulgated, and inspired men were called forth to instruct, and lead, and guide them. But, notwithstanding this, they were in a state of almost continual rebellion against God; and, in defiance of all that was done for them, they were constantly falling into the most gross and debasing idolatries.

This could not be the government of an all-wise and all-powerful being; for men, in their own strength, could break from under it. The revelation to the Jews was that of some of the attributes, namely, those attributes with which man would have to deal if there were no Saviour; but it was not the revelation of a perfect God. Man was thus still an anomaly; and the only difference appears to be, that, in considering man as a mere animal, he is a physical anomaly; and in considering him as the children of Israel were,

under the legal dispensation, he was a moral anomaly. This shifting from physical to moral does not, however, in the least tend to remove the anomaly, or to bar the conclusion to which that anomaly leads. If proof of this were wanted, we have it abundantly in the history of the Jews, as recorded in the sacred volume. Inspired men, in their inspired moments, may, as we have said, have had prophetic glimpses of the true God; but the Jews, as a nation, could not possibly have had this knowledge, for had they known the true God as such, they could not so habitually have departed from him, to serve the idols of the nations around them. The whole of the legal dispensation is one unbroken demonstration that, "by the deeds of the law, there shall no flesh be justified" in the sight of God; and of man's "being justified freely by his grace, through the redemption that is in Christ Jesus."

But there are difficulties in the proper understanding of this momentous question of immortality, even under the Gospel dispensation. Those who are born in a Christian country, though they are born with high privileges, are no more born to Christianity as a heritage, than if they were born in the darkest night of idolatry. Not only this; for, upon the most charitable judgment that we can form, many of them grow up, and acquire natural, and practical, and social knowledge, and accumulate wealth, and are esteemed in their day, and yet pass through life, and go down to their graves, in utter ignorance of all the doctrines of Christianity; nay, it is probable, certain, that some such are regular attendants upon the ordinances of that church to which they attach themselves, and yet one ray of the light which shines from Heaven has never fallen upon their understandings.

The study of nature has been mightily improved since Christianity has been made to bear upon it; but still, notwithstanding all its improvements, it never will, and never can, become Christianity. The conclusions to which it leads will necessarily harmonize more and more with the doctrines of Christianity, as they approximate nearer and nearer to the truth; but as the one is material and the other spiritual, they never can become convertible, and mankind will never be able to arrive at the knowledge of "eternal life" without the aid of the Gospel.

This is, in fact, the great difficulty which besets the question. Physical man, organized in a peculiar manner, possessing organs of sense and senses, and being born and dying like the other animals, is man, as presented to the senses in ordinary observation; and in so far as this observation and the conclusions to which it leads are concerned, there really is no more. Then, when we look round and compare man with the other productions of nature, we find that there is a definite place and office for each and all of the others, but that there is really none for him.

There is not another living animal of which we cannot point out the proper place in wild nature; and by a careful induction of particulars, we can form very shrewd guesses at the proper localities of those extinct races of which the remains are found in the earth, even though these remains should amount only to a bone or two; but we cannot lay our finger upon any one spot in the map and say, "Here is the proper locality of man," in which he could live in a state of nature, without the smallest assistance of art.

It is true, that man gets the art in time, and no race has ever been found that had not some beginning of it, although this art, even in its humblest state, is very different from the action of any other animal; yet still there are very great differences in the actions of those animals; and this occasions a tendency to confound their differences with the difference between them and man. Besides, the physical operations and results of the arts are all that present themselves to the senses; and as we have said, and as must be self-evident to any one who thinks on it, there can be no spiritual conclusion drawn from physical premises.

Man is, therefore, at his birth, in the most enlightened country, and at the present time, as ignorant of the doctrine of immortality as he could be under any circumstances; and though he climb to the very pinnacle of physical science, survey all the productions of nature, and see all the foundations of all the arts, there is nothing in them that can in the least assist him on the doctrine of his own immortality, though that is the doctrine of the most vital and overwhelming importance.

Even if he takes it for granted, the belief which is not based on the force of Gospel truth, is therefore a tacit belief, which lasts only as long as it is not disturbed, then he cannot grapple with the principles of physical nature without the greatest peril, because the apparent fact of man's being an anomalous and imperfect creature will arise, and bring with it the fearful and withering train of scepticism to which we have already alluded.

What, then, is to be done, in order that man may study the works of nature in such a way as to confirm his belief in the immortality of his own soul, and in the existence and attributes of the true God? The answer to this is as clear as a sunbeam: He must go to the volume of inspiration, and inform himself well of the character of the Godhead as there set forth. It is given by the Great Being himself, and given to all mankind, learned or unlearned. Therefore if he use the means in the proper manner, and with the proper supplication for assistance, he cannot fail. He must inform himself of the perfection and purity of the Divine law, which admits not of the slightest deviation; he must take note that a finite creature, acting upon the judgment of its own limited reason, and the analogy of its

own limited and imperfect experience, could not, cannot, in the very nature of things, keep this pure, perfect, and holy law. He is to understand that man erred and fell, not of God's special predestination, but of his own nature, in which this kind of fall was involved, just as a fall of another kind is involved in the very nature of a stone or a piece of lead, when it is left without support in the atmosphere. Having fully understood this, he is to turn his attention to the utter impossibility of fallen man regaining that state from which he has fallen. And this is a very clear and obvious matter; for if it is once demonstrated that man, in his own strength, could not keep the law of God, there needs no argument to prove that he could not, and cannot do more than keep it. This is that which leads man

directly to the cross of Christ, to the humbling of his natural pride, no doubt, but still not, on that account, the less to his advantage. The utter impossibility of man, in his own strength, regaining that state of purity which he was in at his first creation, or of keeping it if he could regain it, is one of the most important points in this part of the subject.

When the identity of the God of nature and the God of grace is thus fully established, and man sees the harmony between the doctrines of the Gospel and the condition of nature around him, the doctrine of immortality becomes a plain and easy doctrine; but it is one upon which contemplation should love to dwell, and therefore we shall make it the subject of yet another short paper.

POETICAL REMAINS OF A STUDENT.

SELECTION THE SECOND.

HOPE.

THOU seemest as a vesper-star,
Sweet Hope! to him whose day is fading,
And shinest like a beacon far,
When night the wind-chafed waves is shading:
How sweet such twilight moments are
When thou art by, when thou art aiding!
O sink not yet, sweet star! not yet
Withdraw thy beam, thou beacon-blaze!
Fall well I ween the sun is set
That crown'd with light my childhood days;
And wilt thou vanish, now regret
Wespe, as she eyes those lingering rays?

STANZAS.

SHE drooped as droops the lotus flower
When summer eyes are dim,
And softly swells from minster-tower
The holy vesper-hymn.
Strayed there a wild bee o'er its breast,
A gale across the stream,
To scar its fair, transparent vest,
Or mar its mystic dream?
The wild bee wandered not, the gale
Slept on the dimpling wall,
And none beheld how purely pale
Those dew-bent clusters fell.
As beautifully wan, as meek,
As silently declining,—
She drooped; for whom these eyes are weak,
This woe-worn heart repining.
No burst of sorrow rent the link
Uniting soul with clay;
Like lotus flower from river's brink,
Her semblance passed away.

THE CAPTIVE.

WAKE not the waters with thine oar,
My gentle gondolier;
The whispers of the wave and shore
Still linger on my ear.
Lonely the night, and dark its sleep,
And few the stars that glow
Within the mirror of the deep
That lies outspread below.

But fix the mast, the sail unfurl,
My gentle gondolier;
The wind is soft, the calm waves curl,
The sentry cannot hear.
And in this light our little sail
May well escape his ken;
And we shall meet, ere dawning pale,
Our long-lost countrymen.

Long years the iron manacle,
My gentle gondolier,
Hath worn these limbs in death-damp cell,
Till they are stiff and sere.
Yet little heed I strengthless limb,
Or think of anguish past,
So we escape while night is dim,
And heaven is overcast.

"Hark! 'tis the wakeful sentry's call!"
Nay, nay, my gondolier,
We're far from castle-moat and wall,
The sentry cannot hear.
'Tis but the plunging sea-dog's feat,
Or wild bird on the cliff;
And, lo! the wind is in our sheet,
More swiftly sails our skiff.

More swiftly, and more swiftly yet,
My gentle gondolier;
The gale is fresh, our sail is set,
And morn will soon be here.
O ne'er did hope so ardently
In human heart expand,
As mine, to see thee ere I die,
My own, my own loved land!

DIRGE.

SWEET be thy slumbers, child of woe!
At the yew-tree's foot, by the fountain's flow!—
May the firstling primrose blow,
Pallid snow-drop bloom;
And the blue-eyed violet grow
By thy lonely tomb!

Duly there, at close of day,
Let woman's tears bedew the clay!
There let wren and ruddock stray,
And dark ivy creep—
Mixed with fern and mosses grey,
O'er thy last long sleep!

REVIEW.

WORKS OF THE REV. JOHN HARRIS.

A little more than a year ago Mr. Harris was scarcely known beyond the circle of friendship and of pastoral duty in the seclusion of Epsom. All at once he has risen to unprecedented celebrity. The annals of our literature scarcely furnish an instance of similar success; seldom does merit so soon find its reward, and even the minion of fortune, borne upwards by caprice, fashion, or party, whom a breath creates and a breath destroys, has never been inflated into a bubble in so brief a space of time.

Great talents are often destined to force their way through a host of difficulties; and in some instances, unable to maintain the unequal conflict, their possessor has sunk beneath its pressure. Chilling neglect, and persecution in the form of criticism, has frequently proved too much for the sensitive temperament of conscious genius, and while the nerves have been shattered, the mind, as to all vigorous and effectual effort, has been paralyzed. It has been said, indeed, that the highest intellectual powers will create favourable circumstances, or overcome the most adverse—and this may be true; but certain it is, that not a few of our most successful writers are indebted for the development of their talents, and their consequent celebrity, to a happy coincidence of circumstances, which they could not have foreseen, and over which they could have had no control.

How long the authors of the "Rejected Addresses" would have remained in obscurity it is impossible to imagine, if at last some biblioplist, more sagacious and more adventurous than his brethren, had not courageously taken the risk of a publication, which he regarded as a thing of dubious merit, and therefore of uncertain success.

It was the lot of Mr. Harris, in offering his first work to the trade, to encounter a similar reception. He was unknown, and could present no credentials of his merit. There were, it is true, his own modest, unassuming manners—his timidity, dreading, and yet almost asking for a repulse—his bulky manuscript, with its perplexing and not very attractive title—we need not add that these were not very strong recommendations to men who regarded the whole simply as a matter of pounds, shillings, and pence, and who always, and strangely enough conclude, that though there must be a succession of authors, yet that every new aspirant is either a presumptuous charlatan, or a mere beggar in disguise. There is something radically defective in the system of introducing authors and their works to the public; what it is, and how it is to be remedied, we are not prepared to suggest; yet we are persuaded that "full many a gem of purest ray serene," wrapt up in mystic scroll, is deposited among the ill-sorted lumber in that limbo of neglected talents—the desk, of what is called, "the Reader,"—that is, the bookseller's fag, or factotum, as the case may be.

A great deal of trash is published; and we may fairly conclude, that much more is considerably withheld. But as we are indebted to accident and not to the judgment of our modern Mæcenases for some of our best and most popular works, we cannot but fear that many equally instructive are kept in abeyance, while their authors are wasted with anxiety, or pining under that delay of hope which makes the heart sick. Mr. Harris found a publisher: his "Great Teacher" made its appearance, and there were a few who were not slow to discover its singular merit; it was however so unlike the theological publications of the day in the style, in the manner of treating the subject, and in the

variety, beauty, and often sublimity of the illustrations, that those who were best able to appreciate it, felt that its progress could not be rapid, because it would be some time before religious readers, or those who read scarcely any other than religious works, could be reconciled to a train of thinking, and a class of subjects so much out of their usual sphere of thought, and as a composition so far above their average literary tastes and attainments. It is precisely one of those books which if they do not, after the perusal of a few pages, take fast hold of the mind, are laid aside as heavy or uninteresting. The long preface, too, in the first edition, in which were introduced, but scarcely discussed, topics which of themselves required a treatise, had the effect of deterring superficial readers from sitting down and mastering its great argument. We are of opinion, however, that if no adventitious circumstances had occurred to render it an object of curiosity to multitudes who now read it with avidity, and recommend it to their friends, it would have silently advanced in public estimation, and have taken ultimately that station in our evangelical and ethical divinity to which it has been so suddenly raised by the unprecedented success of "Mammon," a work which had an interest created in its favour long before its publication; which started from the press as an intellectual giant, after obtaining the victory over a hundred and fifty competitors; which amply justified the award of the adjudicators (in every respect as competent for the task as any two men that could have been chosen) the Hon. and Rev. Baptist Noel, and the Rev. John Pye Smith, D.D. Our readers are all aware that "Mammon" is a prize essay; that Mr. Harris is its author; and that in little more than eight months its sale has amounted to 19,000 copies. This interesting, and most seasonable, as well as most able production, though for the most part justly treated by the Reviewers, has drawn upon itself peculiar scrutiny; and its claims to be the thing it is, have been severely tested both by friends and enemies.

Mr. Harris, too, has been the successful candidate in another prize race; and as in each case the writers were unknown to the arbitrators, this second adjudication must satisfy every man, that whatever be the distinguishing characteristics of Mr. Harris's writings, that they must be of a very superior order. If we, who have read them in the discharge of our official duties, were called upon to state in what we conceive this superiority to consist, we should not fix upon any one prominent quality, but we should say, to the industry that accumulates from all their varied sources the materials necessary for the full understanding and proper construction of his work, Mr. Harris unites a perfect mastery of the subject; his mind grasps it in all its bearings; and the materials he has brought together, become homogeneous and proportional in his plastic hand. He appears to us to write as though the finest thoughts, in the most captivating forms, and clothed in vestments corresponding with their dignity and beauty, like so many celestial visitants, had charmed his vision while he transferred their types and resemblances to paper. But superior as Mr. Harris's productions are in a literary point of view, this alone would not have raised him to the eminence on which he stands. The churches of Great Britain, or, more properly, the genuine Christians in all our several communities, are placed, by the events of the last few years, in a situation more commanding and more influential, as it regards the diffusion of Christianity, than at any former period,—a situation, at the same

time, requiring from them all a combination of energies, a unity of interests, a generous consecration of property, and, above all, a degree of spiritual self-devotement, and entire and simple dependence upon Divine agency and influence, that shall emulate, if not exceed, the same high qualities as developed in the spirit and the efforts of apostolic time. Of this, many devout and zealous individuals felt the most powerful conviction; and they felt, too, that the public Christian mind was far, very far, behind what its avowed principles and professions, viewed in connexion with its accumulating responsibilities, imperiously demanded. Mr. Harris was one of these, and seems to have been selected by Providence as the honoured instrument to commence the work of reformation; and this is the great secret of his undisputed reputation as an author. In proof of this position—and it is only a single leaf from a volume that breathes throughout the same feelings and aspirations—we quote the following from the "Great Teacher":—

"The church itself requires conversion. We pray for the conversion of the world; but the church itself, though in another, yet in a sober and substantial sense, needs a similar blessing. The object of conversion is two-fold—personal and relative, to bless us, and to make us blessings. Individual conversion accomplishes the first object by placing us in a personal and evangelical relation to Christ; the second can only be scripturally effected by the collection and organisation of those who are so related to Christ into a church, and by that church advancing forwards, and placing itself in an evangelical relation to the Holy Spirit. Now, the prevailing sin of Christians is, that they are inclined to stop short at the first of these stages. They are, perhaps, sufficiently alive to the importance of preaching Christ as the author of redemption, for they have their own personal experience in evidence of its necessity; but they are not proportionally alive to the necessity of Divine influence as the means of usefulness, for of that they have not the same evidence. Their conversion to Christ, as individuals, was scarcely more necessary to answer the first aim of the Gospel, in their own salvation, than their conversion to the Spirit, in their collective capacity, is necessary to answer the second, in the salvation of others. I say their conversion to the Spirit; for the change necessary has all the characteristics of conversion,—conviction of guilt in neglecting his agency, a perception of his necessity and suitableness, and earnest applications for his heavenly influence.

"That the doctrine of Divine influence has a place in the creed of the faithful, we admit; but it is one thing to assent to its truth and importance, and a very different thing to have a deep and practical persuasion of it. That the Holy Spirit is at present imparted to the church, to a certain degree, is evident from its existence; for every believer is the production of the Spirit, carries about in his own person signatures and proofs of divine operations, and thus forms an epitome and pledge of the eventual conversion of the world. But as to the measure in which his Divine influence is afforded, who has not deplored its scantiness! From the earliest dawn of the Reformation to the present hour, this has been the great burden of the church. What writer, of even ordinary piety, has not bewailed and recorded it as the standing reproach and grief of his day? Look back, and what do we behold? a procession of mourners,—nearly all the living and eminent piety of the time,—dressed in penitential sackcloth, moving through the cemetery of the church as through a Golgotha, and exclaiming, in tears, 'Come from the four winds, O breath, and breathe upon these slain, that they may live.' What do we behold? 'the priests, the ministers of the Lord, sanctifying a fast, calling a solemn assembly,' lamenting that so few attend the solemn call, and then advancing,—a mournful train,—casting themselves down, and lying prostrate at the foot of the throne of grace, and, as the representatives of the church, exclaiming, 'Behold, O Lord, a poor company of creatures gasping for life! Thy Spirit is vital breath; we are ready to die if thy Spirit breathe not. Pity thine own offspring, thou Father of mercies. Take from us, keep from us what thou wilt, but oh! withhold not thine own Spirit.' Such were the actual terms in which the great and pious Howe led the supplications of a solemn assembly, in his day, convened to cry for the Spirit. And has it not been on the lips of the mourners of Zion—an unbroken procession, ever since? And does it not express the sense of the church in the present day? As we have fallen into the train, and brought up the rear, of the mourning suppliants, have we not deplored the absence of the Spirit as the great affliction of the church, and implored his impartation as our great want, our only remedy?

"But 'the Spirit will be poured out from on high;'—would that the importunity and loud cries of the church warranted the expectation that the event was near! And when he does descend, among the many blessed effects which will accrue, this, doubtless, will be one,—that the teaching of Christ concerning him, will be hailed and studied as a new revelation, will be traversed and explored like a newly-discovered continent. The reasons of Christ for amplifying the subject, and for laying so

much stress upon it, will then be felt in the inmost soul; each of his declarations concerning it will seem to expand into a page, and be consulted as a charter fresh from heaven; promises which we now repeat with freezing accents will then burn on our lips, and be pleaded with an earnestness not to be denied, but which will open the windows of heaven for the emission of still larger outpourings of the Spirit."—(Pp. 172-174.)

This is conclusive to our point; but it is in "Mammon" that the reprove and the instructor, the Christian and the divine, more conspicuously unveil themselves. Covetousness, in what it withholds of actual and necessary contributions towards the advancement of the kingdom of Christ, and as it is a spirit withering to the power of Christian principle in the heart, turning a religion of mercy into an aliment of selfishness, is an evil that has scarcely its parallel in the whole catalogue of vices; and if it has prevailed to any great degree in the Christian church, the wonder is not that that church is in so low a condition, but that it exists;—not that it has advanced so little upon the paganism of the world, but that the world has not completed its annihilation. Its Divine Head, by counteracting energies vouchsafed to the faithful few, has maintained her life, notwithstanding the wide-spreading desolations of Mammon; and we believe, at least we hope, that now that the charge has been formally brought against the Christian church,—not against any particular section or division, but against the collective church; and not only brought, but pressed home to every man's conscience, with an evidence and earnestness it is impossible to gainsay or to resist,—that a new era will commence, and that, in rooting out this worst principle of selfishness from the bosom of a community that professes to cherish only love and benevolence, that community may breathe again the divine spirit of its blessed Founder, and, receiving unmeasurable communications of grace and power from his throne, may soon rise in its majesty and might, not only to dazzle, but to vanquish all its foes: "fair as the moon, bright as the sun, and terrible as an army with banners."

We must transfer to our pages a powerful and affecting passage; let it be placed among our gems, and let every reader who is covetous of such treasures as these go to the mine itself; that is, if he has not done so, let him procure the work.

"One of the great objects of the personal ministry of our Lord himself, appears to have been to make us aware of the universality of this passion, and to save us from it. Sin having expelled the love of God from the heart, he saw that the love of the world had rushed in to fill up the vacuum; that the desire of riches, as an abstract of all other worldly desires, has become a universal passion, in which all other appetites and passions concur, since it is the readiest means to gratify them all. To the eye of an ordinary observer, the generation of that day appeared to be only laudably employed in their respective avocations; but, penetrating the thin disguises of custom, he beheld the world converted into a mart, in which every thing was exposed for sale. To a common observer, the confused pursuits and complicated passions of mankind might have presented an aspect of ever-shifting forms, as incapable of classification as the waves of the sea; but to his comprehensive view there appeared but two great classes, in which all minor distinctions were merged,—the servants of God, and the servants of Mammon. To his unerring and omniscient glance, the whole world appeared to be engrossed in a laborious experiment to effect a compromise between these two claimants: but against such an accommodation he enters his divine protest, affirming, with the solemnity and confidence of one who knew that, though the experiment had been made and repeated in every form and in every age, it had failed as often as it had been made, and will prove eternally impracticable, 'Ye cannot serve God and Mammon.' To an ordinary observer, the charge of covetousness could only be alleged against a few individuals; but he tracked it through the most unsuspected windings, laid open some of its most concealed operations, and showed that, like the elemental fire, it is not only present where it is grossly visible, but that it is all-pervading, and co-extensive with human depravity.

"Entering the mart of the busy world, where nothing is heard but the monotonous hum of the traders in vanity, he lifts up his voice like the trump of God, and seeks to break the spell which infatuates them, while he exclaims, 'What shall it profit a man, if he gain the whole world and lose his own soul? or what shall a man give in exchange for his soul?' Proceeding

to the mansion of Dives, he shows selfishness there clothed in purple and fine linen, and faring sumptuously every day,—a spectacle at which the multitude stands in earnest and admiring gaze, as if it drew in happiness at the sight; but Lazarus, unheeded, perishes at the gate. Approaching the house of prosperity, he bids us listen to the soliloquy of its worldly inhabitant, 'I will pull down my barns, and will build greater,'—a resolution which the world applauds,—and I will say to my soul, Soul, thou hast much goods laid up for many years; take thine ease, eat, drink, and be merry.'—a prospect of happiness which the world envies. But God is not in all his thoughts; besides his wealth, he knows no god. Passing into the circle of devotion, he pointed out the principle of covetousness there, mingling in the worship of God, choking the word, and rendering it unfruitful. Penetrating the heart, he unveiled its hateful presence there, as the leaven of hypocrisy, and the seed of theft.

"And can we wonder at the energy and frequency with which he denounced it, when we remember how frequently it came into direct personal contact with himself, defeating his tenderest solitudes, and robbing him of souls he yearned to save? It was covetousness which rendered unfruitful so large a proportion of that heavenly seed which he had come to sow. It was this which begrudged him the anointing for his burial. It was this which robbed his kingdom of a subject just at the moment when 'the young man' appeared to be about to fall into his train; and which drew from him the affecting exclamation, 'How hardly shall they that have riches enter into the kingdom of heaven!' This it was which left the gospel-feast so thinly attended, and which sent excuses instead of guests. His audience commonly consisted of 'the Pharisees who were covetous, and derided him.' Wherever he looked he beheld the principle in active, manifold, ruinous operation, 'devouring widows' houses,' 'drinking orphans' tears, luxuriating in the spoils of defenceless childhood and innocence. Did he turn from this sickening spectacle and seek relief in the temple? there he beheld nothing but a den of thieves. Mammon was there enshrined; the solemn passover itself turned into gain; the priests trafficking in the blood of human souls. Like their forefathers, 'from the least of them even unto the greatest of them, every one was given to covetousness.'

"But the last triumph of covetousness remained yet to be achieved. To have sold the temple for money would have been an act of daring impiety; to make it a place of merchandise was, perhaps, still worse, it was adding sacrilege to impiety. Only one deed more remained to be perpetrated, and covetousness might then rest satisfied. There was one greater than the temple. God so loved the world that he sent his only begotten Son to redeem it—might not he be sold? Covetousness, in the person of Judas, looked on him, eyed him apace, and went to the traffickers in blood, and, for the charm of thirty pieces of silver, betrayed him,—a type of the manner in which the cause of mercy would be betrayed in every succeeding age. Yes, in the conduct of Judas—the incarnation of cupidity—towards Jesus Christ—the incarnation of benevolence—we may behold an intimation of the quarter from which, in all succeeding times, the greatest danger would arise to the cause of Christ. The scene of the Saviour's betrayal for money was an affecting rehearsal, a prophetic warning, of the treatment which his Gospel might expect to the end of the world."—(Pp. 71-76.)

But the "Christian Citizen,"—its history is sooner told than its excellencies described, or its splendid faults so discriminated, that no more censure should fall upon them than in strictness they deserve. To us, however, critics as we are, we acknowledge we would rather have the faults, which are mere exuberances of a richly-furnished mind and a luxuriant imagination,—than that the thought, or the style, or the euphony, should in the slightest degree be impaired. For our parts, we have no taste for faultless monstrosities; and what would become of our self-love, should we ever be so unfortunate as to read a work in which fastidiousness itself should not be able to detect a blemish?

At the solicitation of the committee of a society denominated "The City Mission," this sermon was delivered by Mr. Harris, at the Poultry chapel, in aid of the funds of the institution. It was addressed to a crowded and deeply-affected audience; and in compliance with the public will, unequivocally expressed, Mr. Harris was induced to send it forth from the press. The object of this sermon is to rouse the attention of Christians to the moral and religious state of the metropolis; and the disclosures which it makes are truly appalling, and reflect utter disgrace, not only upon "the poor man's church,"—which has for centuries left millions of the poor to perish, and which, in London alone, has abandoned eight hundred thousand human beings to all the crimes and miseries induced

by neglect and ignorance,—but on all churches, especially those that profess, in the spirit of Christ, not merely to keep up existing institutions, but to go forth to "seek and to save that which is lost." We give Mr. Harris's statement in his own touching and impressive words:—

"One of the most affecting pages in the book of the world, is that which presents to the eye of the Christian a tabular view of its religious state. If we suppose, according to the usual estimate, that the inhabitants of the world amount to 800,000,000, then the whole, in round numbers, may be thus divided:—Pagans, 482,000,000; Christians, 175,000,000; Jews and Mahometans, 143,000,000. O what shame should cover the Christian church, that such should be the state of the world—of Christ's world—eighteen hundred years after he has died for its redemption! More than three-fourths of the human race in ignorance of him, or in avowed alienation from him! But there is a fact, which should be felt by every Christian inhabitant of this great city, more deeply still—the fact that the religious condition of London forms a striking epitome of the religious condition of the world. Divide its 1,500,000 inhabitants—as we have just divided the population of the world—into three classes; let these be, the openly irreligious; the occasional and worldly attendants on the ordinances of religion; and the regular worshippers of God. Let the first class stand for the Pagan, and the second for the Jewish and Mahometan, and the third for the Christian division of the world,—and you will find that the proportion which they respectively bear to the whole population of London, is about the same which those three great divisions respectively bear to the whole population of the world.

"For example, is more than one half the species Pagan? A distinguished metropolitan clergyman calculates the number of the lower classes who are living in London in utter disregard of all religion as half a million at the very least. 'But,' says a later writer, 'my impression is that the number is nearer 800,000'—more than one half of the whole. Are three-sevenths of the remainder of the world's population Jews and Mahometans? About three-sevenths of the remainder of the population of London rank as heterodox, inconsistent, worldly professors of Christianity—a disgrace to the Christian name. Do only the other four-sevenths of the human race profess the Christian religion? The same small proportion of your city population—yes, and less than that—only about 300,000—a fifth of the whole—are regular and orthodox worshippers. Appalling, then, as is the religious state of the world, it is, I repeat, still more startling to think, that the religious condition of London—London in the nineteenth century of the Christian era—in the third of the Protestant Reformation—of favoured London, is just its epitome.

"But do you ask for a brief description of the state of that first great division of 500,000 or 800,000, or, taking the middle number, 650,000 ungodly human beings? What is their state? It is a condensed mass of heathenism, which, if drawn out and diffused over a large space in which it could be examined in detail, would amaze and alarm you into benevolent activity. What is their state? It is a concentration of depravity so virulent that it might suffice to inoculate a continent—a world with vice. What is their state? It is as bad as the most perfect system of evil which the tempter could devise, and keep in constant operation, with no other check than the feeble voice of human law, can make it. What is their state? 12,000 children are always training in crime, graduating in vice, to reinforce and perpetuate the great system of iniquity: 3000 persons are receivers of stolen property,—speculators, and dealers in human depravity: 4000 are annually committed for criminal offences: 10,000 are addicted to gambling; above 20,000 to beggary: 30,000 are living by theft and fraud. That this dreadful energy of evil may not flag from exhaustion, it is piled and fed with three millions' worth of spirituous liquors annually: 25,000 are annually found helplessly drunk in the streets. Above 150,000 are habitual gin-drinkers; and about the same number of both sexes have abandoned themselves to systematic debauchery and profligacy. Such is their ordinary state. Nay, it has grown worse while I have been describing it. Like the magic erections in Pandemonium, in addition to the 5000 temples of drunkenness and vice already existing, other 'fabrics huge rise like an exhalation.' The statistics of evil are ever on the increase.

"But does not the return of the Sabbath form an exception to this state? It does—but an exception of the most fearful kind—for it consists in their state then being aggravated tenfold: 650,000 human beings then stand up and say, in the face of heaven, 'there shall be no Sabbath! As far as the scriptural observance of the day is concerned, there shall be no Sabbath. We will rest from our ordinary labour only to toil in sin—the day shall be set apart to evil.' And in obedience to this fearful decree, issued as from the throne of wickedness, the temples of vice are early thrown open, and thronged with impious devotees; the press issues its weekly manuals of slander and sedition, impurity and blasphemy; every minister of evil is then in full employ, aided by numerous helpers, called in for the occasion; in many districts, the ordinary market is quickened into the bustle and riot of a fair; the quiet of the week is broken up by the carnival of the Sabbath; the great volcano of iniquity heaves and rises, and discharges its desolating contents into the country for miles around; every available form of art is pressed into the service of sin; the whole satanic system of depravity is in

active and universal operation; and vice holds its saturnalia. Such is their Sabbath state.

"When the Almighty would impress Jonah with the extreme depravity of Nineveh, he spoke of it as a gigantic personification of evil, which had actually come up, and obtruded to his very throne. But, were the guilt of the metropolis to be embodied, who could describe its colossal stature, its Titanic daring, and revolting aspect? When he would show Ezekiel the abominations of Jerusalem, he led him through successive chambers of imagery, on the walls of which were vividly portrayed all their dark and idolatrous doings. But were a similar representation of the abominations of London to be attempted, what is the emblematic imagery that would do them justice? Where are the colours dark enough, and the imagination sufficiently daring, to portray the guilty reality? There must be seen groups of demons in human shape, teaching crime professionally; initiating the young in the science of guilt; and encouraging their first steps towards destruction. There must be trains of wretched females, leading thousands of guilty victims in chains—and leading them through a fearful array of all the spectres of disease, remorse, and misery, ready to dart on them. There must be theatres—with a numerous priesthood pandering to impurity—and offering up the youth of both sexes at the shrines of sensuality. There must be splendid porticoes, the entrances to which must be inscribed—*Hells*; and on the breast of each of those entering must be written, in letters of fire, *Hell*. There must be a busy Sunday press, worked by the great enemy himself, in the guise of an angel of light, and despatching myriads of winged messengers in all directions, on errands of evil. There must be infidel demagogues "mouthing the heavens;" and gaping crowds admiring the skill that blindfolds them for destruction. There must be gorgeous palaces, in which death and disease shall appear holding their court; in which busy hands shall be seen distributing liquid fire to crowds of wan and squallid forms;—and each of those palaces must be shown standing in the midst of a jail, a poor-house, a lunatic asylum, and a cemetery, all crowded—and leaning over the mouth of the bottomless pit. And over the whole must be cast a spell—an all-encompassing network of satanic influence, prepared, and held down, and guarded by satanic agency. And, to complete the picture, three hundred thousand Christians passing by without scarcely lifting a hand to remove it."

But the introductory portion of the "Christian Citizen" we consider as by far the most valuable; not in point of composition, for the sermon rises in eloquence, and the peroration glows with a heavenly fervour,—but the views stated, and the principles laid down at the commencement of the discourse, as they will appear novel to many Christians, so they will awaken them to serious consideration, and, as we hope, may lead them to regard the obligations of Christianity as extending to all the social, conventional, and political relations subsisting among men. We do not cease to be citizens, in the civil or social sense of the term, when we become Christians; but, as it regards the present state, we become Christians that we may act the citizen as becomes the Gospel of Christ.

With an extract from this branch of the subject we take leave for the present of Mr. Harris, hoping soon to meet him again; when, perhaps, he will introduce us to "Britannia," the queen of nations, and, as we trust, the benefactress of the world.

"The spirit of the text is not only patriotic, but practical. Religion, so far from withdrawing us from the active duties of life, instructs and prepares us to discharge them. It knows nothing of the recluse. It has not a word of encouragement for the virtue of the cloister. It furnishes no rules for the monk, the mystic, and the quietist. 'Wisdom crieth without; she crieth in the chief place of concourse; in the city she uttereth her words'; that is to say, the busiest sphere of the world is the busiest sphere of religion. And the man who retires into inactive solitude, not only runs from the field in the heat of the conflict, but, as far as his secular obligations are concerned, he voluntarily incurs a civil death; and, as far as his religious obligations to others are concerned, he is chargeable with a moral suicide.

"According to the Scripture theory, the Christian church should be the nursery and school of all practical excellence; capable of supplying the world with the noblest specimens of wisdom and virtue, for filling offices of utility and trust. Like a city set upon a hill, it should be conspicuous from afar, that all might know where to look for 'whatsoever things are honest, lovely, and of good report.' Here the irreligious master should always be able to find the most faithful servants, and the unchristian servant to find the most considerate and kind of masters. Were the city should find its purest citizens, the state its most incorruptible magistrates and legislators, and public liberty its ablest champions. Not only is Christianity compatible with the discharge of civil or social duties, it will not absolve us from them

—will not allow us to be idle spectators on the great theatre of life. Destroying every selfish passion, it teaches us to consider ourselves as parts of a great community, and consecrates every talent to the public good. Its golden law of love commands us, by legitimate means, to break the fetters of the slave, to watch over the interests of the social body, and to act as the anointed guardians of truth and freedom; so that if at any time they should be driven from every other home, one asylum at least might remain to which they might repair, and whence they might again issue forth, armed and reinforced from heaven.

"The exhortation in the text is not only social and active; by addressing the Philippian Christians, by implication, in their civil capacity, it reminds us that religion is condescending as well as practical, and condescending that it may be practical. Though its ultimate aim is to train us up for a heavenly city—to make us free of the kingdom of God—it will not allow us to forget that, for the present, we are members of an earthly community, and calls on us to discharge the consequent duties. Indeed, it seeks to prepare us for the duties and immunities of that higher state, partly, by exercising us in the duties belonging to our earthly condition. Of the great philosopher of antiquity it is said, to his honour, that he drew philosophy down from the clouds to walk among men, converting it from empty speculation into a practical benefit. In a far more exalted sense, this praise belongs to the Gospel. Though it is conversant with the invisible, the universal, and the infinite, it stoops to the sensible, the particular, and the minute. Though it prescribes the course of an angel's flight, it stoops to guide an infant's feet, and, if need be, steps over thrones to do it. It enters the private dwelling, mingles with its inmates, and addresses an appropriate word to the husband and wife, the parent and the child. It takes the servant by the hand, and leads him to his daily task, and thus invests his station with a dignity, beside which the most splendid idleness is eclipsed and disgraced. It accompanies the tradesman to the place of business, takes its seat by the judge, and to the Christian patriot it says daily, 'Be the citizen, in a manner worthy of the Gospel of Christ.' It never quits the ground except to convey its disciples to heaven. Like him who went about doing good, its majesty is the majesty of condescension; and while it seems to be intent only on the happiness of eternity, it overlooks nothing connected with the well-being of time.

"And another introductory remark suggested by the text is, that wherever the Gospel comes, and whatever the secular station in which it finds its disciples, it aspires to raise the tone, and become the motive and standard of their morality. As a solitary savage, man is governed only by appetite and climate. Associated with others uncivilized like himself, he is influenced by a sense of mutual dependence and by custom. As a member of a civil community—a citizen—he is governed by law. And beyond this, under the refining influence of civilisation, he may come to form an idea, a theory, of what a citizen should be, far superior to the literal requirements of the law under which he lives. Such an idea appears to have actually obtained, and to have obtained first in Greece. 'Each man,' says Plutarch, 'each man concluding that he was born, not for himself, but for his country.' The peculiar state of society in the little commonwealths of Greece, made patriotism not merely a governing principle, but rather an ungovernable passion. With them, the very city itself—the *polis*—became an imaginary being, demanding the sacrifice of each to all, the annihilation of the individual interest to the general good. How beautifully has Socrates, in the *Crito*, or, *the Duty of a Citizen*, portrayed this stately personification of the commonwealth, as approaching and addressing him on the eve of his martyrdom,—forbidding him to escape even from an unjust sentence, when escape was possible. And, by submitting to that sentence, rather than evade and weaken the authority of the law, he, perhaps, of all the ancients, most nearly realized the heathen idea of a perfect citizen. The writers of the Roman empire, though with motives far inferior to the Greeks, adopted the same lofty notions of the self-sacrificing duty of the true citizen.

"Now the Apostle knew this. He was himself a Roman citizen, and gloried in the distinction. But, aware as he was of the exalted ideas which prevailed on this subject, he knew that the Gospel could carry those notions higher still. And more, he knew that while their conduct, as heathen citizens, had formed a striking contrast to their theory of duty, the Gospel would put that theory into action, and turn their notions into reality. He knew that the Gospel, wherever it comes, takes all that it finds there of wise and good under its protection—erects a higher standard of morals—gives new motives to duty, and new sanctions to law. He knew that, civilized as the community might be, Christianity would there arm justice with a keener sword, and present her with balances more perfect than she possessed before—that it would throw its shield over oppressed and prostrate virtue—become the rallying point from every quarter for conscience and right—and cultivate all the fruits of a self-denying benevolence. He knew that it would do more than this—that it would exalt the man into the saint—raise the citizen into the Christian—into an agent of mercy to all around him. What miracles of moral transformation had it not accomplished! Was not the apostle—was not Philippi itself, an instance? There, its first triumph was to change the very jail into a church—the receptacle of a city's depravity into a sanctuary of God. There, by the plantation of a Christian church, it had created a city in a city—a centre of holy activity in the midst of a wide circumference of evil—and should it not enlarge and enlarge till it had pervaded and embraced the whole? 'O,' said he, 'Philippian

Christians, act the citizen—act him, not in a secular sense merely—act him not merely by assuming a higher tone of morality than your fellow-citizens—do not be satisfied with *that*—propose loftier aims than *that*. Let them see that Christianity is a new nature, as well as a new name—that it has baptized and elevated your secular duties into acts of religion—that it has fused all your affections together as the heart of one man—that it has turned all your motives into love—and that animated by *that*, you heed not their weapons of persecution, but are filled with an irrepressible concern to save them from destruction. In a word, *act the citizen, as if becometh the Gospel of Christ*. And you know how *that* is. You know the grace of our Lord Jesus

Christ. You know the objects at which he aimed, and how he laboured to achieve them. Make him your model. Seek the salvation of men as he did. Live for this object as he did; and, if necessary, *die* for it. He has brought salvation to *you*—he has given *you* a citizenship in heaven. O, as if you had already been there, had walked its golden streets, and feasted on its ennobling joys, and had again returned to take others with you, labour for this godlike end. By union with each other, by a spirit of dependence on God, by zealous endeavours for the salvation of those around you, act the Christian citizen—and let what will transpire, you shall be sustained, your Saviour's kingdom shall advance, and heaven be filled with joy."

MEN AND THINGS.

THE HUMAN STATURE.—The idea that the original progenitors in the human race were exceedingly large and tall of stature, is still held by some European writers. Not many years since, a French author published a work in which he endeavoured to prove that there has been a gradual depreciation in the size of man, from the commencement of the world downwards, and that the same lessening control will continue to exert an influence until the end of time. A corresponding decrease in the age of mankind may be observed, it is alleged, by inquiry into the longevity of the human race, in the several centuries of the world. Some contend, also, that the deficiency in the number of years between the various personages noticed in the ancient sacred writings and those of our day, is more than counterbalanced by the great increase of our species throughout the world; and that, in the place of accumulated years, we have accumulated numbers, whose existence is brief, that the earth may not be filled to overflowing. All these are curious speculations, not without interest to the inquiring mind.

A French author, an academicien of some note, calculates that Adam was 123 feet 9 inches in height, Noah a little over 100 feet, Abraham 80, Moses 30, Hercules 10, Alexander 6, Cæsar less than 5. Progressing in this ratio, in a few years hence the world will be filled with a race of Lilliputians.

MILTON.—Milton, the poet of "Paradise Lost," who, during an active life in the most troublesome times, was unceasing in the cultivation of his understanding, thus describes his own habits:—"Those morning haunts are where they should be—at home; not sleeping, or concocting the surfeits of an irregular feast, but up and stirring: in winter, often ere the sound of any bell awake men to labour or devotion; in summer, as oft with the bird that first rouses, or not much tardier, to read good authors, or cause them to be read, till attention be weary, or memory have its full fraught. Then with useful and generous labours preserving the body's health and hardiness, to render lightsome, clear, and not lumpish, obedience to the mind, to the cause of religion, and our country's liberty."

EDUCATION.—Thelwall thought it very unfair to influence a child's mind by inculcating any opinions before it should have come to years of discretion, and be able to choose for itself. I showed him my garden, and told him it was my botanical garden. "How so," said he, "it is covered with weeds?" "O," I replied, "that is only because it has not yet come to its age of discretion and choice. The weeds, you see, have taken the liberty to grow; and I thought it unfair in me to prejudice the soil towards roses and strawberries."—*Coleridge*.

IDLENESS.—The Egyptians held idleness to be a capital crime. Amongst the Lucans, he who lent money to an idle man could not recover it by law. The Lacedæmonians called the idle to account; and the Corinthians delivered them up to the crucifix. Antoninus Pius caused the houses to be unroofed which

sheltered the idle. Solon's law against idleness was certainly not suggested by Satan.

CLOCKS AND SUN-DIALS.—Perhaps of all the works of man, sun-dials and church-clocks are those which have conveyed most feeling to the human heart; the clock more than the sun-dial, because it speaks to the ear as well as to the eye, and by night as well as by day. Our forefathers understood this, and therefore they not only gave a tongue to time, but provided that he should speak often to us, and remind us that the hours are passing. Their quarter-boys and their chimes were designed for this moral purpose, as much as the memento which is so commonly seen upon an old clock-face, and so seldom upon a new one. I never hear chimes that they do not remind me of those which were formerly the first sounds I heard in the morning, which used to quicken my step on my way to school, and which announced my release from it, when the same tune, methought, had always a merrier import. When I remember their tones, life seems to me like a dream; and a train of recollections arises which, if it were allowed to have its course, would end in tears.—*The Doctor*.

HABITS OF MUSICAL COMPOSERS.—Sacchini could not write a passage except his wife was at his side, and unless his cats, whose playfulness he admired, were gambolling about him. Paisiello composed in bed, Il Barbiere di Siviglia, La Molinara, and other *chefs d'œuvre* of ease and gracefulness. Zingarelli would dictate his music after reading a passage in one of the fathers of the church, or in some Latin classic. Hayden, solitary and sober as Newton, putting on the ring sent him by Frederick II., and which, he said, was necessary to inspire his imagination, sat down to his piano, and in a few minutes soared among the choirs. Nothing disturbed him at Eisenstadt, the seat of Prince Esterhazy; he lived wholly for his art, exempt from worldly cares, and often said that he always enjoyed himself most when he was at work. Cimarosa was fond of noise; he liked to have his friends about him when he composed. Frequently, in the course of a single night, he wrote the subjects of eight or ten charming airs, which he afterwards finished in the midst of his friends.

GENERAL JACKSON.—A preacher in the western country, says the "Illinois Gazette," applied to General Jackson for an office. At the time he applied the general did not know the applicant was a preacher; and he very politely observed to him, that he would think of his claims and weigh them. The preacher saw the general a few days after, and renewed his application. The general having, in the mean time, obtained information that he was a minister of religion, asked him if he was not a preacher of the Gospel. He answered he was. "Well," said the general, "if you discharge the duties of that office, which is better than any I can confer, you will have no time for any other. I advise you to return home, and attend to that, without being burdened with any other, that you may be enabled to account hereafter for your stewardship in this world."

VALLEY OF THE AMAZON.

RIVERS, AND THEIR TIDES AND NAVIGATION.

At page 43, in No. III., of the "Miscellany," we gave some notice of this splendid and fertile, but hitherto much neglected portion of the surface of our globe. What we there said was, however, a mere beginning; and upon all exclusive subjects, it would defeat the very purposes for which our work is specially intended, were we to give a laboured essay on the whole. Our proper vocation consists in touching only a point or two in any one paper; but always touching them in such a way as that the moral march of time may furnish the materials of a thought in the little hours which must occur in the most active life.

To tell the whole tale of the Amazon, or of any of the great rivers which adorn and enrich our globe, would be too much for almost any writer. Prose, poetry, and picture, have been all at work for many years in attempting to illustrate our own Thames; and yet, of the three millions and a half of people (for the number is not less than that) which inhabit its valley, from its source to the open sea, there is probably not one in ten thousand who knows any thing about it. In fact, to exhaust the story of a river and its valley, is just as hopeless as it was in the rustic mentioned by Horace, who sat down on the bank till the current should exhaust the water, and enable him to pass over dry-shod.

We formerly mentioned that the Amazon is remarkably well adapted for navigation; but we must add, that hitherto that navigation has been almost totally neglected; and that there has actually been as much sailing on the Mackenzie river, in North America, which is half the year bound up in ice, and flows into an ice-bound sea during the other half, as there has been on the Amazon, which flows into the tropical Atlantic, in the very centre of the world's commerce.

There are various reasons for this, of which some are political and some natural; and we mention the political ones first, because if they had not existed, the others might have been overcome; or, at all events, the trade of the river might have been adapted to them.

When the Spaniards and the Portuguese divided South America between them, they divided the river by a cross section, the Spaniards taking the upper part, and the Portuguese the part next the sea; and though they both equally neglected the Valley of the Amazon, each played "the dog in the manger" to the other in the use of it, as a means of entrance between the interior of the country and the sea. When two nations front a river longitudinally it is bad enough, especially when those nations quarrel, or rather when those who have the management quarrel in their names. This has been painfully felt in the case of the St. Lawrence, as the boundary between Canada

and the United States; and the wars on that frontier have been marked by the greatest atrocities, and produced animosities, the bad effects of which have been long felt.

It does not appear, however, that this division of the great stream of the Amazon into an upper, or Spanish part, and a lower, or Portuguese one, was the real and original cause of there being no navigation on the river; for the valley was totally unregarded. All the fine rivers and the fertile plains were neglected, while the Spaniards, on the one hand, were torturing their slaves amid the snows of the Andes, in search of gold and silver, and the Portuguese, on the other, were torturing them in washing the sand and gravel of the Terra de Frio, in quest of diamonds,—the bondage in both cases being more terrible than any that the children of Israel could have suffered in Egypt, there they associated as a nation, and dwelt in the land of Goshen; whereas the poor slaves in the west and the east of South America, were cooped up by ones, twos, and threes, in holes of the earth, and that in places the most desolate and dismal. The grand cause of this has now, to a considerable extent, ceased; but the social mischief of such misrule and perversion is not cured for ages.

The natural obstacles to the navigation of the Amazon, occur at or near its confluence with the Atlantic. They are not very formidable, and all of them might probably be got the better of by skill, if a sufficient inducement to the employment of that skill could be established.

The set of the tide, and the prevailing wind is always an important element when we are endeavouring to ascertain with what safety or danger the mouth of a river may be entered or left by shipping. The set of the tide on the north-east coast of South America, from Cape St. Roque, north-westward, to beyond Trinidad, where it begins to slacken, is along the line of the coast, only lagging as it nears the shore, and thus turning more into the mouths of the rivers. This current of tide has a maximum impulse; for, in the mid Atlantic the vibration extends over about seven thousand miles in twelve hours. While one part of this tidal vibration enters the estuaries of the large rivers, the more seaward portion keeps racing by; and thus forms a sort of bar of the water itself.

The only great river on this part of the coast, besides the Amazon, is the Orinoco, which enters the sea by many mouths in the dry season, and unites with it as a great lake during the floods. Trinidad hems in the tide current here, and the navigation is generally difficult, and often impracticable.

The Amazon enters the sea by two principal mouths, which are separated from each other by

N

Joannes, an island about 120 miles each way, and with its north coast almost immediately on the equator. The western channel is the principal mouth of the Amazon, as it opens in nearly the direction of the river; but it is much broken by islands and banks; and there lies an island, Christiana, in the middle of it, just without Joannes, which is at least fifty miles long. Behind this, the water is in general very turbulent, and as a passage it is very unsafe.

The eastern channel, that of Para, is much more open, and it is also less turbulent in the character of its waters, hence it is the entrance to the river. It is not so properly the mouth of the Amazon, however, as it is the mouth of the Tocantius, a river of Brasil, which flows almost directly north; and that river, like the Danube and some others, is named after the wrong branch; for the Araquay, a western branch of it, is considerably longer than the eastern, which is the Tocantius, in the upper country. The river or channel of Para, takes a bend round the south side of the island of Joannes, with its convexity towards the south; and it joins the other, and principal mouth of the Amazon, at the south-west angle of that island. The land contains a considerable number of islands and banks, but the water is more tranquil among them than it is among the interruptions in the main channel. The wind, and the tide, and current of the river have considerable influence in causing the greater commotion there; but that can be more clearly explained afterwards.

The town of Para is situated on the main land, nearly opposite to the east side of Joannes. It is the resort of a few ships, and carries on a little trade beside; but it is a very miserable place, considered as the port of the finest river in the world. Its population is motley and poor; and the place itself is very dirty and very unhealthy; and if even the commerce of the Amazon shall become worthy of the majesty of the river, and the great extent and fertility of the valley, a new city will require to be built at some other spot.

The set of the winds tends just as much to produce disturbance and agitation of the water at the mouth of the Amazon, as the general set of the tidal waves; being immediately under the equator, it is within the influence of the trade-wind at all seasons of the year. The general direction of these winds is from the east, though they shift a little to the north of east in our winter, and to the south of east in our summer. The force of this trade-wind is not much felt in shore, especially in the dry season, when the sea and land call and answer to each other alternately, in the different portions of each day, in the sea and land breezes; and indeed the trade-wind, though very steady, is not a violent wind under any circumstances. Its constant action, however, produces a considerable effect upon the water of the sea, which is worked by it into a

sort of inclined plane, pressing more on the American shore than on that of Africa. Upon the whole, this set of the winds, and consequent elevation of the ocean waters, are very advantageous to America; and the countries which lie along this shore are greatly indebted to them for that wonderful richness and beauty of vegetation which they display. In this the valley of the Amazon partakes very largely; and the influence of the trade-wind is felt almost to the base of the Andes, or at any rate to the vast forest which stretches along that base; and which, from its vast display of growing foliage, has some of the effects of an expanse of water, in keeping moisture in the district as an element of fertility.

This may be seen, by taking the map, or a good description, and comparing the upper valley of the Amazon with that of the Orinoco. Angostura is not more than 250 miles from the mouth of the Orinoco, and the plains near Angostura are parched to absolute barrenness during the dry season. On the Amazon, again, what may be called the sea-side vegetation, may be said to extend fully 500 miles up the river, while the plains near the banks are no where burnt up; yet the two rivers inosculate by some of their branches,—that is, a branch of each flows from the same upland morass, which morass is a lake during the rains. The mouths of the Orinoco are not situated for receiving the influence of the trade-wind so directly as those of the Amazon, and the action of the trade begins to abate before it reaches Trinidad.

The tide-wave is propagated a great way up the Amazon. The tides are quite perceptible at the distance of full 600 miles from the sea; which is the most extended tidal action in any river. The extent of tide in the St. Lawrence, to a point between Quebec and Montreal, is not more than 430 miles; and the greater part of that is sea, which certainly may be considered as extending as far as Quebec.

There is no question that this great length of tide-way would greatly facilitate navigation on the Amazon. It must be understood that the tide does not carry a vessel by a transfer of the water upon which the vessel floats; for, not only in tidal rivers, but sometimes also in the sea, the current of the water goes in the very opposite direction to the tide-wave. But the vessel slides down the inclined plane formed by the side of the tide-wave; though it never gets on as fast as the wave; and thus, when the summit of the wave passes the vessel, the inclined plane is turned the other way, and the vessel would slide just as far the other way, if it were not anchored in the stream, or made fast to the bank. Indeed, in ascending the tide-way of a river, a vessel would drop farther downward in every ebb of the tide-wave than it would rise upwards in the flow; and thus, if a vessel were left floating on the surface of a tidal river, it would in time be

floated out to sea, if it were not stranded on the banks, which would always be the case unless some means were used to prevent it. The reason is obvious: the motion of the river water is downwards, and this is against the upward motion which the ship gets from the tide, and in favour of the downward motion; and the two combined must, in time, carry the ship to the utmost point to which the influence of the river extends, and there deliver it to what motion of the ocean water may be there. Anchoring or hauling on shore during the ebb, when the slope is downwards, gets the better of this; and as there are eight upward, and eight downward slopes, at the same time, that is at all times in the long-tide way of the Amazon, it is easy to see how greatly these would facilitate its navigation. The tideway of the Thames, from London bridge to Teddington, is about 17 miles, taking the windings of the river; and the high water, in average states of the river, takes about two hours and a half, or three hours, to travel this distance; but the low water takes nearly double the time, that is, about five hours to travel the same distance. The effect of the current of the river on the tide-wave is very much the same as it is

on a vessel; and thus the difference of these times may be regarded as expressing twice the effect of the descending current of the Thames, which is thus about half that of the rising tide in propelling the vessel upwards. When the river is swollen this will be a maximum, or the difference of rate between the motion of high and low water, will be the greatest possible, and when the river is low in dry weather, it will of course be the least.

Closely connected with this lowness of the river, at certain seasons, and the consequent lagging of the high water upon the ebb, there is a curious phenomenon in various rivers, called the "bore," which is more splendid in the Amazon than in perhaps any other river. Among our own rivers, there are some very remarkable instances of this bore, the most conspicuous of which is the Severn, though it occurs also in some of the fen rivers, as the Nen and the Welland. This is a curious subject; far from an uninteresting one, and as such well worthy a few minutes' chat. But we must stop in the meantime, lest the reader should find a *bore* in our article, greater than that in the river.

THE CONNEXION OF THE SCIENCES.

WHEN an infant first opens its eyes upon this beautiful universe, it must appear like one blaze of light and glory. The unaccustomed eye cannot perceive the character of surrounding objects, their distances, dimensions, and configurations, or even their separate existence: but as the powers of vision strengthen and expand, the indistinctness of the primary impression is removed. The child then observes that the visible creation comprehends an infinite variety of objects; the earth and the heavens exhibit wonderful forms and combinations; trees, mountains, rivers, oceans open to view, and over his head ten thousand brilliant orbs sparkle from afar in the depths of space. Were it not for their gradual development the scene would fill him with overwhelming astonishment. These are at first observed in their masses, but the next process is that of contemplating them in their distinctive forms, and by comparison arriving at the conclusion that they are small or large, square or round, fixed or fleeting; in short, ascertaining their respective qualities, so as to identify them in the mind, and to describe them in appropriate language. Then the various *relations* of things to the whole visible panorama and to each other individually, begins to be perceived; till by degrees their *connexion* is traced. This, so far as relates to the general observation of mankind, is but very superficial and imperfect, though still sufficient to guide their ordinary actions and to provide for common necessities.

There is a discernable analogy between the physical and mental developments of our nature; and then between the progress of infancy and the advance of science. In the earliest period of the history of our world, in its infancy and the infancy of *man*, we may readily conceive of the contemplative shepherd watching not only his flocks by day or by night, but employing his otherwise unoccupied hours in ruminating upon the wonderful scenes around him, which in the starry heavens and the outspread earth, *compelled* his attention. He saw the sun rising and setting, the seasons going and returning, the worlds of light beaming through the darkness, and the moon pursuing her tranquil course; and thus he would become an astronomer and philosopher *per force*. The man of greater refinement or deeper research would extend these more general and superficial notices, to an exacter and more curious inquiry into the particular objects or classes of objects brought under his observation. He would then observe their characters, forms, and relations, and, as we find at a very ancient date in the history of scientific investigation, begin to bring them into system and arrangement. He would consider them separately, then compare and combine. Thus the infant eye of philosophy opened gradually upon the universe; but years and ages were required for the correction of errors, the adjustment and classification of facts, and the discovery of universal laws. Systems were invented, and by the progress of knowledge

destroyed and replaced by others ; so that what was merely apparent or conjectural came to be established in its reality, or set aside in its illusions. So that, as Bonnycastle has beautifully expressed it, with regard to one of those processes of discovery—that is, the establishment of the true solar system by Copernicus after the Pythagorean doctrine of the planetary motions—“ Seized with a daring enthusiasm, he (Copernicus) laid his hands on the cycles and crystal orbs of Ptolemy, and dashed them to pieces. And with the same noble frenzy, took the unwieldy earth and sent her far from the centre of the system, to move round the sun with the rest of the planets ; so that of all the celestial equipage with which she had been formerly dignified, there only remained the moon to attend and accompany her in her journey.”

The discovery, therefore, of the connexion and rotation of objects to each in the same system of classification bespeaks the progress of knowledge. First they are viewed in their individual forms and characters, then in their remote or proximate relations, which are most obvious and common, then in their more minute peculiarities. By combining and sifting a vast accumulation of observations, outlines of systems are obtained, and at length the general discoveries within those respective limits are themselves systematized and reduced to rule or probability. At length science ascends a higher pinnacle and takes a more vast and comprehensive view. These individual systems are seen from this new height, first probably attained by some commanding genius, not only in their separate and individual character, but in their connecting links. What had previously appeared distinct and sole is then seen in union with other systems and combinations, till the golden chain which binds the universe of matter is perceived encircling, pervading, and winding along through all the regions of the mighty whole, and fastened to the throne of Deity!

It has been truly remarked, that astronomy affords the most extensive example of the connexion of the physical sciences ; or rather, perhaps, it should have been said, that it presents at present the most obvious and striking example. After all the discoveries that have been made, the progress of general knowledge has been slow, and the field of observation is still very limited ;

but as every day shows the apparent barriers not to be impassable, but only like the seeming ridges of lands that loom along the horizon of the mariner even in the centre of the ocean, it may be anticipated that futurity will disclose equal if not more of nature's hidden links of associated or correlative sciences. As, however, gravitation holds its place, or moves in its orbit every luminary of heaven, and every particle of earth, astronomy appears to conduct us to a general law, and to disclose the principal facts of the physical universe in relation to rest and motion, as well as number and quantity. The discoveries, however, which are peculiarly astronomical have an intimate relation to the planetary and terrestrial phenomena, and to the electric, galvanic, and magnetic fluids that traverse the regions of air, or pervade the other portions of nature and of matter. In following the golden thread of creation, we perceive that the magnitude of the earth affords the materials for ascertaining the extent of the solar system, and provides a foundation for a system of weights and measures ; we see that the figures of planets depend on their rotation, and their motions affect the forms of their satellites ; that the reciprocal attractions of the celestial bodies disturb the fluids at their surfaces, and they suggest a theory of atmospherical tides and oscillations ; that the effects of temperature lead to the doctrine of the barometer, and the laws of capillary attraction ; and that by detecting the undulations of the aerial medium we find the basis of acoustics and all that relates to sound. We discover, also, in connexion with this department of knowledge, the method by which light is propagated, and are led to ascertain its nature, its properties, and its velocity ; which, in the aberration of the fixed stars, conducts to the direct evidence of the earth's real motion. The effects of invisible rays are connected with chemical action, and thence research pursues its unwearied way through all the mazes of the operations of heat, in the interior and on the surface of our globe. Thus chemistry, geology, electricity, with their dependent facts and systems, spring into view, and open to the mental vision, enlarged and ever enlarging conceptions of the mighty whole. And what can we say, but “ Great and marvellous are thy works, O Lord God Almighty !” X.

CHILDHOOD.

HAIL! artless childhood, joys indeed are thine,
Joys which maturer years implore in vain ;
At thought of thee I feel a glow divine,
And long once more to prove thy peaceful reign.
With fond delight I love the days to trace,
While life, and thought, and hope, and joy were young,
When nought but smiles adorned my infant face,

And not a lowering cloud obscured my sun.
With thee each day was spent in artless joy,
With thee each night expired in balmy sleep,
No care arose my pleasure to destroy,
No griefs to teach my infant eyes to weep.
Those happy days are o'er, and now in vain
I seek the peaceful blessing, of thy reign.

THE ADVENTUROUS BOY.

WHILE the fleet lay at anchor, one of the most heart-thrilling scenes occurred on board the commodore's vessel that my eyes ever witnessed. In addition to the usual appendages of a ship of war, there was a large and mischievous monkey on board, named Jocko, retained for the amusement and diversion of the ship's company. It was my watch on deck; and having retired to the side of the vessel, I was musing on the beautiful appearance of the fleet, when a loud and merry laugh burst upon my ear.

On turning to ascertain the cause of such an unusual sound on a frigate's deck, I perceived the commodore's little son, whom the crew nicknamed "little Bob-stay," standing halfway up the main-hatch ladder, clapping his hands, and looking aloft at some object that seemed to inspire him with a deal of glee. A single glance explained the occasion of the merriment. As Bob was coming up from the gun-deck Jocko, the monkey, perceiving him on the ladder, and dropping suddenly from the rigging, leaped upon his shoulder, seized his cap, and running up the main-top-sail sheet, seated himself on the main-yard.

Here he sat picking the tassel of his prize to pieces, occasionally scratching his sides, and chattering, as if in exultation for the success of his mischief. Bob being a sprightly, active fellow, did not like to lose his cap without an effort to regain it. Perhaps he was the more strongly incited to make chase after Jocko, from observing me smile at his plight, and hearing the loud laugh of Cato, a black man, who seemed inexpressibly delighted at the occurrence.

"Ah! Jocko," said the black man, "hab you no more respec for de young officer den to steal his cab? We bring you to de gang-way, you black nigger, and gib you a dozen on de bare back for a tief." The monkey looked down from his perch, as if he understood the threat of the negro, and chattered a sort of defiance in answer. "Ah, ah! massa Bob, he say you mus ketch him fore you flog him; and 'tis no easy matter for a midshipman in boots to ketch a monkey barefoot."

The cheeks of little Bob looked red as he cast a glance of offended pride at Cato; and springing across the deck, in a moment he was halfway up the rigging. The monkey quietly watched his motions; and when nearly up, suddenly put the cap on his own head, and ascended to the top crosstrees, and quietly seating himself, resumed his work of picking the tassel.

In this manner the mischievous animal succeeded in enticing Bob as high as the royal-mast-head, when suddenly springing on the rigging, he again descended to the foretop, and running out on the fore-yard, hung the cap on the end of the studding-sail-boom, where, taking his seat, he

raised a loud and exulting chattering. By this time Bob was completely exhausted, and not liking to return to the deck to be laughed at, he sat down on the cross-trees.

The spectators presuming that the boy would not follow the monkey, but descend to the deck, paid no further attention to them. I also had turned away, and had been engaged some minutes, when I was suddenly startled by a cry from Cato, exclaiming that Massa Bob was on the main-truck! A cold shudder ran through my veins as the word reached my ears. I cast my eyes up—it was too true.

The adventurous boy, after having rested a little, had climbed the skysail-pole; and at the moment of my looking up, was actually standing on that circular piece of wood on the very summit of the loftiest mast, at a height so great, that my brain turned dizzy as I looked up at him. There was nothing above him or around him but empty space, and beneath him nothing but a small, unstable wheel.

Dreadful temerity! If he had attempted to stoop, what could he take hold of to steady his motion? His feet covered up the small and fearful platform on which he stood; and beneath that a long, smooth pole, that seemed to bend beneath his weight, was all that upheld him from destruction. In endeavouring to get down, he would inevitably lose his balance, and be precipitated to the deck—a crushed and shapeless mass.

In this terrible exigency what was to be done? To hail him and inform him of his danger, it was thought, would ensure his ruin. Every moment I expected to see the dreadful catastrophe. I could not bear to look at him, and yet could not withdraw my gaze. A film came over my eyes, and a faintness over my heart. By this time the deck was covered with officers and crew, to witness this appalling, heart-rending spectacle. All seemed mute; every feeling, every faculty seemed absorbed in one deep, intense emotion of agony.

At this moment a stir was made among the crew about the gangway, when the commodore, the boy's father, made his appearance. He had come on board without being noticed by a single eye. The commodore asked not a question, uttered not a syllable. He was an austere man; and it was thought by some that he did not entertain a very strong affection for his son. All eyes were now fixed on him, endeavouring to read his emotions in his countenance.

The scrutiny, however, was vain; his eye retained its severe expression, his brow the slight frown it usually wore, and his lip its haughty curl; in short, no outward sign indicated what was passing within. Immediately on reaching the deck he ordered a marine to hand a musket,

when, stepping aft, and leaping upon the look-out block, he raised it to his shoulder, and took a deliberate aim at his son, at the same time hailing him with his trumpet, in a voice of thunder.

"Robert," cried he, "jump! jump overboard! or I'll fire at you." The boy seemed to hesitate, and it was plain that he was tottering, for his arms were thrown about like one endeavouring to balance himself. The commodore raised his voice again, and in a quicker and more energetic tone cried, "Jump! 'tis your only chance for life." The words were scarcely out of his mouth, before he left the truck, and sprung out into the air. A sound between a shriek and a groan burst from many lips.

The father spoke not—sighed not; indeed, he seemed not to breathe. For a moment of intense agony a pin might have been heard to drop on deck. With a rush like that of a cannon ball, the body descended to the water; and before the waves closed over it twenty stout fellows, among them several officers, had dived from the bulwark. Another short period of suspense

ensued. The boy rose, he was alive, his arm was seen to move, he struck out towards the ship.

In spite of the discipline of a man-of-war, three loud huzzas, the outburst of unfeigned joy from the hearts of five hundred men, pealed through the air, and made the welkin ring. Till this moment the old commodore had stood unmoved. His face was now ashy pale. He attempted to descend from the block, but his knees bent under him; he seemed to gasp for breath, and attempted to tear open his vest; but in the attempt he staggered, and would have fallen had he not been caught by the bystanders.

He was borne to his cabin, where the surgeon attended him, whose utmost skill was required to restore his mind to its usual equilibrium and self-command; in which he at last happily succeeded. As soon as he recovered from the dreadful shock, he sent for Bob, and had a long confidential conference with him; and it was noticed, when the little fellow left the cabin, he was in tears.

GORMANDIZERS.

HOMOPHAGOUS and Polyphagous: appellations given to certain individuals of a depraved appetite, that enables them to devour raw meat, and various other substances, which, most unquestionably, would destroy any person not gifted or cursed with such an omnivorous digestion. Various are the ancient stories related of such voracious wretches. Ovid describes one Erisichthon, who, as a punishment for cutting down the groves of Ceres, (very possibly to obtain fuel to cook his food,) was sentenced to perpetual hunger, and terminated his gluttonous career by eating up his own limbs. The Thasian Theagenes thought nothing of an ox for his dinner; and the famed Crotonian athlete, Milo, knocked down bullocks with his fist for his daily meals, which usually consisted of twenty *minæ* of meat, and the same ration of bread. Vopiscus relates that a man was brought before the Emperor Maximilian, who devoured a whole calf, and was proceeding to eat up a sheep, had he not been prevented. To this day, in India, some voracious mountebanks devour a live sheep as an exhibition. Dr. Boehmen, of Wittenburgh, witnessed the performance of one of these polyphagous individuals, who commenced his repast by eating a raw sheep, a sucking-pig, and by way of dessert, swallowed sixty pounds of prunes, stones and all. On another festive occasion, he ate two bushels of cherries, with several earthen vases, and chips of a furnace. This meal was followed up by sundry pieces of glass and pebbles, a shepherd's bagpipe, rats, various birds with their feathers, and an incredible number of caterpillars. To conclude his dinner,

he swallowed a pewter ink-stand, with its pens, a pen-knife and a sand-box. During this deglutition he seemed to relish his food, but was generally under the influence of potations of brandy. His form was athletic, and he could carry four heavy men on his shoulders for a league. He lived to the age of seventy-nine, but died in a most emaciated state, and, as might be imagined, toothless. Helwig knew an old man who was in the habit of eating eighty pounds of different articles of food daily. Real Colomb mentions an omnivorous glutton, who, in the absence of any salutary aliment, satisfied his cravings with any other substance; and was once known, when hungry, to eat the contents of a sack of charcoal, and then to swallow the bag to facilitate their digestion. One of the attendants on the menagerie of the Botanical Garden in Paris, who bore the euphonous name of Bijou, used to devour all the offals of the Theatre of Comparative Anatomy, and ate a dead lion in one day. He was active, and lived to the age of sixty. A cannibal once desolated the Vivarais, by dragging human victims to his den, where he devoured them. On the opening of the corpse of a convict in the galleries of Brest, there were found in his stomach about six hundred pieces of wood, pewter, and iron. All these accounts might appear most exaggerated, perhaps fabulous, had not many physicians in Paris known the celebrated Tarrare. The history of this monster is as curious as his habits were disgusting. He commenced his career in life in the capacity of clown to an itinerant quack, and used to attract the notice of the populace by his singular

powers of deglutition, swallowing with the utmost ease, corks, pebbles, and baskets full of apples. However, these experiments were frequently followed by severe pain and accidents, which once obliged him to seek assistance in the Hôtel Dieu of Paris. His sufferings did not deter him from similar experiments; and he once tried to exhibit his wonderful faculties by swallowing the watch, chain, and seals, of M. Giraud, then house surgeon of the establishment. In this repast he was foiled, having been told that he would be ripped up to recover the property. In the revolutionary war Tarrare joined the army, but was soon exhausted on the spare diet to which the troops were obliged to submit. In the hospital of Sultzen, although put upon four full rations, he was obliged to wander about the establishment, to feed upon any substance he could find, however revolting, to subdue his voracious hunger. These singular powers induced several physicians to ascertain how far these omnivorous inclinations could carry him in his unnatural cravings. In presence of Dr. Lorentz he devoured a live cat, commencing by tearing open its stomach, and sucking the animal's blood with delight. What was more singular, after this horrible feat, like other carnivorous brutes, he rejected the fur and skin. Snakes were to him a delicious meal, and he swallowed them alive and whole, after grinding their heads between his teeth. One of the surgeons, Mr. Courville, gave him a wooden lancet-case to swallow, in which had been folded a written paper. This case was rejected undigested, and the paper being found intact, it became a question whether he might not be employed to convey secret correspondence; but, having been taken up at the Prussian outposts as a spy, being disguised as a peasant, without a knowledge of the language, he received a severe bastinado, which effectually cured him of an appetite for secret service; and on his return, he had recourse

to the safer means of obtaining food in kitchens, slaughter-houses, and dunghills. At last, a child of fourteen months old having disappeared under suspicious circumstances, he was driven out of the hospital, and lost sight of for four years, when he applied for admission into the hospital of Versailles, in a state of complete exhaustion, labouring under a virulent diarrhœa, which terminated his hateful existence in his twenty-sixth year. He was of the middle size, pale, thin, and weak; his countenance was by no means ferocious, but, on the contrary, displayed much timidity; his fair hair was remarkably fine and soft; his mouth was very large, and one could scarcely say that he had any lips; all his teeth were sound, but their enamel was speckled; his skin was always hot, in a state of perspiration, and exhaling a constant offensive vapour. When fasting, the integuments of his abdomen were so flaccid that he could nearly wrap them round him. After his meals, the exhalation from his surface was increased, his eyes and cheeks became turgid with blood, and, dropping into a state of drowsiness, he used to seek some obscure corner where he might quietly lie down and digest. After his death, all the abdominal viscera were found in a state of ulceration. Instances are recorded where a similar facility to swallow fluids had been observed. At Strasburg was exhibited the stomach of a hussar who could drink sixty quarts of wine in an hour. Pliny mentions a Milanese, named Norvellus Torquatus, who, in presence of Tiberius, drank three *congi* of wine. Seneca and Tacitus knew a man of the name of Piso who could drink incessantly for two days and two nights; and Rhodiginus mentions a capacious monster, called the "Funnel," down whose throat an *amphora* of liquor could be poured without interruption.—"*Curiosities of Medical Experience.*" By Dr. Millengen. 1837

HAIR BREADTH ESCAPES.—No. II.

A YOUNG POLISH OFFICER.

WHEN Murat was at Madrid, he had occasion to send some despatches to Junot, in Lisbon. These despatches were of the utmost importance, and all the roads leading from Madrid to the Portuguese capital were covered by guerrillas, or regular troops, commanded by officers who had acted an important part in the Spanish revolution, and who thus composed the army of Castanos.

Murat mentioned the difficulty to Baron Strogonoff, the Russian Ambassador, at the court of Spain, who had remained at Madrid. It is well known that at the period here referred to, Russia was the friend rather than the ally of France. Baron Strogonoff told the grand Duke of Berg, that he could suggest a plan for the transmission of the despatches.

"Admiral Siniavin," said the Baron, "is in the

port of Lisbon. Send to me one of the most intelligent of your Polish Lancers. He shall put on a Russian uniform, and I will give him despatches for the Admiral; you can give him your instructions verbally, and I will answer for it that all will be right even though he should be taken twenty times between this and Lisbon. The insurgent army is too anxious to secure our neutrality to be the first to create a ground of rupture."

Murat was delighted with the scheme. He requested the commander-in-chief of the Polish troops, who I think was Krazinski, to select for him a brave and intelligent young officer. Two days afterwards the Polish commander sent to the grand duke a young man for whom he declared he would answer with his head. He was named Leckinski, and was only eighteen years of age.

The grand duke of Berg was not a little astonished to find the young officer manifest the utmost eagerness to undertake an enterprise of no ordinary peril; for in the event of his being discovered, his fate was certain:—and that fate was death. Murat, brave as he himself was, could not refrain from pointing out to Leckinski the danger he was about to encounter. The young Pole smiled, and said, "If your imperial highness will give me your orders, I will pledge myself to execute the mission. I thank my general for having selected me from among my comrades, every one of whom was emulous of the favour."

The grand duke augured well of the young man's courage and intelligence. He gave him his instructions. Baron Strogonoff supplied him with despatches to Admiral Siniavin. The young Pole was equipped in a Russian uniform and set out for Portugal.

During the two first days he pursued his course without molestation; but on the afternoon of the third day, he was attacked by a party of Spanish troops, who unhorsed and disarmed him, and conducted him before the general commanding the military force of the district. Luckily for the adventurous young Pole, that general was Castanos himself.

Leckinski was perfectly aware that he was lost, if suspected to be a Frenchman. Consequently he immediately resolved within himself not to utter a syllable of French, and to speak only Russian and German, which latter language he could speak with facility. The angry imprecations of the troops, who conducted him to Castanos, sufficiently convinced him of the fate that would await him should he be discovered. The horrible death of General René, who only a few weeks previously had perished in torture for no other offence than that of attempting to join Junot, might well have shaken his fortitude. Death itself may be braved, but to meet it by a refinement of torture is more than the bravest man can contemplate with indifference.

"Who are you?" said Castanos, addressing the Pole in French, which he spoke with perfect fluency, having been educated at Sorrèze.

Leckinski looked steadfastly at his interrogator, made a sign, and replied in German, "I do not understand."

Castanos himself understood and spoke German; but apparently not wishing to take an active part in the business, he called one of the officers of his staff, by whom the examination was continued. The young Pole gave his answers alternately in Russian and in German; and kept himself cautiously on his guard, against dropping a single word of French. He had no easy part to play, for in the little apartment in which the examination took place, he was pressed upon by a crowd of persons, all thirsting for his blood, and manifesting a ferocious eagerness that he might be found guilty—that is, declared to be a Frenchman.

This furious excitement was increased by a circumstance which threatened to involve the unfortunate young man in inextricable difficulty. An aide-de-camp of Castanos, (one of those fanatical patriots so numerous in the Spanish war,) who from the moment of Leckinski's arrest had declared him to be a French spy, rushed into the room in which the examination was going on, holding by the arm a peasant, dressed in a brown jacket, and high crowned hat, surmounted by a red feather. Having worked his way through the crowd, the officer placed the peasant before the Polish officer. "Look at that man," said he, "and then inform us, whether he is either a German, or a Russian.—He is a spy, I would swear by my salvation," continued he, stamping his foot furiously on the ground.

The peasant, for a few moments, gazed steadfastly at the young Pole; then his dark eye kindled, and with a bitter expression of fury and hatred, he exclaimed,—"*Es un Frances!—Es un Frances!*"

He related that a few weeks previously he had been to Madrid, to convey some hay; having, in common with all the inhabitants of his village, been required to carry forage to the barracks. "I knew this man," continued the peasant, "he is the same to whom I delivered the forage, and who gave me the receipt for it. I stood beside him for nearly an hour, and I know his face well. When I saw him arrive, I said to my comrades, that is the French officer to whom I delivered my forage."

Castanos probably saw the truth; but he was a noble and generous enemy. It was not by wantonly spilling blood, that he wished to cement the edifice of Spanish liberty, which would have risen gloriously and durably, had it been left to the management of such men as himself, Romana, Palafox, &c. Castanos possibly perceived that the prisoner was not a Russian, but he dreaded the cruel treatment to which he would be exposed if he were discovered to be a Frenchman. He suggested that he should be allowed to continue his journey; but at this a hundred menacing voices were raised.

"But," asked Castanos, "would it be prudent to expose ourselves to the risk of a rupture with Russia, whose neutrality we have so earnestly solicited?"

"No," replied the officers; "but let it be proved that this man is really a Russian."

Leckinski heard all this, for he understood Spanish. He was led out and locked up in a miserable chamber, which resembled a dungeon in the most fearful days of the inquisition.

At the moment of his arrest, Leckinski had not tasted food since the afternoon of the preceding day, and when the door of his prison closed upon him, eighteen hours had elapsed since he had partaken of any nourishment. Add to this, the fatigue and anxiety he had suffered

in the interval, and it cannot be matter of surprise that he threw himself in a state of utter exhaustion on a mattress, which lay on the ground, in one corner of his prison.

He had been asleep about two hours, when the door of the chamber slowly opened, and some one softly approached his couch. A hand was held before the flame of the lamp, to shade the light from his eyes; and when the hand was withdrawn, Leckinski felt some one tap him on the shoulder; and a sweet toned female voice uttered the words, "*Voulez-vous souper ?*"

The young Pole, who was suddenly roused from his slumber by the glare of light, the contact of the hand, and the words of the young female, raised himself on his couch, and with his eyes scarcely opened, exclaimed in German, "What do you say?"

"Send him his supper," said Castanos, on hearing the result of this first trial, "and then saddle his horse, and let him continue his journey. He is not a Frenchman. How could he have kept on the mask, when thus taken by surprise? The thing is impossible."

But Castanos did not exercise undivided authority. Leckinski's supper was sent to him, it is true, but he continued in his dungeon till morning. He was then conducted to a place, whence he could see the mutilated bodies of ten Frenchmen, who had been brutally massacred by the peasantry of Truxillo. There, for the space of a whole day, he was left to contemplate death in its most horrible form. He was surrounded by snares—watched by ears and eyes, eager to catch at any unguarded word or gesture. At length, at the expiration of several hours of cruel trial, he was reconducted to his prison, to reflect at leisure on the horror of his situation.

"Gentlemen," said General Castanos to his brother officers, "I am as fully sensible as you of the importance of preventing communication between the different French commanders, at present in Spain; but in the position in which this officer stands, we cannot treat him as a spy, on the mere assertion of a peasant. The man may be mistaken. He may be deceived by a resemblance; and in that case, we should be murderers. That is not the character in which we ought to show ourselves."

It was a cheering relief to Leckinski, to return to his prison. For nearly twelve hours he had before his eyes gibbets and mutilated bodies. Though his mind was haunted by horrid images, and gloomy forebodings, he nevertheless fell into a profound sleep, for exhausted nature demanded repose. Amidst the dead slumber, in which all his senses were lulled, the door again softly opened, a female form approached his couch, and the same sweet voice which had addressed him on the previous night, said in a half whisper, "Rise, and follow me—you are saved—your horse is waiting."

At the words, "you are saved," Leckinski

started up, and immediately recovering his presence of mind, he replied as he had before done, in German, by the question, "What do you say?"

On being informed of the result of this new temptation, Castanos urged his immediate liberation; but his wish was again overruled.

Leckinski passed another miserable night. At day-break next morning he was awakened by four men, one of whom was the peasant who alleged he had seen him at Madrid. They had come to conduct him before a sort of court, composed of the officers of Castanos's staff. They addressed to him the most bitter menaces; but, firm in his resolution, he appeared not to understand a word they said.

When arraigned before his judges, he inquired, in German, for his interpreter. The latter was brought in, and the examination commenced.

He was asked what was the object of his journey from Madrid to Lisbon. He replied by showing the despatches from the Russian ambassador to Admiral Siniavin, and his passport; but for the unfortunate rencontre with the peasant, who had seen him at Madrid, these proofs would doubtless have been satisfactory. However, the young Pole firmly adhered to the account he had first given of himself, and never prevaricated in his answers.

"Ask him," said the president of the committee, "whether he is friendly to the Spaniards, since he says he is not a Frenchman."

The interpreter translated the question. "Yes, doubtless," replied Leckinski, "I love and respect the noble character of the Spaniards, and I wish your nation and mine were both united."

"Colonel," said the interpreter, "the prisoner says he hates us, because we carry on war like banditti; and he would like to see the whole nation united in one man, that he might annihilate it at a single blow."

Whilst these words were uttered, the eyes of the whole assembly attentively watched the expression of the prisoner's countenance, to see what effect would be produced by the infidelity of his interpreter. He stood unmoved. Leckinski was prepared for every trial, and was on his guard against the snare. "Gentlemen," said General Castanos, who was present at the examination, "it appears to me that there is no ground of suspicion against this young man; and therefore he must be set at liberty, and allowed to pursue his journey."

Accordingly his arms and despatches were restored to him, and the brave young Pole thus triumphantly passed through a series of trials which required almost superhuman fortitude and presence of mind.

He arrived safely in Lisbon, and fulfilled his mission, and wished to return to Madrid; but Junot would not suffer him again to expose himself to the dangers he had so miraculously escaped—"Memoirs of the Duchess D'Abrantes."

THE BATHS OF PFEFFERS.

[The following account of these celebrated baths— noted alike for the salubrious qualities of their waters as well as for the scenery which surrounds them—is extracted from a recent interesting work on the "Economy of Human Health," by Dr. James Johnson.]

As the ancient Romans sent their hypochondriacs to Egypt for change of air and scene, and as the rail-roads and steamers are not yet established between the Thames and the Nile, I shall here give a short description of one of the most curious localities which I have ever beheld in all my perambulations, and which I would strongly recommend hypochondriacal and nervous invalids to visit, while traversing the Alpine territories in search of health. It is the baths of Pfeffers, in the Grison country, not far from the Lake of Wallenstadt, which, in itself, presents most stupendous scenery. Having procured five small and steady horses, accustomed to the locality, a party of three ladies and two gentlemen started from the little town of Ragatz, on a beautiful morning in August, and commenced a steep and zigzag ascent up the mountain, through a forest of majestic pines and other trees. In a quarter of an hour we heard the roar of a torrent, but could see nothing of itself, or even its bed. The path, however, soon approached the verge of a dark and tremendous ravine, the sides of which were composed of perpendicular rocks, several hundred feet high, and at the bottom of which the Tamina, a rapid mountain-torrent, foamed along, in its course to the valley of Sargans, there to fall into the Upper Rhine. The stream, itself, however, was far beyond your view, and was only known by its hollow and distant murmur. The ascent, for the first three miles, is extremely fatiguing, so that the horses were obliged to take breath every ten minutes. The narrow path (for it is only a kind of mule-track) often winded along the very brink of the precipice on our left, yet the eye could not penetrate to the bottom of the abyss. After more than an hour of toilsome climbing, we emerged from the wood, and found ourselves in one of the most picturesque and romantic spots that can well be imagined. The road now meanders through a high but cultivated region, towards the village of Valents, through fields, gardens, vineyards, and meadows, studded with chaumières and chalets, perched fantastically on projecting ledges of rock, or sheltered from the winds by tall and verdant pines. The prospect from Valents, or rather from above the village, is one of the most beautiful and splendid I have any where seen in Switzerland. We are there at a sufficient distance from the horrid ravine to contemplate it without terror, and listen to the roaring torrent thundering unseen along its rugged and precipitous bed. Beyond the ravine we see the monastery and village of Pfeffers, perched on a high

and apparently inaccessible promontory, over which rise Alpine mountains, their sides covered with woods, their summits with snow, and their gorges glittering with glaciers. But it is towards the east that the prospect is most magnificent and varied. The eye ranges with equal pleasure and astonishment over the valley of Sargans, through which rolls the infant Rhine, and beyond which the majestic ranges of the Rhetian Alps, ten thousand feet high, rise one over the other, till their summits mingle with the clouds.

Among these ranges the Scissa-Plana, Angstenberg, the Flesch, (like a gigantic pyramid,) and, in the distance, the Alps that lower round Feldkirch, are the most prominent features. During our journey to the baths, the morning sun played on the snowy summits of the distant mountains, and marked their forms on the blue expanse behind them, in the most distinct outlines. But on our return in the afternoon, when the fleecy clouds had assembled in fantastic groups, along the lofty barrier, the reflections and refractions of the solar beams threw a splendid crown of glory round the icy heads of the Rhetian Alps, changing that "cold sublimity" with which the morning atmosphere had invested them, into a glow of illumination which no pen or pencil could portray. To enjoy the widest possible range of this matchless prospect, the tourist must climb the peaks that overhang the village, when his eye may wander over the whole of the Grison Alps and valleys, even to the Lake of Constance. From Valents we turned abruptly down towards the ravine, at the very bottom of which are the baths of Pfeffers.

The descent is by a series of acute and precipitous tounesquets, requiring great caution, as the horses themselves could hardly keep on their legs, even when eased of their riders.

At length we found ourselves in the area of a vast edifice, resembling an overgrown factory, with a thousand windows, and six or seven stories high. It is built on a ledge of rock that lies on the left bank of the Tamina torrent, which chafes along its foundation. The precipice on the opposite side of the Tamina, and distant about fifty paces from the mansion, or rather hospital, rises five or six hundred feet, as perpendicular as a wall, keeping the edifice in perpetual shade, except for a few hours in the middle of the day. The left bank of the ravine on which the hospital stands, is less precipitous, as it admits of a zigzag path to and from the baths.

The *locale*, altogether, of such an establishment, at the very bottom of a frightful ravine, and for ever chafed by a roaring torrent, is the most singularly wild and picturesque I had ever beheld; but the wonders of Pfeffers are not yet even glanced at.

From the western extremity of this vast asylum

of invalids, a narrow wooden bridge spans the Tamina, and by it we gain footing on a small platform of rock on the opposite side. Here a remarkable phenomenon presents itself. The deep ravine which had hitherto preserved a width of some hundred and fifty feet, contracts all at once into a narrow cleft or crevasse, of less than twenty feet, whose marble sides shoot up from the bed of the torrent to a height of four or five hundred feet, not merely perpendicular, but actually inclining towards each other, so that, at their summits, they almost touch, thus leaving a narrow fissure through which a faint glimmering of light descends, and just serves to render objects visible within this gloomy cavern.

Out of this recess the Tamina darts in a sheet of foam, and with a deafening noise, reverberated from the rocks within and without the crevasse. On approaching the entrance, the eye penetrates along a majestic vista of marble walls, in close approximation, and terminating in obscurity, with a narrow waving line of sky above, and a roaring torrent below. Along the southern wall of this sombre gorge, a fragile scaffold, of only two planks in breadth, is seen to run suspended, as it were, in air, fifty feet above the torrent, and three or four hundred feet beneath the crevice that admits air and light from heaven into the profound abyss. This frail and frightful footpath is continued (will it be believed?) nearly half a mile into a marble womb of the mountain. Its construction must have been a work of great difficulty and peril; for its transit cannot be made, even by the most curious and adventurous travellers, without fear and trembling, amounting, often, to a sense of shuddering and horror. Along these two planks we crept or crawled, with faltering steps and palpitating hearts. It has been my fortune to visit most of the wonderful localities of this globe, but an equal to this I never beheld. "Imagination," says an intelligent traveller, "the most vivid, could not portray the portals of Tartarus under forms more hideous than those which nature has displayed in this place. We enter this gorge on a bridge of planks, (*pont des planches*,) sustained by wedges driven into the rocks. It takes a quarter of an hour or more to traverse this bridge, and it requires the utmost precaution. It is suspended over the Tamina, which is heard rolling furiously at a great depth beneath. The walls of this cavern, twisted, torn, and split (*les parois latérales contournées, fendues, et déchirées*) in various ways, rise perpendicular, and even incline towards each other in the form of a dome; whilst the faint light that enters from the portal at the end and the crevice above, diminishes as we proceed; the cold and humidity augmenting the horror produced by the scene. The fragments of rock sometimes overhang this gangway in such a manner that the passenger cannot walk upright; at others, the marble wall recedes so much, that

he is unable to lean against it for support. The scaffold is narrow, often slippery; and sometimes there is but a single plank separating us from the black abyss of the Tamina.* He who has cool courage, a steady eye, and a firm step, ought to attempt this formidable excursion (*épouvantable excursion*) in clear and dry weather, lest he should find the planks wet and slippery. He should start in the middle of the day, with a slow and measured step, and without a stick; the safest plan is to have two guides supporting a pole, on the inside of which the stranger is to walk." We neglected this precaution; and four out of the five pushed on even without a guide at all. At forty or fifty paces from the entrance, the gloom increases, while the roar of the torrent beneath, reverberated from the sides of the cavern augments the sense of danger and the horror of the scene. The meridian sun penetrated sufficiently through the narrow line or fissure at the summit of the dome, to throw a variety of lights and of shadows over the vast masses of variegated marble composing the walls of this stupendous cavern, compared with which, those of Salsette, Elephanta, and even Staffa, shrink into insignificance. A wooden pipe, which conveys the hot waters from their source to the baths, runs along in the angle between the scaffold and the rocks, and proves very servicable both as a support for one hand while pacing the plank, and as a seat when the passenger wishes to rest and contemplate the wonders of the cavern. At about one-third of the distance inward, I would advise the tourist to halt, and survey the singular locality in which he is placed. The inequality of breadth in the long chink that divides the dome above, admits the light in very different proportions, and presents objects in a variety of aspects. The first impression which occupies the mind is caused by the cavern itself—without reflection on the portentous convulsion of nature which split the marble rock in twain, and opened a gigantic aqueduct for the mountain torrent.† After a few minutes' rumination on the action of subterranean fire, our attention is attracted to the slow but powerful operation of water on the solid parietes of this infernal grotto. We plainly perceive that the boisterous torrent has, in the course of time, and especially when swelled by rains, caused wonderful changes both in its bed and its banks. I

* "Le pont est étroit, souvent glissant, et quelquefois on n'est séparé que par une seule planche du noir abîme de la Tamina.

† It is surprising that the author of the "*Voyage Pittoresque en Suisse*," and even Dr. Ebell, should have been led into the monstrous error of imagining that the torrent of the Tamina had, in the course of ages, hollowed out of the marble rock this profound bed for itself. We might just as well suppose that the bed of the Mediterranean had been scooped out by the waters of the Hellespont, in their way from the Black Sea to the Atlantic. The mountain was rent by some convulsion of nature, and apparently from below upwards, as the breadth at the bed of the Tamina is far broader than the external crevice above.

would direct the attention of the traveller to a remarkable excavation formed by the waters on the opposite side of the chasm, and in a part more sombre than usual, in consequence of a bridge that spans the crevice above, and leads to the convent of Pfeffers. This natural grotto is hollowed out of the marble rock to the depth of thirty feet, being nearly forty feet in width, by twenty-six feet in height. It is difficult not to attribute it to art; and as the whole cavern constantly reminds us of the Tartarean regions, this beautifully-vaulted grotto seems to be fitted for the throne of Pluto and Proserpine; or, perhaps, for the tribunal of Rhadamanthus and his brothers of the bench, while passing sentence on the ghosts that glide down this Acheron or Cocytus; for had the Tamina been known to the ancient poets, it would assuredly have been ranked as one of the rivers of hell.

One of the most startling phenomena, however, results from a perspective view into the cavern when about midway, or rather less, from its portal. The rocky vista ends in obscurity, but gleams and columns of light burst down in many places from the meridian sun, through this "palpable obscure," so as to produce a wonderful variety of light and shade, as well as of bas-reliefs, along the fractured walls. While sitting on the rude wooden conduit before alluded to, and meditating on the infernal region upon which I had entered, I was surprised to behold, at a great distance, the figures of human beings, or their shadows, (for I could not tell which,) advancing slowly towards me, suspended between heaven and earth, or, at least, between the vault of the cavern and the torrent of the Tamina, without any apparent pathway to sustain their steps, but seemingly treading in air, like disembodied spirits. While my attention was rivetted on these figures they suddenly disappeared, and the first impression on my mind was, that they had fallen and perished in the horrible abyss beneath. The painful sensation was soon relieved, by the re-appearance of the personages in more distinct shapes, evidently composed of flesh and blood. Again they vanished from my sight; and, to my no small astonishment, I beheld their ghosts or their shadows advancing along the opposite side of the cavern. These, and many other optical illusions, were caused, of course, by the peculiar nature of the locality, and the unequal manner in which the light penetrated from above into this sombre chasm.

Surprise was frequently turned into a sense of danger, when the parties advancing and retreating met on this narrow scaffold. The "laws of the road" being different on the continent from those in old England, my plan was to screw myself up into the smallest compass, close to the rock, and thus allow passengers to steal by without opposition.

We found that comparatively few penetrated

to the extremity of the cavern and the source of the *Thermæ*, the majority being frightened, or finding themselves incapable of bearing the sight of the rapid torrent under their feet, without any solid security against precipitation into the infernal gulf. To the honour of the English ladies, I must say that they explored the source of the waters with the most undaunted courage, and without entertaining a thought of returning from a half-finished tour to the regions below.*

Advancing still further into the cavern, another phenomenon presented itself, for which we were unable to account at first. Every now and then we observed a gush of vapour or smoke (we could not tell which) issue from the further extremity of the rock on the left, spreading itself over the walls of the cavern, and ascending towards the crevice in the dome. It looked like an explosion of steam; but the roar of the torrent would have prevented us from hearing any noise if such had occurred. We soon found, however, that it was occasioned by the rush of vapour from the cavern in which the Thermal source is situated, every time the door was opened for the ingress or egress of visitors to and from this natural vapour-bath. At such moments the whole scene is so truly Tartarean, that had Virgil and Dante been acquainted with it, they need not have strained their imaginations in portraying the ideal abodes of fallen angels, infernal gods, and departed spirits; but painted a Hades from nature, with all the advantages of truth and reality in its favour.

Our ingress occupied nearly half an hour, when we found ourselves at the extremity of the parapet, on a jutting ledge of rock, and where the cavern assumed an unusually sombre complexion, in consequence of the cliffs actually uniting, or nearly so, at the summit of the dome. Here, too, the Tamina struggled, roared, and foamed through the narrow, dark, and rugged gorge, with tremendous impetuosity and deafening noise, the sounds being echoed and reverberated a thousand times by the fractured angles and projections of the cavern. We were now at the source of the *Thermæ*. Ascending some steps cut out of the rock, we came to a door, which opened, and immediately enveloped us in tepid steam. We entered a grotto in the solid marble, but of what dimensions we could form no estimate, since it was dark as midnight, and full of dense and fervid vapour. We were quickly in an universal perspiration.

The guides hurried us forward into another grotto still deeper in the rock, where the steam was suffocating, and where we exuded at every pore. It was as dark as pitch. An owl would not have been able to see an eagle within a foot

* This has not always been the case: the talented authoress of "*Reminiscences of the Rhine*," appears to have lacked courage for this enterprise, though her beautiful daughters advanced to the further extremity of the gorge.

of its saucer eyes. We were told to stoop and stretch out our hands. We did so, and immersed them in the boiling, or at least, the gurgling source of the Pfeffers. We even quaffed at this fountain of Hygeia.

Often had we slept in damp linen, while travelling through Holland, Germany, and Switzerland. We had now, by way of variety, a waking set of teguments saturated with moisture *ab interno*, as well as *ab externo*, to such an extent, that I believe each of us would have weighed at least half a stone more at our exit than on our entrance into this stew-pan of the Grison Alps.

On emerging into the damp, gelid, and gloomy atmosphere of the cavern, every thing appeared of a dazzling brightness after our short immersion in the Cimmerian darkness of the grotto.

The transition of temperature was equally as abrupt as that of light. The vicissitude could have been little less than fifty or sixty degrees of Fahrenheit in one instant, with all the disadvantage of dripping garments. It was like shifting the scene, with more than theatrical celerity, from the Black Hole of Calcutta to Fury Beach, or the snows of Nova Zembla. Some of the party, less experienced in the effects of travelling than myself, considered themselves destined to illustrate the well-known allegory of the discontented, and that they would inevitably carry away with them a large cargo of that which thousands come here annually to get rid of—rheumatism. I confess that I was not without some misgivings myself on this point, seeing that we had neither the means of changing our clothes or of drying them, except by the heat of our bodies in the mountain breeze. The goddess of health, however, who is nearly related to the genius of travelling, preserved us from all the bad consequences,

thermometrical and hygrometrical, of these abrupt vicissitudes.* We retrograded along the narrow plank that suspended us over the profound abyss with caution, fear, and astonishment. The Tamina seemed to roar more loud and savage beneath us, as if incensed at our safe retreat. The sun had passed the meridian, and the gorge had assumed a far more lugubrious aspect than it wore on our entrance. The shivered rocks and splintered pinnacles that rose on each side of the torrent, in gothic arches of altitude sublime, seemed to frown on our retreating footsteps, while the human figures that moved at a distance along the crazy plank, before and behind us, frequently lost their just proportions, and assumed the most grotesque and extraordinary shapes and dimensions, according to the degree of light admitted by the narrow fissure above, and the scarcely discernible aperture at the extremity of this wondrous gorge. The Tamina, meanwhile, did not fail to play its part in the gorgeous scene, astounding the eye by the rapidity of its movements, and astonishing the ear by the vibrations of its echoes. It seemed to growl more furiously as we receded from the depths of the crevasse.

At length we gained the portal, and, as the sun was still darting his bright rays into the deepest recesses of the ravine, glancing from the marble rocks, and glittering on the boiling torrent, the sudden transition from Cimmerian gloom to dazzling daylight, appeared like enchantment. While crossing the trembling bridge, I looked back on a scene which can never be eradicated from my memory.

It is the most singular and impressive I have ever beheld on this globe; and compared with which, the Brunnens are "bubbles" indeed.

REVIEW.

The Works of the Rev. David M'Nicoll, including his Poetical Remains; to which are prefixed Memoirs of his Life and Writings. By the REV. JAMES DIXON.

We agree with Mr. Dixon, that "biography ought to be a faithful portrait of the departed—to speak his language, and to exhibit his opinions;" and he has judiciously adhered to the principle thus laid down. Whatever he could collect of such fragments as could be met with illustrative of the mental powers, the religious experience, and the ministerial labours of the eminent individual whose Memoirs he undertook to prepare, he has furnished.

Mr. M'Nicoll was a highly acceptable Methodist Preacher, and of very superior endowments among a class of religious teachers who, under all possible disadvantages for mental culture, and classical, and even theological, education, have, by industry and determined perseverance, made themselves respectable, while a few have risen to considerable literary eminence. The Memoirs of Mr. M'Nicoll will be highly valued by his friends and the connexion in which he

moved with so much honour and usefulness; and this uniform edition of his collected works, possesses an intrinsic value which will strongly recommend it to the public. His "Essay on Covetousness" well deserves a place among some of the very best that have recently appeared, and we trust that the subject will make as deep an impression among the great body to which Mr. M'Nicoll belonged, as it is now generally making throughout the Christian world. In his rational inquiry concerning the operation of the stage on the morals of society, as his object was precisely similar, and many of his positions almost identical with a popular essay on the same subject, and still in circulation, we cannot but express ourselves surprised, that Mr. M'Nicoll should have altogether neglected to

* This circumstance illustrates, in a very remarkable manner, the effects of passing from a hot or vapour bath into cold air or water, the immunity is nearly certain. The hotter the medium from which we start into the cold, the less danger there is of suffering any inconvenience. This principal in Hygeia is more understood than practised.

notice it—especially when he refers to a Review in which it was severely handled. We cannot think that the Essay in question is at all inferior to that of Mr. M'Nicoll, while its style is far superior, because more popular. The "Essay on Taste," is written with spirit and elegance. The following we quote as an example:—

"The influence of taste in modifying the moral and religious principle, may be conceived from its intimate connexion with every other power of the mind, or state of the heart; and from the strength which it exerts in the calm, but constant, pursuit of its designs, operating with the undisturbed and imperceptible procedure of an under-current, as broad and as rapid as the surface which conceals it. Taste is a high sense of beauty, in all its kinds and aspects, and may be the medium of a powerful attraction. Besides, it implies a corresponding aversion to objects in which the absence of beauty, or the violation of its principles, is manifest. And how, in both these views, the passions and pursuits of men may be influenced, requires no very elaborate description or proof.

"What a multitude of delightful contemplations and emotions concur in a single instance of tasteful enjoyment! Let that instance be a park or landscape. The forms and colours possess an intrinsic beauty, independent of every other consideration,—a charm that strikes the inward sense with a lively but inexplicable pleasure. For, by the way, we may observe, that the usual theories of association account only for a part of the pleasure of which material beauty is an occasional cause. Thus music, as a composition, may be clearly explained, while the question, why single notes delight the ear, puts to silence the inquiry. If spring be the season, novelty supplies an additional charm to the whole; for the summer green, though equally fresh and vivid, is not equally interesting with that of spring, simply because it is not possessed of novelty. Should this have been the scene of our youthful days and friendships, now seen after an absence of many years; should it present such natural features, and buildings, and statues as lead the imagination back to classical antiquity; should it stand connected with some striking portions of our own national history or literature; or should we recognise in the woods, and streams, and in the colours of the sky, a perfect resemblance of the finest landscape-painting which we have been used to admire,—association, it is evident, would greatly swell the tide of pleasure. Other details might be added, but these will serve to show how the impression may be heightened according to the number, and quality, and harmony of the principles which the case may chance to include. And what a concentration of attractions may thus impress and sway the heart, and, through this medium, the reason and moral feelings of the individual!

"Thus the man of taste possesses more of enjoyment than any other person. He has not only a peculiar perception of the most obvious and common charms, he also discovers an infinity of finer beauties, which escape the notice of mankind in general. And should his taste be highly cultivated, he enjoys the pleasures of a critical understanding, which marks the reasons of the case, in addition to those of a delighted sensibility. And should this taste at the same time introduce the mind—which not unfrequently occurs—to noble trains of imaginative thinking, to sympathetic emotions, and to moral contemplations and excitements, a banquet must be provided for the happy favourite the most rich and enviable, and which—still presuming that his heart is virtuous—can scarcely fail to throw the whole soul into an element and attitude the most favourable to the best unfoldings of the moral character. The inanity and sluggishness of a grosser state are gone, and the free spirit is prepared to run its career of moral excellence with renovated vigour.

"The pleasure itself thus enjoyed, apart from its tendencies, has, in its own nature,—should no reason appear against it,—a reason in its favour, since pleasure is, no doubt, a principal end of our existence. Bishop Berkeley must have been one of the happiest as well as richest of men, when he regarded all the fine seats which he visited as his own. 'The same,' he says, 'I think of the groves where I walk. In a word, all that I desire is the use of things, let who will have the keeping of them.' The same may be said of company, and reading, and all the innumerable sources of tasteful enjoyment with which our life is enriched. To renounce all this, without a reason, is like fancying that some meritorious penance lies simply in the choice of pain in preference to pleasure,—in leaving the level pathway to church, for the difficult and offensive mire.

"The connexion, also, of taste with displays of human character is obvious and most important. If material objects derive their beauty, in some degree, from their association and analogy with mind, then mind itself must be still more beautiful. On this subject the poets are peculiarly competent to judge; and their chief care, when the art is properly employed, is to excite admiration, as well as sympathy, by the loftiest and grandest exhibitions of virtue. Besides: Their own delicate sense of this kind of excellence is often warmly expressed:—

'Is aught so fair

In all the dewy landscapes of the spring,
In the bright eye of Hesper, or the morn,
In nature's finest forms,—is aught so fair
As virtuous friendship? as the candid blush
Of him who strives with fortune to be just!

The graceful tear that streams for others' woes?
Or the mild majesty of private life,
Where peace with ever-blooming olive crowns
The gate? where Honour's liberal hands diffuse
Unenvied treasures, and the snowy wings
Of innocence and love protect the scene!

"The same doctrine appears to be recognised by St. Paul, when he represents the modesty, sobriety, and good works of the woman under the notion of her ornaments, and, when speaking of the virtues, he employs the terms 'whatever things are lovely.' And partly for this very reason the virtues are called 'graces.' The man of taste must, therefore, possess a great advantage in the contemplation of either good or bad character. He can enter more fully into the spirit of his subject, at least as regards its beauty or deformity, and may, therefore, be expected—other circumstances being equal, as aforesaid—to admire and love the virtues, and to hate all vice as odious and disgusting, in a degree corresponding with his better light and feeling. He will enjoy the living picture of beneficence, and be himself the more beneficent; the beauty of a grateful character will touch his sensibility, and dispose him to be grateful; and, delighted with the view of virtuous conduct in others, he will be led, from a sense of interest, to exercise a Christian love and charity for all men. Thus the virtues he contemplates will be reflected by himself, with the added grace of his own tasteful accomplishments, as the foliage on the banks of a river seem softened in the shining stream. That is to say,—for we must never forget it,—that where Christianity has previously impressed its superhuman principles upon the heart, taste will thus be found an admirable means of religious improvement, just as a critical acquaintance with the Scriptures may be turned to spiritual advantage in the experience of the man who, independent of this knowledge, is possessed of a spiritual disposition."

The Poetry of this volume is not much to our taste.
The best specimen in the collection is:—

MORE THAN MEETS THE EYE.

"I love the dawns of the beautiful,
The budding rose, the earliest green of spring,
The sun just entering heaven's rich vestibule,
The soonest lark when first she mounts her wing,
And the young moon at eve, whose virgin face,
Side-long reveal'd, shines with a modest grace.

Shall these give pleasure to the glowing sense,
But to the soul yield nothing more refined?
Nothing of purer touch, to recompense
The busy wonderings of the searching mind?
Yes; hues and forms are but the mystic wand
That starts the visions of her fairy land.

For 'more than meets the view' lies in the bloom;
The fruitage of a distant day shines there.
Twice charm'd we see the pent flower burst its tomb;
Twice, as when from the harp, swept by the air,
A soft, sweet note seems sounding from on high,
That with a deeper note chimes harmony.

Thus lovelier than the beauty of her smiles,
The opening virtues rise of heaven-taught youth.
Behold, they come, first of their lengthening files,—
Sincerity, devotion, love, and truth;
Like waves that break and sparkle on the shore,
Sounding th' advance of many thousands more.

But O, my child, should folly blast thy flower,
Like snow in summer, it would chill my soul;
'T would seem like sunset at the noontide hour;
As if the last sweet song had ceased to roll;
As if the waxing proved a waning moon;
Or Heaven in wrath resumed some matchless boon!

O no! I must not fear it; God will guide
Thy bless'd career of sanctity and joy.
The lustre of thy spring can never hide
The mellow harvest which my hopes employ;
And still I see immortal growths lie there,
In still-surpassing forms of good and fair.

Bright from the Maker's hand glowed earth and sky;
Man looked astonishment, and joy, and love.
Again he mused, and 'more than meets the eye'
Was traced on all, was sung through every grove.
Then rose the eagle-vision of his soul,
Scanning th' eternal purpose of the whole.

But soon a storm of crime and curse began,
Dashing the inscription from its monument;
Nay, struck the mind, and left erroneous man
To know his world, but not its true intent.
Then, as the darkness thickened to its height,
God spake once more,—and there was glorious light.

Thrice blessed light! whose many streams have found
A central sea in God's own truth reveal'd;
Whose cloudless ray can pierce the dark profound,
Where Providence her secrets has conceal'd;
Unsound depths beneath the surface lie,
More than can ever meet a scraph's eye.

See, 'I am thine!' Who yet has understood
The illimitable sense of these brief sounds!
Writ by the pen of God, confirm'd with blood
Drawn from his own inimedicable wounds:
In these small, charmless characters is given
The eternal charter of our highest heaven.

How small to sense!—a touch conceals the line;
To faith how more than infinite the taught!
Dead of Adeptive Love; seal'd by Divine,
By rapturous joy, that sets earth's joys at nought;
A gem whose ray now lights this cave of care,
Whose price in heaven will purchase kingdoms there.

O do not scorn the ungraceful type that stains
With misty hue its dark and tatter'd page:
Read me the words, I envy not the strains
Of every Orpheus of this tuneful age.
Show me the line, and let a Newton fly
Enraptured through his planetary sky.

Then look, my soul, not on the narrow field
Of this low weedy world; lift up thine eye;
Pursue the ever-lengthening vale; and yield
Thy homage to the mountains; there descry,
At every new ascent, still nobler heights,
Feasting thy hopes with infinite delights.

These give celestial temper to the soul,
To meaneat things of earth a sweep sublime;
Urge us to rush upon the eternal goal,
Till Death himself shall die, and hoary Time
Take youth's bright form, his night turn into day,
Dwell in new worlds, and cast his wings away."

LIFE AND MANNERS.

ROMILLY.—M. Dumont, in his "Recollections of Mirabeau," the leading orator of the French revolution, thus describes the persevering industry of our illustrious countryman Sir Samuel Romilly:—"Romilly, always tranquil and orderly, has an incessant activity; he never loses a minute; he applies all his mind to what he is about. Like the hand of a watch, he never stops, although his equal movements in the same way almost escape observation."

COOKERY.—Two talented gentlemen now living, and rising into merited estimation, were, in their early days, residing in London for the sake of learning the business of a great establishment there. They practised, for several years, a system of diet by which they lived at a small expense, on a food which appears to have been nourishing and agreeable. Animal food,

cut into small pieces, will give flavour to a large quantity of vegetables. These young men got an oil lamp, with a feeble flame, and a tin saucepan; they mingled the small pieces of animal food with a large quantity of nourishing vegetable food; water was put in to make the stew, and the whole was left from after breakfast till dinner-time over the lamp, and was then hot and ready for their meal. On this plan they found that they could live comfortably for half-a-crown each per week. The most savoury and wholesome cookery requires the slowest fire. A sumptuous French dinner could be dressed with one-tenth of the fuel consumed by an English cook in broiling a few beef-steaks or mutton-chops.—*Dr. Ure's Philosophy of Manufactures.*

SCRAPS OF LITERATURE.

LETTERS.—Much curious speculation has been employed with regard to the invention of letters, both as to their author and the period of their invention. Many have supposed the Egyptians to have been the first nation that used them, and Thyoth of Pathrusim to have been their inventor. Others have supposed them to have been invented prior to the deluge, and to have been transmitted by Noah to his posterity. We think it a sufficient confutation of the latter opinion, that the descendants of Noah did not all understand the use of letters till they learned them a long time after the deluge; whereas there is no reason to suppose they would have lost the use of them had they been acquainted with them. In support of the other opinion, viz.; that letters had their origin in Egypt, there is no inconsiderable evidence. Pliny, while he attributes their origin to another source, acknowledges that others ascribe their authorship to the Egyptians, making Mercury their inventor. Diodorus, Plutarch, Cicero, Tertullian, and Plato, were of the same opinion. Kircher describes the very shape of the letters which he invented. Philo-Bibulus, the translator of Sancho-nisthon's history, quoted by Eusebius and Porphyry, mentions the commentaries of Taautus, or Thyoth and the sacred letters in which he wrote his books. Jamblicus speaks of a vast number of books by this same Taautus. And all antiquity agrees that the use of letters was very early in Egypt, and that Thyoth or Mercury was the first who used them. Now if Thyoth i. e. Pathrusim, the son of Misraim and grandson of Ham was the first in Egypt who used letters, we think he must have been their inventor. For it is not supposable that letters would not have been used before, had they been known. We must therefore conclude, from the tenour of all the evidence before us,

that letters were invented by Pathrusim the grandson of Ham; and that mankind are indebted to Egypt for this invaluable blessing. The idea that letters must have been known before the deluge, because there are certain short Antediluvian annals, finds a ready confutation in the fact of the great age of the Antediluvians, by which means the history of those times could be transmitted orally from the father to the son, by passing through very few hands; also in the fact, that annals can be preserved by symbols and hieroglyphics.

GEOMETRICAL CLASSIFICATION OF THE ALPHABET.

Straight and curve lines.

J D P B R R Z .

THE GEOMETRICAL ALPHABET.

The letters are just twenty-six;
Of sounds they are the signs;
We have a rule their forms to fix,
By circles, angles, lines.

The O and Q and C and G .
Are circles turning round;
X, W, M, Y, A, N, V,
Sharp angles will be found.

Of different lines the rest are made,
Some straight and curv'd you'll see;
If good attention should be paid,
You'll soon learn A, B, C.

There's horizontal and upright,
And some are parallel;
You'll learn their forms almost at sight,
If angles you can tell.

The circles first we'll try to learn,
Of these there are but four;
Then seven angles come in turn,
That's more than half a score.
Ten more and five, all that remain,
Have straight and curved lines:
Our rule you'll find is very plain,
"THE LETTERS ARE THREE KINDS."

There's angles *sharp*, with lines that *slope*,
Round circles, lines all *straight*;
You'll learn them all quite soon, I hope;—
You'll not have long to wait.

This alphabet is to be taught by the use of the Black board, writing the letters according to their classification, and requiring the children to name them, and illustrating their forms in the same manner, by explaining the geometrical figures, viz:—circles and angles.

LANGUAGES FORGOTTEN.—Cases are recorded of the forgetfulness of a language constantly spoken, while one nearly forgotten from want of practice was recovered. A patient in St. Thomas's Hospital, who had been admitted with a brain fever, on his recovery spoke an unknown language to his attendants. A Welsh milkman happened to be in the ward, and recognised his native dialect; although the patient had left Wales in early youth, had resided thirty years in England, and had nearly forgotten his native tongue. Boerhaave relates a curious case of a Spanish poet, author of several excellent tragedies, who had so completely lost his memory in consequence of an acute fever, that he not only had forgotten the languages he had formerly cultivated, but even the alphabet, and was obliged to begin again to learn to read. His own former productions were shown to him, but he could not recognise them. Afterwards, however, he began once more to compose verses, which bore so striking a resemblance to his former writings, that he at length became convinced of his being the author of them.

GEMS.

PRAYER.—Prayer is not a smooth expression, or a well contrived form of words, not the product of a ready memory, or a rich invention exerting itself in the performance. These may draw the best picture of it, but still the life is wanting—the motion of the heart Godwards. Holy and divine affection makes prayer real and lively, and acceptable to the living God, to whom it is presented; the pouring out of the heart to him who made it, and understands what he speaks, and how it is affected on calling on him. It is not the gilded paper and good writing of a petition that prevails with a king, but the moving sense of it. And to the King who discerns the heart—heart-sense is the sense of all, and that which only he regards. He hastens to hear what that speaks, and takes all as nothing where that is silent. All other excellence in prayer is but the outside and fashioning of it; this is the life of it.—*Leighton*.

READERS.—Coleridge divided readers into four classes. The first he compared to an hour-glass, their reading being as the sand: it runs in, and it runs out, and leaves not a vestige behind. A second class, he said, resembled a sponge, which imbibes every thing, and returns it nearly in the same state, only a little dirtier. A third class he likened to a jelly-bag, which allows all that is pure to pass away, and retains only the refuse and the dregs. The fourth class, of which he trusted there were many among his auditors, he compared to the slave in the diamond mines in Golconda, who casting aside all that is worthless, preserved only the pure gem.

DROUGHT.—The goodness and power of God are never, I believe, so universally acknowledged as at the end of a long drought. Man is naturally a self-sufficient animal, and in all concerns that seem to lie within the sphere of his own ability, thinks little, or not at all, of the need he always has of protection and furtherance from above. But he is sensible that the clouds will not assemble at his bidding, and that,

though the clouds assemble, they will not fall in showers because he commands them. When, therefore, at last, the blessing descends, you shall hear, even in the streets, the most irreligious and thoughtless with one voice exclaim, "Thank God!" confessing themselves indebted to his favour, and willing—at least so far as words go—to give him the glory. I can hardly doubt, therefore, that the earth is sometimes parched, and the crops endangered, in order that the multitude may not want a memento to whom they owe them, nor absolutely forget the Power on which all depend for all things.—*Cowper*.

SCRIPTURE LANGUAGE IN SERMONS.—To say nothing of the inimitable beauties of the Bible, considered in a literary view, which are universally acknowledged, it is the book which every devout man is accustomed to consider as the oracle of God; it is the companion of his best moments, and the vehicle of his strongest consolation. Intimately associated in his mind with every thing dear and valuable, its diction more powerfully excites devotional feelings than any other; and when temperately and soberly used, imparts an unction to a religious discourse which nothing else can supply. Besides, is there not room to apprehend that a studied avoidance of the Scripture phraseology, and a care to express all that it is supposed to contain in the forms of classical diction, might ultimately lead to the neglect of the Scriptures themselves, and a habit of substituting flashy and superficial declamation in the room of the saving truths of the Gospel? Such an apprehension is but too much verified by the most celebrated sermons of the French; and still more by modern compositions in our own language which usurp that title. For devotional impression, we conceive that a very considerable tincture of the language of Scripture, or at least such a colouring as shall discover an intimate acquaintance with those inimitable models, will generally succeed best.—*R. Hall*.

EASTERN ABOMINATIONS.

THOUGH the substantive part of this title is now considered and used as a very strong one, yet it is not so in the original; and the original meaning is clear, whereas the secondary or stronger one is very vague. We therefore use it in the original and clear sense, which is simply that one "turns away from the augury," shuns the thing or the practice, because mischief is dreaded; and, if the dread is well founded, the fact of abominating is justifiable and wholesome. With this understanding of the word, it is our intention occasionally to notice some of the more palpable public abominations, whether at home or abroad; and in so doing we at least hope to render some small service to the cause of morality and religion.

If the abomination is found only where Christianity has not yet come in its power, then it witnesses to the value of the Christian religion generally; and if it appears only under certain forms and phases of the temporal framework of an establishment, then we have a practical groundwork for comparing that with others in which the same abomination is not to be found.

In doing this we have no wish or intention of censuring one part of the human race and praising another; for we believe that, until they "receive impressions," they are all very much alike. It is this, indeed, which alone gives us any hope of success in our attempts to improve mankind, either in knowledge or in conduct. If the distinction were inherent, born with the individuals, there would be no hope; because the character would be fixed before we could apply even the first element of our teaching. But, as all, or nearly all, depends on the impressions, and as we have the selection and control of these from the very beginning, we must share largely in the blame of those who suffer in consequence of our neglect or blundering. In practice, indeed, we manage matters somewhat differently, we veil the disposing cause and the temptation, call down the indignation of the law upon the mere instrument of the crime, (for such is often the fact,) and then give thanks "that we are not like other men:" but of this some other time; so to our present subject.

Our ultimate object is a practical demonstration of this proposition; "That wherever the Christian religion is established, and in proportion as its rites and observances approximate that simplicity and purity which were initiated and exemplified by its Divine Founder, crime is displayed wholly as human crime, and charged home upon the guilty parties, as their own personal and inexcusable act, without the plea of superstition, established custom, or any other bandage whatever wherewithal to tie up the eyes of justice."

This being borne in mind, we proceed to our proofs and illustrations. It has been sometimes

said that the Hindû superstition is an intellectual religion; and the science of the Brahmins has been appealed to as a proof. Now the only proof that science has a good origin is, the good effect which it produces on the people; and we are not aware of any thing but superstition, and superstition which a red man of the American forests would treat with ridicule, being promoted by Brahminical science.

There is hardly a crime which may not be committed with even professional regularity, and yet the perpetrator may continue a saint of the purest description. We shall select only three; THUGGEE, or systematic murder for its own sake; DACCATTEE, or midnight plunder, accompanied by murder if necessary; and DHERNA, which in effect means the defying or putting aside of the law by incantations, generally of the most revolting and horrid description—the mode is, that they are performed in cold blood, and in the full belief that the Trinitri, Brahma, Vishnu, and Siva, or some of them, or their wives and families (for they are literally household gods) will approve the deed and grant the request. At present we confine ourselves to the last mentioned:

DHERNA.

Dherna is resorted to for the purpose of enforcing or of avoiding the law; and the same form of it may, we believe, be practised for either purpose. Murder, immolation of some kind or other, is always the ultimate result pointed at; but the murder of some one connected with the practiser of the Dherna, and not the party against whom it is practised. There are three forms of it, besides some subordinate ones and modifications. For the sake of shortness, we shall call them by *Begum*, by *Brahmin*, and by *Coor*.

Begum, is generally practised to keep off the law, or to insure revenge in cases where the party is unable to take it forcibly, *vi et armis*. The women of the establishment are seized by their male friends, and the dagger is ready brandished, or the poisoned chalice prepared for each; it depending entirely on the conduct of the party against whom the menace is made, whether these shall or shall not be applied with mortal effect. If the officer of justice advances to do that which the law entitles him to do, then the murder is committed, and the punishment falls on him; and if the party that has given offence does not make the stipulated reparation, which is generally not easy, and often quite impossible, then he is in the same predicament. Persons of purer faith would defy this superstition; but it is as firmly believed in by the threatened in these cases as by the threatener; and thus the terror which it produces is great, and very often produces the effect. No conduct of a man's own can fall upon him

with half the effect which this murder is believed to have both in this world and in the next. Nothing earthly can prosper with him, or with any of his race; every disease shall assail their bodies, every mishap shall come on their possessions; and when they can bear no more, then death shall consign them over to eternal torment.

Horrible as this seems, there are still some remains of it in this country. The "evil eye," and all the other baneful influences of sorcery and witchcraft, are still believed in in some parts of the kingdom. There supernatural powers of mischief are also always ascribed to the physically feeble, to the most harmless of all human beings, aged and decrepid females. They are even given to animals. A hare, for instance, is one of the most timid of living creatures; and yet there are still places where the body or foot of a hare is more dreaded than an invading army would be; and we have known of fifty fishermen being sealed up in their houses, for an entire day, during "the prime of the fishing," by the simple circumstance of a roguish boy driving a black pig along in front of the said houses.

We have also much closer imitations of this power of Dherma than these mentioned. Half the suicides which are committed are really produced by a principle which is analogous; and the instances in which persons of ill-regulated minds and turbulent passions, threaten this sort of Dherma upon themselves are almost innumerable. The depravity which prompts this is precisely of the same kind with that which leads to the murder of another, only it is dashed with cowardice, and thus it is characteristic of a lower value of mind, or rather a more degrading species of mental misculture.

Coor is generally practised with a view of enforcing a demand of some kind or other, such as the payment of a debt, the recovery of property, or generally the satisfaction of any demand which the party making it has not the power to enforce. This, like Begum, may, we believe, be practised by all castes; though "who" shall practise either, and against "whom," is not, we believe, an open question. One of higher caste can always inform against one of lower; and, as the caste is that of the performer and not the party employing him, this is, in some instances, the only way in which a low caste Hindû can get justice at the hands of a high caste one.

Coor is a very revolting exhibition. A pile of dry and inflammable wood is built up before the door of the party operated upon; and on the top of this pile a cow or an old woman is placed—the former in the most terrible cases, in consequence of the superior sanctity of the animal. The performing party attends ready with a burning torch; and if the other does not consent to, and satisfy the demand in time, the pile is lighted, and the victim is in a moment enveloped in the flames,

without possibility of being saved. The consequences of this, especially in the case of a cow, are held to be of the most direful nature; and therefore Coor is never mentioned by a believer, but with fear and trembling, and suppression of the breath.

The *Brahmin* is also a very curious matter, though not quite so revolting to a stranger as either of the other two. Indeed, if it were not for the depth of superstition which it involves, we should be apt to see a good deal of the ludicrous in it. The ludicrous is the prevailing character of all such incantations which have not cruelty in them; at least in places and among people where nobody has any faith in them; but as the ignorant are very prone to such faith, in all ages and nations, even the innocent imitation of incantation is a very questionable means of producing mirth.

One of the modes of this form of Dherma, consists in the Dherma standing at the door with a great stone on his head, until he shall either sink under its pressure, or force the other party into a compliance with the demand for which he performs the Dherma. Among us, the fact of a man coming to stand before the door with a big stone on his head, as a means of obtaining payment of a debt, or a compliance with any other demand, would appear very absurd; but suffering voluntary pain is a great means of sanctity among the Hindûs; and any one who is, under any circumstances, the means of causing injury to one engaged in these penances is understood to suffer most unavoidably and most seriously for the same.

The most characteristic mode of this form of Dherma is that in which the Brahmin performs the operation in his own person, prepared for death certainly, and ready to inflict it on himself; but not without some act on the part of those against whom he acts. This is chiefly resorted to for the obtaining of debts due, when the debtor is such that the creditor cannot reach him by the ordinary power of the law, or when a Brahmin of high caste has *found* property belonging to others. In this case, by the law of Menu, he keeps the whole of the property, or five sixths of it; and in a country where Ducait robbery is not a very serious inroad upon that hereditary sanctity which a Brahmin derives from his birth, "found" property is by no means difficult to be obtained; and it cannot be recovered by any process in the Hindû courts.

The object here is to find a Brahmin of as high, or higher caste, than he who has the property; and this is seldom a matter of much difficulty; because, though such a Brahmin is much more sacred than a prince, he may be the most abject beggar in the village. Being found, and engaged, he provides himself with a dagger, a bowl of poison, or both; and watching till he is sure that the party is within his dwelling, he sits down before the door, with his dagger or his

poison-cup full in view ; but not one word he utters, and not a single menace does he offer to any living creature.

Still, the fact of his being there is a most serious matter. If the other party tries to escape, the Brahmin plunges the dagger into his own heart, or drinks the poison ; and in either case he very soon expires, and by so doing inflicts temporal misery and eternal damnation on the other party. Even the temporal punishment is severe enough, for there is a loss of caste, a total exclusion from present society, and no alternative but to join those outcasts whose very shadow is pollution, and who are not suffered to enter the village. This is more than can well be borne ; and therefore very few endeavour to make their escape from the Brahmin.

This leads to "the tug of war," which, in the event of a resolute debtor, or other holder of property, may last for a considerable time. The Brahmin neither eats nor drinks ; and for the master of the house to do either while a Brahmin is fasting in Dherna at the door, would be as certain and prolonged misery as the escape. The Brahmin's mercies are as those of the kind described by the satirical bard,—

"To wage fierce battle with his teeth,
And fight his stubborn guts to death."

But even though the party had bowels of iron, or powers of abstinence equal to that of a toad, it would avail him nothing. The battle of starving is not an equal one. If the man on whom the Brahmin sets dies, no harm ensues to the

Brahmin ; while the man must bear the consequences of dying in his obstinacy and his sins, without the least benefit from salgrum stone, sacred service, or cow-dung ; and therefore his case is a very hopeless one. On the other hand, if he should outstand the Brahmin, which from the abstemious habits of that caste is not to be done but by a very desperate effort, the consequences are the same as if he had, by an attempted escape, driven his holy gaoler to the use of the dagger or the poison. On earth, he loses caste, whatever that may be, and is driven to the pariahs, while there is no hope for him in the next world. Whenever, therefore, the Brahmin once takes his station at the door in Dherna, there is no means of escape for any one who is a Hindû, but by satisfying the demand if he is able, or trying to compound it if he is not.

In those parts of India which are near British influence, these practices are not now very common ; but in former times they were general ; and they are still not unfrequent in the remote parts. It is difficult to imagine a state of mental depravity more degrading than this ; and when we think of it we cease to wonder why the vast proportion of so fine a country as India, has, in all ages, been an easy prey to any warrior who dared to invade their territory. Now that the sources of internal disturbance are nearly dried up, it is to be hoped that British example, and especially the zealous and judicious introduction of Christianity, will heal many of these mental and moral diseases ; and, on many accounts, they deserve this at the hand of Britain.

HYMN AT SUNSET AMONG THE ALPS.

[We know not who is the intelligent author of these beautiful verses, but they are surely deserving of a more lasting record than among the ephemeral columns of passing criticism.]

On Thou who hast thine altar made

On every mountain's brow ;
Whose temple is the forest's shade,
Its arch, the forest's bough ;

Thou hast ever listened when we prayed,
And thou wilt hear us now.

Full kingly is thy royal grace

On the wide world poured forth ;
From the sunny-south, "in pride of place,"
To the icy-girded north ;
The glorious beauty of thy face
Doth shine upon the earth.

To each—to all—thy bounty flows,
Full, boundless, deep, and free ;
Thou hast flowers for earth, and stars for heaven,
And gems for the blue sea ;
And for us our everlasting hills,
And hearts which dauntless be.

More hast thou given, oh, God ! yet more
Than our spirits true and bold ;
And our mighty mountain sentinels,
Those watchers stern and old—
The shadow of a glorious past
Our memory doth enfold.

That little band of shepherd men,
Who left their flocks with thee,

And, strong in heart, went boldly forth

To make our mountains free—

Thy hand was with their steadfast worth,
And they won the victory.

And they, the saints of later time,

Who dwelt in places lone,
And wandering exiles for their faith,
Through toil and famine, fight and death,
Their martyr-crowns have won,—
'Twas thou received their fleeting breath,
And they sit beneath thy throne.

Forsake us not, but as of old

So let our spirits be ;
And give us still the courage bold
To keep our mountains free ;
And our ancestral faith to hold,
Wherewith we worship thee.

The cattle on a thousand hills,

The feeble and the small—
We leave throughout the silent night,
Nor fear lest harm befall ;
For thou who blest the patriarch's store,
Wilt guard and keep them all.

Praise from the mountain's lordly crest,
Praise from the valley lone,
For all our daily blessedness,
For our bright ones who are gone,
To thee, the mightiest, wisest, best,
The great eternal One !

SPECIMEN OF A NEW DICTIONARY.—No. II.

ASTROLOGY.—The ancient recipe for acquiring foresight without knowledge or reflection.

BIGOTRY.—The Typhon of the church. The parallelism between the more striking features of heathen mythology and the chief characteristics of corrupt Christianity is often startling, and remarkably illustrates the unchangeable nature of human depravity. Mark the identity of Typhon (who also rejoices in the *aliases* of Enceladus, and Typhæus) with bigotry. 1. He was a giant. 2. He was the son of Tartarus and Terra—"hell and earth." 3. He had a hundred serpent or dragon heads. 4. Flames of devouring fire darted from his eyes and mouth, and his voice resembled the yells of all discordant animals. 5. He laid snares for his peaceful, religious, and useful brother Osiris; misrepresented the nature and objects of his benevolent enterprise; poisoned the public mind against him; and murdered him at his return. 6. Jupiter was compelled to hurl his most dreadful thunderbolts in order to put him to flight. 7. But even in his vanquished and imprisoned state, the flames of Etna are his breath, and earthquakes result from his merely changing the posture of his body. 8. His emblem was a wolf and a crocodile—"hypocrisy and ferocity." To point out the resemblance between the two worthies in question, would be an insult to the reader's *organ* of comparison: it is more than a family-likeness; it is perfect identity. Bigotry is Enceladus "christened"—Typhæus in canonicals. Typhon "writ large." "Bigotry fell down and broke his leg," says Bunyan, and devoutly adds, "I wish he had broken his neck." Let us hope that his neck is yet destined for this, or some other visitation equally efficacious.

COINCIDENCES.—Who has not often been struck with the occurrence of events, each of which was quite unexpected, but the coincidence, the falling together of which at the same time, seemed to be beyond the course of nature, the bounds of probability, and the whole doctrine of contingencies? Events appear to occur in cycles. Not only do they seem to come from different quarters of the globe to the same point, but it would seem as if, at parting, they asked each other, like Macbeth's witches, "When shall we three meet again?" and as if they punctually kept their appointment; and they do this although they do not appear to be linked, or connected by the remotest affinity. And not only do individual events thus come together, but whole series, two or three distinct courses of events, do the same: not only is the fabled wheel of fortune seen—the vision of prophecy is realized—a wheel within a wheel. On this principle we believe Dr. Croly's volume entitled "Divine Providence, or the three cycles of Revelation," is constructed. His object is to raise a new evidence for the Gospel—to prove that "Christianity is the direct work of Providence,"

by showing that the leading facts of Christian history have been the leading facts of the two former dispensations, Judaism and the Patriarchal religion; and that those facts have occurred in the three, not merely in essence, but with the same purpose, and in the same order. Coincidences in ordinary life are familiar to all. We ourselves have sometimes met in the course of our reading with a strange word, or a new technical term; and before we have done wondering about it, we meet with it again, and again, and again, in three different books, and in immediate succession. We think of an early acquaintance whom we have not seen for twelve years, and scarcely thought of for twelve months—and, while he is yet in our thoughts, we meet with a friend who inquires when last we heard of him—or, on returning home, there is a letter just arrived from him. After being all our life unacquainted with some particular fact—we meet with it two or three times in conversation and reading on the same day. A discovery in science is made—the search of ages—but no sooner is it announced than two or three individuals, living in different and distant countries, appear to have made the same discovery at the same time. The great discovery respecting the nervous system by Sir Charles Bell and a Signor Carlobelli has been remarked on by others as a striking coincidence; for not only was the same discovery made simultaneously, but by two individuals whose very names, be it observed, are nearly alike. Well do we remember the way in which our attention was first directed to the doctrine of coincidences; though many other things of much greater importance, we fear, have, since then, been forgotten. We were riding with a friend through Gracechurch-street on the outside of a stage, when a person on the pavement, speaking of a man at the corner of the street, in a passion, exclaimed, "his monkey is up, however." We asked our friend the origin of the phrase; but as he was as much in the dark as ourselves we had nothing to do but to speculate about it. By the time we reached the old London-bridge we had discussed the merits of two or three hypotheses, and had dismissed them. Before we could start another, our attention was attracted by the operation of driving the piles, —visible from the top of the coach—for the erection of the new bridge. The ponderous weight belonging to the machine used for driving the piles was about to descend on a pile, when instantly it flashed on our mind that the origin of the phrase was bodily before us. Though we had never seen the machine before, we suddenly remembered that it was called "a monkey," and in the enormous weight wound up to the utmost height, and about to fall with a crushing force, we saw a vivid illustration of the reason why one is to beware of a man when "his monkey is up."

But this was not all—for, immediately afterwards, on opening a pocket Dictionary of general knowledge which we held in our hand, and which we opened without any reference to the coincidence named, the very first word that met our eye was, "Monkey—a machine used for driving large piles of wood." What a strange collection of coincidences would be found in the history of courtships and marriages!

But singular as many coincidences are, their occurrence is not unaccountable. We do not find it necessary to suppose the immediate and arbitrary interposition of Providence, on the one hand; nor, on the other, do we abandon such occurrences to chance: for we believe that, though we seem to stand amidst an infinite number of events in lawless and incessant whirl, like the dancing motes of a sunbeam, yet, like those motes, each of all these events obeys a law impressed on it by the omnipotent hand of God. The number of events that cross the path of every individual is immense. Each of them, like a planet, has an orbit of its own; and as long as they move at medium distances from each other, they might pass and repass by myriads unnoticed. But when, like two planets, any of them come for a moment into conjunction, we are filled with astonishment; and yet, could we only keep an account of the myriads that never coincide, we should find probably that those which do, were only just the fair proportion, and not one more.

It has become almost proverbial that the romance of real life exceeds the romance of the imagination. The reason is plain. Events are

of two kinds—those of an *average*, and those of an *extreme* character. But as average events form the great bulk, they become a standard by which the mind measures whatever comes and claims its belief. The writer of fiction, therefore, if he wishes to be read, must not depart very far from that standard of probability formed out of the average struck from the general current of events. But this very average implies that there are extremes; and when Reality takes such extremes, we *must* believe them; the only liberty then left us, is to wonder as much and as long as ever we please. For example, were a person in London unexpectedly to encounter an old friend in the street, whom he had not seen for ten or twenty years, it would be simply remarkable: were a writer of fiction to say that the encounter occurred twice—on the same day—and in different and distant parts of the city, he would be making a sufficient demand on our credulity; to exceed this would be outraging probability. And yet reality has exceeded it. A person—himself a stranger in town—accidentally met an old friend who was also a mere visitor in town; and, after parting, with the idea that they should never shake hands again, they met on the same day at the distance of some miles from the spot of their first interview, in the suburbs; and after again parting full of wonder at this singular coincidence, one of them entered the room of an inn at night just at the moment the other was astonishing two or three friends with an account of the strange occurrence.

THE PORTRAIT.

A SKETCH.

This picture must surely raise my reputation as a painter beyond the region of doubt, thought the youthful and aspiring artist, as he zealously plied his pencil, and had nearly completed the "last sitting."

Bright visions of public applause, distinguished success, and high patronage, crowded into his head, which was nearly as scantily supplied as his purse, except with what had reference to painters, paintings, &c.; till at length the work was finished; and, oh! the trying moment, when it was submitted to the inspection of the family, the father of which the portrait in question was intended to represent.

"Oh! isn't it exactly like Pa!"—"oh! oh! isn't it like him?" was the cry which was raised and reiterated by the younger branches of the family.

The artist, who was in the back-ground of the group, with his palette on his arm, breathed, and wiped his brow, while these amiable young persons rung the changes of their approbation, which to his ear was most delicious music. "Yes," said

mamma, "it certainly does the artist great credit; but he has not flattered you, my dear," turning to her husband; "there's a fierceness of expression which is not natural to you: I think, Sir," added she, addressing the painter, "if you could give a smile to the countenance, it would be more striking, as it would then convey an idea of Mr. H——'s benevolent look." "Yes," he replied, scarcely knowing how to meet the suggestion; for in truth Mr. H——'s head, although by no means intellectual in appearance, was far from expressing the milder emotions to which she alluded, "it is natural that you should wish to see in the picture the look which is habitually directed to yourself, and if you could be present in the room as a mark for Mr. H——'s attention while I retouch the portrait, perhaps the alteration you wish might be effected."

Before the lady could reply, her eldest son entered the room. "Well Charles, what do you think of it?" said his father, observing that he stood mute. "Why," said Charles, with a few

doubtful glances, alternately from his father to the portrait, I think it will be like, but—it's difficult to say—indeed it would be unfair to pass an opinion before it is finished." "Yes, yes," echoed old Dr. — the family physician, who happened to be present, "it is only children and fools that wish to see these things before they are completed." Here the painter exchanged looks with Mrs. H—, (who had manifested the most trying impatience to see it from its commencement,) not without observing that she had a little more than her usual colour. The son, meanwhile, took up a book, which seemed to be the object that occasioned his visit to the apartment, and walked indifferently away, saying, "of course it will be very different when it is done." And as the door closed behind him, the blank look of the artist betrayed the emotions of disappointment and vexation which had put to flight the gay fancies he had been indulging.

Mr. H—, who till now had suspended his remarks upon the work, asked, "Is the hair to remain thus?" adding that he ought to have run a comb through it while it was in progress, and was proceeding to elicit from the painter his ultimate intentions respecting the cravat, &c., when he was interrupted by the servant, who announced a visitor, Mr. C—. This gentleman was scarcely half through the ceremony of salutation, and was remarking "what delightful weather we have," when his attention was arrested by the portrait.

"Bless me! why that's yourself, sir," he exclaimed, looking Mr. H— hard in the face, "I declare you and it are as like as two brickbats, except that it's rather too red for you. It's an astonishing likeness—but don't think there's quite enough slate in the hair."

"One would think, C—, that you were a bricklayer: can't you command more poetical similitudes than bricks roofed with slate?" observed Mr. H—.

"Well then, twilight," rejoined Mr. C—, "or grey, if you will; you know I don't flatter you, old boy; we are going down the hill now, eh?" said he, familiarly inserting his elbow into his friend's ribs. "But upon my word," he proceeded, again inspecting the portrait, "it is as like as any thing I ever saw in my life, with one exception, and that was a portrait of my father, that was done some years before he died, by a self-taught artist, I forget his name, a most astonishing likeness it was. Yes, that's decidedly good, but I must say, I think it flatters you a little."—"Yes, I'm inclined to think the painter has done me justice," answered Mr. H—, looking towards the latter as he spoke, just as this victim of opinion and caprice was silently thinking that hope was like "a reed shaken with the wind," one moment prostrate, and the next erect.

The look, however, which Mr. H— directed towards him, served as an introduction to Mr.

C—, who, with an air of familiar condescension, proceeded to say to him, "Well, sir, I'm sure this picture does you infinite credit, but there's just one thing that struck me as soon as I looked at it, if I may be allowed to make a remark—I don't profess to be a judge, therefore won't pretend to pass an opinion; though I used to be very partial to the art at one time, but don't be guided by what I say, but still—you'll excuse me, don't you think that shade over the eye is just a thought too strong?"

"Do you mean *this* eye?" answered the painter, pointing with his pencil: "Aye," replied the visitor, "just the least in the world."—"Oh," exclaimed Mrs. H—, "pray do not touch that eye, if any thing it is the most like of the two."—"No, my dear madam," rejoined Mr. C—, with a slight appearance of confusion, and turning to the artist again, he added, "you didn't understand me to mean *that* eye?" "Then you mean *this*," obsequiously answered the latter, and touched gently (to all appearance) for some minutes about the eye in question.

"That's a wonderful improvement," vociferated the critic exultingly, as the painter withdrew from the picture; "that touch has altered the character of the whole face,—that's an amazing improvement,—I could not have supposed it would have made such a difference—positively, ladies and gentlemen, I couldn't desire to see any thing more perfect. By the way, have you seen Mr. Owen's portrait? it's the most surprising thing I ever saw in my life, with one exception, and that is, the likeness of my poor old father I mentioned to you—Oh! it's prodigious!" here the door opened again and Mrs. L— was ushered into the room.

A few minutes, of course elapsed, while the family satisfied themselves as to the state of Mrs. L.'s health, &c., but as soon as they could decently glide from this important point, they directed her attention to the portrait, while she took her seat upon the sofa.

She then looked at it for a few moments, as if doubtful what to say, casting an inquiring glance round the circle, in an evident endeavour to come at the sense of the company on the subject, from which to take her cue. At length, turning to the former visitor, she ejaculated, "It is not meant for you, sir, is it?"

This observation produced a laugh from some, surprise in others, and mortification in all, especially the artist, who was now heart-sick, and turned towards the window, like a leech from the salt.

"My dear madam, just look again," said Mr. C—, "it's a most admirable likeness;" and then the lady, finding she was against the stream, began to edge round. "Why yes," she replied, "now I come to look at it again, I see who it is meant for; Oh! yes, to be sure," she continued, "There's the forehead exactly—and also the hair,"

and now, placing herself in a remote corner of the apartment, she exclaimed with great apparent delight, "Bless me, I declare, as I stand here, I see the likeness is very strong."

"To be sure, ma'am, that's just what I said," shouted Mr. C——, "it's strong and striking;" at the same time addressing the original, and bending his body into a graceful curve, to take a telescopic view of the picture through his hand, he said, "just look at it this way, my dear sir, it really looks like reality."

"I should be afraid of a crick in my neck, sir," answered his friend, drily.

Not exactly relishing the quiz, the self-complacent critic again addressed the tortured painter, who was preparing to leave the scene.

"I dare say," he observed, "you find a great difference in point of facility in drawing various faces?" "Nearly as much as in the opinions passed

upon them when drawn," was the laconic and somewhat sulky reply.

"Ah!" retorted the former, "no doubt you are often greatly annoyed by the remarks which you are obliged to hear; that's one reason why I should never be able to endure your profession." "Truly, sir," returned the painter, with an air of quiet indifference, "there are few pleasures without some alloy; but those of painting are far more than a balance for its pains; and as to the grievance you allude to, one becomes accustomed to it; and besides, patience, like most other virtues, acquires strength by exercise."

By this time he had reached the door of the room, and having taken his leave, walked abstractedly down stairs. Emerging from the hall, he took precisely the direction which did *not* lead to his home, and had proceeded nearly a mile before he discovered his mistake.

A SCOTTISH SACRAMENT.

CHAPTER II.

PRAYER being ended, and the congregation seated, Dr. S. opened the Bible, and read as the text of a sermon appropriate for the morning of a communion Sabbath, the ninth verse of the thirteenth chapter of Hosea;—"O Israel, thou hast destroyed thyself; but in me is thine help."

This text enabled Dr. S. to expand and illustrate the same doctrines which he had touched upon in his prayer. The fallen condition of man was clearly proved both by reason and by revelation: and it was shown with equal force and conviction, that if man could not, of his own strength, continue in purity of obedience to the Divine law whilst he himself was in a state of innocence, much less can he of his own strength return to such obedience after he has once departed from the law. That, in consequence of this, the sentence of condemnation is naturally upon the whole human race, and that though in the sight of men there are distinctions of good conduct and of evil conduct, yet in the sight of God all mankind are sinners, and to him even the purity of the natural man is iniquity.

I must confess that I was never before so forcibly struck with the consciousness of the universality of sin in the sight of God, and the utter impossibility of salvation, and the delivery from the bondage and the punishment of this sin, except through the mediation of one capable of suffering as man, and at the same time saving as God; Jesus Christ, the atonement, the Lamb slain from the foundation of the world to take away the sins of the people; "O Israel, *thou* hast destroyed *thyself*; but in *me* is thy help." These are words of the most important instruction and of the most delightful consolation; for he who convinces us of sin, at the same time makes known to us the way of salvation.

The day had become so oppressively hot that, though the windows were thrown open, the crowd in the low-roofed church was so close, that Dr. S. felt a little pause necessary in the middle of his sermon, the more especially as that sermon was only the beginning of his professional labours for the day. It was therefore necessary that he should husband his strength in order to preserve equal energy throughout. Accordingly, when he had established in the clearest manner man's degeneracy, and utter inability to help himself, he proposed a short pause, during which the assembled people should again sing to the praise of their God.

The hymn which he selected for this purpose was Dr. Logan's beautiful paraphrase on the first twelve verses of the forty-second chapter of the evangelical prophet Isaiah, in which there is a very sublime delineation of the coming, the power, and the goodness of the Messiah, and the final blessing of the whole earth by the establishment of his kingdom, even to the remotest isles of the ocean. Dr. S. read the whole hymn; and there was one stanza which produced a most heart-thrilling effect. It was that which describes the deliverance of mankind from sin through the atoning blood of the Redeemer:—

"Asunder burst the gates of brass,
The iron fetters fall;
And glorious light and liberty
Are straight restored to all."

Almost immediately follows the portion which was sung by the congregation:—

"Sing to the Lord, in cheerful strains,
Let earth his praise resound,
Ye who upon the ocean dwell,
And fill the isles around."

O city of the Lord, begin
The universal song,
And let the scattered villages
The cheerful notes prolong.

Let Kedar's wilderness afar
Lift up her lonely voice,
And let the tenants of the rock
In accents rude rejoice ;

Till, 'mid the streams of distant lands,
The islands sound his praise ;
And all combined, with one accord,
Jehovah's glories raise."

My companion sung those spirit-stirring stanzas with tenfold more emotion than he did the former ones ; and in this he only agreed with the far greater part of the congregation, for all had now begun to feel the spirit of the solemn service in which they were engaged.

Nor was this spirit less conspicuously displayed in the preacher himself. To bring "glad tidings of great joy," is the most delightful part of the public duty of a Christian minister ; and when Dr. S. endeavoured to bring home to his congregation the proper feeling of the words, "In me is thine help," that heart must have been hard indeed which would not have answered to his appeal. He set forth in the most lively manner the great goodness and unspeakable condescension of the Son of the most high God, co-equal and co-eternal with the Father and the Holy Spirit, in consenting to dwell upon earth, and take upon him the frailty of human nature, in order that he might make, for fallen man, the only atonement which the broken law of God admitted. He established, in the clearest manner, the truth of this delightful portion of the revealed will of God ; he pointed out that this is a matter of the heart, a matter of faith and not of speculation, and that faith in Jesus Christ, communicated by free grace, is the only ground of salvation, the only plea which any one of the human race can have for acceptance in the sight of God. But while he showed, in a most convincing manner, that this salvation by grace through faith, is the only salvation in the sight of God, he also showed that other evidence is necessary in the sight of men ; and that they who claim to be the children of the Most High by regeneration, must walk as becomes his children, and let the power of religion be made manifest through the whole tenour of their lives. Thus clearly establishing, that though good conduct is not in itself religion, or in anywise meritorious in the sight of God, as saving men from sin ; yet that the holy commandment is so binding upon the conduct, that a man whose life is not pure, can have no part or lot in that pardon and atonement which were purchased by the blood of the Saviour. This close connexion between sound doctrine and purity of life was pointed out in a manner exceedingly clear and highly impressive ; and the effect which it produced upon

the congregation was as delightful as it was striking.

My companion, to whom such a display was nearly new, was, so to express it, ears all over ; and though he of course received the information only by the natural inlets of spoken language, yet it seemed to tell upon every feature and every limb. He remained silent and motionless, and only appeared to feel a transient touch of regret, when the imploring of God's blessing upon the instruction intended to be communicated by this part of the service, showed that it was at an end. Hitherto it had been only preparation ; but now Dr. S. descended from the pulpit, in order to declare the sacred authority for the solemn rites of the Supper, and the encouragement of the worthy to the Lord's table, and the warning of the unworthy of their danger in approaching the same. The words of the institution are in St. Paul's first epistle to the Corinthians, the eleventh chapter, from the twenty-third verse :—"For I have received of the Lord that which also I delivered unto you, That the Lord Jesus the same night in which he was betrayed took bread ; and when he had given thanks he brake it, and said, Take, eat, this is my body, which is broken for you : this do in remembrance of me. After the same manner also he took the cup, when he had supped, saying, This cup is the new testament in my blood ; this do ye, as oft as ye drink it, in remembrance of me. For as often as ye eat this bread, and drink this cup, ye do show forth the Lord's death till he come. Wherefore whosoever shall eat this bread, and drink this cup of the Lord, unworthily, shall be guilty of the body and blood of the Lord. But let a man examine himself, and so let him eat of that bread, and drink of that cup. For he that eateth and drinketh unworthily, eateth and drinketh damnation to himself, not discerning the Lord's body."

This portion of sacred Scripture contains in itself the whole institution of the Sacrament of the Last Supper, and the invitation to the worthy to partake, and the warning to the unworthy from partaking of the same. But though the words are clear and expressive, the application of them to individuals is not for mortal man to decide upon, how wise and how good soever he may be. Real religion is between God and the conscience ; and it remains alone with Him who is the searcher of hearts to say who is truly worthy and who is unworthy of partaking in the solemn rite of the Christian religion.

Dr. S. evidently felt that he stood before the assembled multitude only as a counsellor in these matters and not as a judge ; and therefore, though with great earnestness and ability he set light and darkness before them, and delineated all the acts of external conduct by which worthiness or unworthiness may be known, he made no personal allusion, but left the conscience to bear

witness in the sight of God to the effect and truth of God's own word, as declared by the inspired apostle.

The invitation to the worthy to sit down at the holy table, and commemorate the great sacrifice made for sin by the Redeemer, was most encouraging; and it was addressed to all ages, ranks, and conditions, without distinction, upon the well-grounded principle that, if equally blessed with the faith delivered to the saints, all mankind are equal in the sight of God. The young, who were then to communicate for the first time, the aged, whose last sacrament, and probably whose last Sabbath it might be, together with those in the prime and vigour of life, were all equally remembered, and equally encouraged by the devoted and discriminating minister.

The discourse was in fact a paraphrase or commentary on that part of the sacred volume which had been read; and when Dr. S. came to that portion of it which throws the burden and the responsibility off the minister and upon the people themselves, he was peculiarly impressive. "Let a man examine himself, and so let him eat of that bread and drink of that cup." This examination, without which no man can in a profitable manner take into his hands the symbols of the broken body and shed blood of the Son of God, is an individual matter, and must and can be performed only by each for himself. But in this, as in all other matters, instruction may be given, and the counsel of the wise and the experienced may lead the young and the ignorant to the knowledge of the truth. This was the view of the matter taken up by Dr. S. He examined no one; he passed sentence upon no one individually; but he set forth in the plainest language and the most forcible manner, how the grand business of self-examination should be performed, in order that every one may know, and assure himself, how he stands in the sight of that All-seeing and All-searching Being, "to whom the secrets of all hearts be open."

At this part of the doctor's address, I observed that my companion was deeply affected; for his moistened eyes were riveted on the speaker, and there was upon his countenance a far more intense glow than I ever had observed when we were studying the beauties of nature together. Then came the warning, "He that eateth and drinketh unworthily, eateth and drinketh condemnation, or severe reproof (for so the original may be rendered,) to himself, not discerning the Lord's body." Unexplained, the denunciation contained in this passage is terrible; for, as we use the word "damnation" only in reference to the final retribution of the wicked in the abodes of never-ending woe, the word taken in this meaning would deter the feeble-minded and the faltering from the holy table, and from those blessings of the heart and ameliorations of the life which

spring from communion there. But Dr. S. showed clearly that though unworthy communicating is a grievous sin, as contemning the free grace of the Redeemer, and coming to his holy table with lying lips and a heart of guile, it is still not unpardonable; but that the power and the goodness of the Divine Author of our holy religion, can save and deliver at the last hour, and pluck "as brands out of the burning," those who stand upon the very verge of destruction. This is one of the peculiar excellences of the Christian religion: it is sin, and it is suffering—more than they who are without God in the world can tell, to delay the covenant of the Redeemer, for one day or even for one hour; but still, his loving-kindness is to the latest moment of the human span; and he can give salvation even when the grave is yawning for the sincere penitent. Who is a God like unto our God, long-suffering in kindness, whose mercy is for thousands, and endureth for ever!

Dr. S. was peculiarly earnest in impressing upon his numerous and attentive congregation the necessity of "discerning the Lord's body," in order to a worthy participation in the holy sacrament of the Supper; and on this part of the subject he took occasion to set before them the crucified Redeemer in the most lively manner, but in strict accordance with what is declared in the sacred Scriptures. In the delivery, this part of his address seemed exceedingly short; but it was too long for my transcription, and too fine for my memory. Suffice it to say, that it was a faithful and forcible delineation of God the Saviour in all that he did and suffered to deliver mankind from the torment of never-ending misery; and none could hear such a delineation without the most fervent prayer that God would make them his "in the day when he maketh up his jewels."

The warning to the unworthy was more brief than the encouragement to those of an opposite character; for there seemed a hearty, though sustained and sober feeling, on the part of the doctor, that the many years of his zealous ministry in the parish of B— had not been spent in vain. Still, however, the chief points of disqualification for a place at the holy table were touched upon; and among the rest the sin of families who know not the Lord, and do not bend the knee to him in family devotion, was especially insisted upon. I saw Tom Allan's lip quivering, and tears rolling in fast succession down his cheeks, for he was the son of a prayerless father, though a father of orderly conduct in the world's estimation; but I said nothing; I felt that Tom's eternal interests were in better hands than mine.

The address was at last concluded; and while Dr. S. slowly and solemnly descended to the tables, for the sake of putting into the hands of the people seated there the symbols of the

broken body and shed blood of the Redeemer, the congregation filled up the pause by singing a hymn; and in so far as my young judgment went it was most appropriate. It ran thus:—

"'Twas on that night, when doomed to know
The eager rage of every foe,
That night in which he was betrayed,
The Saviour of the world took bread,

And, after thanks and glory given
To him that rules in earth and heaven,
The symbols of his flesh he broke,
And thus to all his followers spoke:—

My broken body thus I give,
For you, for all; take, eat, and live;
And oft the sacred rite renew,
That brings my wondrous love to view.

Then in his hand the cup he raised,
And God anew he thanked and praised;
While kindness in his bosom glowed,
And from his lips salvation flowed.

My blood I thus pour forth, he cries,
To cleanse the soul in sin that lies;
In this the covenant is seal'd,
And heaven's eternal grace reveal'd.

With love to man this cup is fraught,
Let all partake the sacred draught;
Through latest ages let it pour
In memory of my dying hour."

Before the singing of this hymn was concluded, Dr. S. had broken the bread, and tasted the wine, after having, in appropriate terms, implored the blessing of Almighty God upon the ordinance; and he handed to the elders of the congregation, and they to the people seated at the table. The silence during this part of the service of the day was so deep, that had a grain of sand fallen it would have sounded on the floor, and all present were held as by enchantment. Though it was not new to me, I felt it strongly; but upon my companion it had a more powerful influence, and seemed to engross his whole soul. Indeed, I never saw one so young enter so deeply into the spirit of religious rites, of which, like myself, he was only a spectator; and that day, as well as other days, have very strongly impressed me with the great importance of social worship, wherein "every man helpeth his neighbour, and saith to his brother, be of good cheer;" and I have often been forcibly struck with the value of the Divine command, "forget not the assembling of yourselves together."

While the symbols of the body and blood of the Redeemer were slowly handed round the communion tables, the minister devoutly, and at pauses, repeated such texts of Scripture, and other short sentences of a religious character, as might tend to direct the meditations of the people to holy things. "Speak ye comfortably to Jerusalem, and cry unto her, that her warfare is accomplished, that her iniquity is pardoned." "I will go into thy house with offerings, I will pay thee my vows." "As by one man's dis-

obedience many were made sinners, so by the obedience of one shall many be made righteous." "Where sin abounded, grace did much more abound; that as sin reigned unto death, even so might grace reign through righteousness unto eternal life, through Jesus Christ." "Let not sin therefore reign in your mortal body." "Neither yield you your members as instruments of unrighteousness and sin." "Sin shall not have dominion over you; for ye are not under law, but under grace." "By grace are ye saved, through faith, and that not of yourselves, it is the gift of God." With these, or similar quotations of sacred Scripture, interspersed with short sentences of his own did Dr. S. occupy the minds of those people who were seated at the communion table, and also rivet the attention of all those who were within the church, until the singing of another hymn gave signal for the first communicants to retire, in order that their places might be occupied by others.

The hymn which was sung on this occasion was not less impressive than the former, and it bore expressly on the same solemn occasion, embodying, in fact, an epitome of the Christian religion:

"Behold the Saviour on the cross
A spectacle of woe!
See from his agonizing wounds
The blood incessant flow;

Till death's pale ensigns o'er his cheek
And trembling lips were spread;
Till light forsook his closing eyes,
And life his drooping head!

'Tis finish'd—was his latest voice;
These sacred accents o'er,
He bowed his head, gave up the ghost,
And suffer'd pain no more.

'Tis finish'd—the Messiah dies
For sin, but not his own:
The great redemption is complete,
And Satan's power o'erthrown.

'Tis finish'd—all his groans are past;
His blood, his pains, and toils,
Have fully vanquished our foes,
And crowned him with their spoils.

'Tis finish'd—legal worship ends,
And gospel ages run;
All old things now are passed away,
And a new world begun."

This form of service, consisting of psalms, addresses by the different ministers, and verses suited to the condition of the communicants, was continued till after four o'clock, so varied in the expression, according to the power and ability of the different preachers who assisted on the occasion, but yet so uniform in its general scope and tendency, as that the prolonged description of it would have the appearance of repetition. The interest, however, did not abate; and when the morning service came to a conclusion, that conclusion appeared to be a subject of regret to the whole

assembled multitude ; but it was regret tempered with gratitude for the sacred instruction which had been given, and the lively and impressive manner in which the death of the Saviour, and salvation through him had been set forth.

While the more solemn and appropriate service of the day was carrying on within the church, the remainder of the multitude, who could not find sitting or even standing room within the walls, listened to a succession of sermons delivered from the tent. There was an interchange of situation, by which those in the church, and those hearing the word under the

canopy of heaven, exchanged places with each other ; so that the whole had the appearance of being one congregation ; and these changes were made with so much quietude and decorum, that they could hardly be noticed, except by the appearance of new parties within the church, as those who rose from the tables retired to hear the word in the open air. In fact, there was no voice audible during the long service of that solemn day, except the voices of the ministers of religion communicating sacred instruction, or the voices of the people when drawing near to their God in songs of praise.

THE ENGLISH PARLIAMENT.

(From the "Rev. Dr. Humphrey's Tour," published in the *New York Observer*.)

LORDS AND COMMONS.

It is known to every one, who feels the slightest interest in foreign politics, that a struggle pregnant with momentous issues, has long been pending between the British government and the British people. The arena of this contest has been the House of Commons. The majority there, has been regarded on both sides as holding the key of the country. Hence those mighty efforts which have been made by the Tories to retain it, and by the Whigs to wrest it out of their hands. It was in the Commons, only, that the people could cause their voice to be heard ; it was at this point alone, that they could make their power felt. Though the dominant aristocracy had greatly the advantage at first, chiefly growing out of the unequal system of the representation in the popular branch of the government, and though the final issue of the struggle has at times been doubtful, it is manifest that free principles have been steadily gaining ground—that "the house of David has been waxing stronger and stronger, and the house of Saul weaker and weaker."

A mere glance at the history of this great contest, is all that my design requires, or that my limits will permit. Despairing of ever being able to get near the throne, while the elective franchise was virtually nullified, to so great an extent, in the manner of returning members to the House of Commons, the people made their first great assault upon "rotten boroughs." These, the Lords were determined never to surrender ; for full well they knew, that the putting of so many representatives into the hands of the democracy of the country, would render it impossible for them any longer to resist the popular will. They fought as long as any hope remained of beating back their assailants ; but they were obliged to yield. "Old Sarum" and a host of other "rotten boroughs" were disfranchised, and the representation was transferred to Manchester, Birmingham, and other populous towns and dis-

tricts. This was a great victory. It was felt to be so, on both sides. The Tories, as we all remember, cried out, that the constitution was violated, was changed, was prostrated. They called it "a revolution ;" and multitudes of them still look back upon it as the most disastrous innovation which has befallen the constitution within the last two hundred and fifty years. But for that change, the power would still have been in their hands. It was a popular triumph over the Lords, and I had almost said over the throne itself, of which the victors have made so good a use, that there is every prospect of their maintaining and increasing their ascendancy. The Municipal Reform Bill of the last session will add to their strength, whenever a new election takes place. The bill which is now before Parliament, for the correction of similar abuses in Ireland, is opening a new parallel, and, at the same time, O'Connell comes out boldly, with a proposition radically to change the British Constitution, by disfranchising the Peers, and making the House elective. There is no probability, that even the Commons will respond to this revolutionary movement, at present. But their march is certainly onward. The people have got the power, and they will not rest where they are. Other important concessions they will undoubtedly extort from the hereditary branches of the government, and where they will stop it is impossible to say. The Commons House of Parliament, is now virtually the "Upper House." The Lords most certainly will not yield to its dictation, till the last extremity. But what can they do? If things should come to a crisis, and there should be no material change in popular sentiment, the physical power of the nation would, by "fearful odds," be against them ; and that, as every body knows, is a power which the high estates cannot resist. That there are other things nearly as rotten as the old boroughs, in the political fabric of Great Britain, and which ought to be removed, I have no doubt ; but the

work requires a great deal of skill and caution, much more than can be expected in times of high popular excitement. Decided as my own republican principles are, I am no radical; I hope I never shall be; and I freely confess, that if God had cast my lot in England, instead of America, with just the views I now have, I should feel some solicitude, lest the measures now in progress, to correct old abuses, and bring down the government to a more popular standard, should be carried so far and so fast in the march of reform, as to put the paramount interests of the country in jeopardy.

LIBERTY OF SPEECH AND OF THE PRESS.

What the law of libel in Great Britain is, or how it compares with that of the United States, I do not know; but I am quite sure, there is no place in the world, where the measures of government are more freely and fearlessly canvassed than they are there. The supreme executive is not often directly assailed—but the reason is, the king is scarcely regarded as a free and accountable agent. When spoken of at all, in connexion with any obnoxious measure, he is represented as acting under “tutors and governors.” It is his cabinet—it is the ministers that have wickedly misadvised and controlled the royal automaton;—and there are no epithets in the English language, too criminatory—too grossly abusive, to be heaped upon them. Whoever may be at the head of affairs, in times of high political excitement, they are sure to be assailed and denounced by the opposite party, as stupidly and wickedly incompetent—as in league, either with the enemies of the crown or the enemies of the people. “They have sold themselves to a faction—they have betrayed their sovereign—they ought to be impeached for high crimes and misdemeanors in the administration of the government.” These, and such like, are the charges which are gravely reiterated, in the opposition journals, whether Lord Lyndhurst, or Lord Brougham is on the woolsack.

As for the people, they assemble just when and where they please—from one hundred, to twenty or fifty thousand; to discuss their grievances—to demand reform—to remonstrate against the passing of an obnoxious Bill, to denounce the ministers, or in whatever other way they may choose to give utterance to their political opinions. At these meetings, whether in the provincial towns or the metropolis itself, they speak with a boldness and vehemence which cannot be surpassed, both against men and measures; and they embody their sentiments, often, in the most inflammatory resolutions. All this they do, with entire impunity; which shows, that the freedom, and even the licentiousness of speech, is as great in England, as it ever was in this or any other country. The common people are not so universally politicians there as here. They are not so well educated; and intelligence of this sort is not so freely and cheaply

circulated, as it is in the United States. But wherever you meet the English, at the dinner party, or in hotels, or in stage coaches, no matter where, and no matter who happens to be present, they speak of men and measures, with the high and familiar tone of freemen, who have always been accustomed to express their opinions, without fear or molestation. One of the last rights, it appeared to me, which the great body of our English kindred would think of surrendering, was that of discussing their *beer* and their *politics*. The former, I hope, they will ere long be persuaded to relinquish; but to the latter, let them cling for ever.

PETITIONS TO PARLIAMENT.

No people, I believe, avail themselves so freely or so effectually of the right of petitioning the national legislature, as the people of Great Britain. Some of the most important acts of the government, such as the abolition of the slave-trade, the opening of the great empire of Hindostan to the free introduction of Christianity, and the abolition of colonial bondage, have been hastened, if not extorted, by this method of embodying and presenting public sentiment. Why it is that we are so much less successful than our brethren of the British Isles, in the exercise of this right;—whether it is because we are not so well united, or so persevering, or what may be the reason, I will not undertake to say. Our constitution, in this particular, is certainly as free as theirs; but, from some cause, the right of petitioning has thus far been with us little better than a nullity. I do not recollect that, in a single important case, the prayers of the people have been answered by the American Congress. It seems to be the policy of our rulers to discourage them. What bearing this may imperceptibly have upon the liberties of the country, I leave for wiser heads to determine.

POPULAR ELECTIONS.

THERE is a wide difference, as every one knows, between the elective franchise in Great Britain, and the principle of universal suffrage, which is now virtually established in this country. That the right of voting is too much restricted there, notwithstanding all that the reform bills have done to extend it, almost every American will be apt to say; but whether the evil is greater, whether it more endangers the existence of free institutions than throwing the door wide open to all—foreigners from every country under heaven, as well as native born citizens—time must determine. There is no more beautiful theory in political science than the purity of elections; but where did it ever exist to any extent, or for any considerable length of time? What patriot does not tremble when he thinks of the bribery and corruption which, young as we are, have already crept into our own repub-

ican system? Some foreign tourists have noticed and made the most of this, in disparaging our institutions. They are greatly annoyed by the mote in our eye, while they take little notice of the beam in their own. There is no country where popular elections cost so much as in Great Britain. From fifteen to twenty thousand pounds, and I believe more, are sometimes expended on each side, to return a single member to parliament. What purity can there be in such elections? How dreadful must be the moral effects of one or two hundred thousand dollars spent in this manner? Where the candidates have vast estates of their own, which is sometimes the case, they bear the whole expense of the canvass; but in other instances, their friends make up large purses to aid them. The new parliament was elected a few months before my arrival in England; but when Sir Robert Peel and his

colleagues resigned, their successors in office were obliged to appeal once more to their constituents, and be re-elected, before they could be sworn into the cabinet. This, in some of the counties, brought on a new contest. In Devonshire, particularly, the struggle was very great between the political friends and opponents of Lord John Russell, and large sums of money were expended on both sides. Two or three days previous to this election, you might see men carrying subscriptions for him through the principal streets of London, upon the top of long rods, with the name of his lordship printed in broad capitals on the pasteboard. But all would not do: the conservatives of Devonshire were too strong for him: he lost his election, and was compelled to get himself returned as a member from Stroud, which he was much less ambitious to represent.

JAMES THE FIRST OF SCOTLAND AND THE LADY JOANNA BEAUFORT.

THE following poem is founded on some of the incidents in the life of the above-mentioned prince, who was one of the most remarkable men of the age in which he lived. Flying, in early youth, from the snares which had been laid for him by his uncle, who governed his dominions, and who was suspected of designs against his life, he, with his attendant, was captured by an English vessel off Flamborough Head, in the year 1405. After suffering imprisonment in various castles for nine years, he was finally consigned to that of Windsor, where he endured a farther incarceration. Being kept a close prisoner, his leisure hours were devoted to study. Grammar, rhetoric, natural philosophy, law, divinity, poetry, and music, engaged his attention. It is said, that in the latter he made remarkable proficiency, and was not only a skilful performer, but also an excellent composer. His compositions appear to have been of a plaintive and melancholy character, originated by the peculiarly sad and affecting circumstances in which he was placed. Some of his poetical productions are now extant: the "King's Quhair;" "Christ's Kirk on the Green;" and "Peebles at the Play;" which, though evidently but a very small portion of his writings, evince that the genius of the royal prince was by no means inferior to that of any of his contemporaries.

It was during his detention at Windsor that he became deeply enamoured of the lady Joanna Beaufort, a maiden of royal blood. His manner of introduction to her was as is detailed in the poem; and she is thought to be the lady alluded to in the "King's Quhair."

Upon his deliverance from his captivity, which extended to a duration of nearly twenty years, he married the object of his fond and romantic attachment; and presented her to his people as Scotland's queen. His melancholy end is known to every reader of history.

The sun shines bright o'er keep and tower
O'er perfumed grove and shady bower;
And gaily leaps the exulting stream,
Sparkling in beauty 'neath the gleam
Of sunlight, while his soothing song
Is heard the daisied banks along:
And o'er the deep blue summer sky
The light-winged fairy cloudlets fly;
The crested fountains gently play,
Cooling the sultry air,
And flowers, that shun the garish day,
Fling richest fragrance there.
And all around is fair and bright
As the glittering scenes that rise
To the raptured soul in the isles of light,
In the far off golden skies.

But Scotland's king within that tower
Has counted many a weary hour;
And gazed with sad and languid eye
On that deep blue o'er-arching sky;
And thro' that vale, from day to day,
Has seen the waters wind their way;
Has gazed on wood, and knoll, and dell,
And learned to know each object well.
The captive monarch's footsteps fall,
Within that living tomb,
In lonely echoes on the walls,
As the dreams of memory come.
And he sighs for another distant land,
Where his boyhood loved to stray,
Where the cloud-wreathed mountains proudly stand,
And the tempests wing their way.

* * * * *

A maid came forth as evening's sigh
Shook the light leaves. Her sparkling eye,
Bright as the fount that near her played,
The secrets of her soul betrayed;
Her brow with marble might compare,
With raven's plumes her glossy hair;
And sweetly shone the sunny smile
That clothed her beauteous features, while
The young winds from the violets flew
On viewless wings of air,
To drink from lips of rosy hue
The sweets that lingered there.

With sylph-like form she moved along,
And, where a willow flung
Its saddened shade, this mournful song
That gentle maiden sung.

"There's a calm when the ocean's fury 's past,
And the young waves hush their voice;
When the song is still of the roaring blast,
And the flowers again rejoice.
The infant's wail in its sleep is hushed,
And joys its bosom fill,
But the lonely heart, with its bright hopes crushed,
Is never, never still.
The winds are mute when the tempests sleep
On the hoary mountain's brow,
But the saddened heart, with its passions deep,
No holy calm may know.
When the wild flowers bend round the lonely tomb,
And the winds are cold and chill,
In the darkened depths of that silent home
The heart will then be still."

The monarch heard that mournful strain,
And wished the song might rise again;
For sadness o'er him shook her wing,
While busy thought each cherish'd thing
Called to remembrance in that hour,
When, yielding to sweet music's power,
His heart was softened, and the lay
Died in its melting notes away.
He took his lute, whose magic tone
Had oft his soul beguiled,
When, in that guarded chamber, lone,
He heard its breathings wild.
He touched it, and the trembling chords
With silver music rung,
Then to the minstrel maid, in words
Of answering sadness, sung.

"The soldier from the battle plain
Returned, with glory crown'd,
His peaceful cottage-home again,
And kindred hearts, has found.
But the lonely captive's footstep falls
Where the loved ones may not come;
A stranger sad, from his father's halls,
And an exile from his home.
Brightly the summer gilds the earth
That smiles 'neath the sunny sky,
Where flowers wake up in their morning birth,
And the vales in beauty lie;
But the captive's heart is ever sad,
And his spirit finds no rest,
When the heavens are bright and the earth is glad,
In the hues of sunshine drest."

He ceased, and as the floating tide
Of music pass'd, the maiden sigh'd
For the captive king, whose plaint of woe
She had heard in mournful numbers flow.
She linger'd till the hours of day
Had melted into twilight grey,
Till the glittering stars of silent night
Shed down their pure and holy light;

And the evening winds had softly sigh'd
Their song to the sleeping flowers,
Ere that maid to her lonely chamber hied,
To the dreams of happier hours.
And the monarch oft, as o'er the plain
Came the breeze's saddened song,
Seemed still to hear the melting strain
Floating the air along.

Often that beauteous vision stole
O'er James's sad and mournful soul;
That form, that voice, were both divine;
And pilgrim at a sacred shrine
Ne'er gazed with holier awe, when low
He murmur'd forth his solemn vow,
Or at the altar, meekly kneeling,
Breathed forth his deep, impassioned feeling,
Than James looked on that lady fair,
When to her pleasant bower
She came, and waked her music there
At evening's peaceful hour.
Both sang of love, and the melting strain
The winds would oft prolong;
And their hearts were bound with its golden chain
As they nightly woke their song.

* * * * *

The nobles met in the castle hall,
At Henry's joyous festival;
And Scotland's king, in proud array,
Walk'd mid the throng that festal day;
And England's courtly beauties shone
That time before the royal throne.
They met—the prince and minstrel maid—
And mutual looks their thoughts betray'd.
The lute went round, and the jest ran high,
And the wine cups passed along;
But the monarch only heard the sigh
She breathed as he raised the song.
And his spirit drank from the fount of love,
As he gazed on that maiden's eyes—
Bright as the stars that in beauty above
Shine in the nightly skies.

* * * * *

In Stirling's courts is heard the strain
Of rapturous joy, as once again
Her monarch treads the halls of state,
Where crowds of noble warriors wait.
And who is she with downcast eye,
That blushes as she passes by?
'Tis Beaufort's daughter, Scotland's queen,
The mistress of that brilliant scene.
The king to his own loved highland home,
To his ancient father-land,
From the Southron's royal court has come,
With a proud and gallant band;
And has placed the crown on the fair white brow
Of the lovely minstrel-maid,
Who oft, 'neath evening's purple glow,
To the captive king had play'd. T. A.

TURKISH TROPHIES OF WAR.

(From *Walsk's "Constantinople."*)

But the circumstance which rendered the event of interest to me was, that the news of the victory was accompanied by certain sacks filled with two thousand five hundred pair of ears, cut off from the slain, and sent as a present to the

sultan by the pasha, as vouchers for his victory. It was further stated, that these trophies were then exhibited in piles before the gate of the seraglio. I had ever considered such a display as one of those tales which rather embellish

works of oriental fiction, than exist in reality; and whatever foundation there might have been for such a practice in earlier and ruder ages, that it was quite impossible a European nation of the present day, however barbarous, would continue it. I was determined not to rely on reports, but to judge for myself: so I took a janissary, and notwithstanding the remonstrance of the capigee, or porter at the gate, not to venture into Constantinople in the present state of excitement, we passed over.

The streets exhibited a dismal picture. The Greeks and Armenians, whose busy habits had given animation to the places which they frequented, had all disappeared, and their shops in general were closed up. The Turks alone, and few in number, were walking about; the imperturbable gravity that distinguished them when I was here before, darkened into a gloom and solemnity of aspect that was awful. We passed the body of a man not long decapitated. It was lying, as usual, across the street; a handful of saw-dust had been scattered, as if to absorb the blood, but a copious stream from the arteries was still flowing over it. Around it was crouched a number of dogs, at a little distance, some of them already lapping the blood, and all waiting till night to lacerate the body. To add to the revolting and horrid effect of the scene, the place was a market, and so narrow, that meat and other eatables lay just over the body, looking like its dismembered parts, and strongly reminding me of some accounts of African shambles, where human flesh is exposed for sale. The Turks trampled on the body as they passed, without seeming to notice that such a thing was there. We had to step over it; and hastened on. I requested the janissary not to lead me by another such expo-

sure; so he brought me through byways, till we ascended to the gate of the seraglio.

And here I found, indeed, that the Turks did actually take human features as Indians take scalps; and the trophies of ears, lips, and noses, were no fiction. At each side of the gate were two piles, like small haycocks, formed of every portion of the countenance. The ears were generally perforated, and hanging on strings. The noses had one lip and a part of the forehead attached to them; the chins had the other, with generally a long beard; sometimes the face was cut off whole, and all the features remained together; sometimes it was divided into scraps, in all forms of mutilation. It was through these goodly monuments of human glory the sultan and all his train passed every day, and no doubt were highly gratified by the ghastly aspects they presented; for here they were to remain till they were trampled into the mire of the street. Wherever the heaps were partly trodden down, the Turks passed over with perfect indifference. The features, growing soft by putridity, continually attached themselves to their feet, and frequently a man went off with a lip or a chin sticking to his slippers, which were fringed with human beard, as if they were lined with fur. This display I again saw by accident on another occasion. And when you read of sacks of ears sent to Constantinople, you may be assured it is a reality, and not a figure of speech. But you are not to suppose they are always cut from the heads of enemies, and on the particular occasion which they are sent to commemorate. The number of Greeks killed at Patras did not exceed perhaps one hundred, but noses, ears, and lips were cut indiscriminately from every skull they could find, to swell the amount.

MEN AND THINGS.

BUTTON-HOLDERS.—At this season of the year, a button-holder, (or man who holds his acquaintances by their buttons,) who knows his own powers, is justly formidable to his friend. Old Izaak Walton, in directing his young fisherman how to impale a frog, says, "use him as though you loved him;" and I would desire the button-holder, who wishes to assassinate any one, to "use him as though he loved him." The best time for catching your man is in the winter, or the early spring, when a keen easterly wind is blowing sore throats, coughs, and catarrhs; then hook him by the button, just at the corner of the street, opening with a good sweep to the east; any sort of gateway or tunnel is, however, still preferable, provided there be a good blast; there hold him, and ask him how all his family, his friends, and relations do, till the teeth chatter in his head, and his nose turns blue. He will struggle with you, perhaps, and making a desperate effort for life, endeavour to break away; but stop him with "one word more," and "I will not keep you another moment," and so forth, as you will know how to do, till you perceive the usual symptoms of ague, then let him go, for he will only go to his bed and send for the apothecary, and when he dies, in due

course, you will tell all his friends how singular it was, that you had such a pleasant chat with poor —, in the street, on the very day that he fell ill.

A MISER.—The Cincinnati Chronicle gives the following sketch of a miser who resided at Medford:—

He was a man of fine talents, and of uprightness; with nothing faulty but his love of money. This passion had run into insanity, and in respect to wealth, I respect him as a monomaniac. During the latter years of his life he had a yearly income of something like 30,000 dollars. His property was invested in bank and insurance stocks in Boston, the interest of which he collected in person upon the dividend day, for to lose a day's interest was what he would never do. He resided in Medford, to avoid Boston taxes, and made his bargain at so much a week, to go without supper, and candles, and fire in the evening.

From Medford he used to walk into Boston, generally getting into some cart, if possible, before coming to the bridge, so as to avoid the cent toll. Many anecdotes are current respecting him, but I give only one. He had walked in from Medford one spring morning, and had spent the forenoon in business at State-street. Toward noon, it being warm, he became

hungry and faint, for he was near sixty years old, I believe. Unwilling to encounter the expense of a dinner in town, the old man about two o'clock set out for the country. As he came near the bridge, he was tempted, being very faint, by some oysters upon the board by, and stopped to inquire the price. "How do you sell your oysters?" said he to the man at the board:—"Six cents a dozen for the small, and twelve for the large," answered the man. The poor hungry wretch looked at the oysters, and thought, and looked at the oysters, and thought, and looked again and thought again. "Won't you let me have a dozen of the large for ten cents?" said he. "No, I won't;" replied the oyster-man, crossly. Again the miser thought—he could not save *two* cents, that was clear; but perhaps he might *one*, and that would pay his toll; so said he, "Suppose I have half a dozen of each, will you let me have them for eight cents?" The man answered, "I've told you the price, if you won't pay that, you shan't have any." While he was thus speaking, a drayman stopped as he passed to have a dozen oysters, and seeing the old man, and how hungry and wretched he looked (he had the St. Vitus' dance) and thinking him too poor to buy the oysters, he pulled out some money, and throwing it down, bid the man give the old fellow a dozen, jumped upon his dray and was off. The poor miser reached his trembling hand and took up the money; "Shall I have the half dozen of each for eight cents?" "No, you Jew!" cried the other. "Then I'll keep the money," said he, dropping it into his pocket, and proceeding on his way an hungred. He crossed the bridge rejoicing, but so weak was he before he reached home that he fainted on the road, and was found there and carried home by a milkman.

SCHWARTZ.—Of Schwartz and of his fifty years' labour among the heathen, the extraordinary influence and popularity which he acquired, both with Mussulmans, Hindoos, and contending European governments, I need give you no account, except that my idea of him has been raised since I came into the south of India. I used to suspect, that, with many admirable qualities, there was too great a mixture of intrigue in his character; that he was too much of a political prophet; and that the veneration which the people paid, and still pay him, (and which indeed almost regards him as a superior being, putting crowns and burning lights before his statue,) was purchased by some unwarrantable compromise with their prejudices. I find I was quite mistaken. He was really one of the most active and fearless (as he was one of the most successful) missionaries who have appeared since the apostles. To say that he was disinterested in regard to money, is nothing; he was perfectly careless of power; and renown never seemed to affect him, even so far as to induce an outward show of humility. His temper was perfectly simple, open, and cheerful. *Bishop Heber.*

WAR.—John Wickliffe, the great reformer, was particularly disgusted with the ambition which induced rival popes to assert their claims to St. Peter's chair, at the expense of torrents of human blood; for he not only considered the whole trade of war to be utterly unlawful for Christians, but thought it wrong, on the principle of the gospel, to take away the life of man upon any occasion. Respecting conquest, he saith, "the title of conquest is utterly worthless and untenable, unless the conquest itself be expressly commanded by the Almighty."

JEWISH CUSTOM AT TABARIA.—While the rabbin recites the Psalms of David, or the prayers extracted from them, the congregation frequently imitate, by their voice or gestures, the meaning of some remarkable passages. For example, when the rabbin pronounces the words, "Praise the Lord with the sound of the trumpet," they imitate the sound of the trumpet

through their clenched fists: when a horrible tempest occurs, they puff and blow to represent a storm; or should he mention the cries of the righteous in distress, they all set up a loud screaming; and it not unfrequently happens, that while some are still blowing the storm, others have already begun the cries of the righteous; thus forming a concert, which it is difficult for any but a zealous Hebrew to hear with gravity.

TRUE COURAGE.—A certain Scotsman, being solicited to enter the army and fight for his country, said to the officer who was desirous to enlist him, "I would ask you, sir, two questions; which, if you answer to my satisfaction, I shall have no hesitation to take up arms. The first is, can you tell me if I kill a man that he will go to heaven? or can you say whether, if I am killed myself, I shall likewise go there?" To these two questions, so very important and solemn, the officer could not reply. "Well, then," said this brave Scotsman, "I dare not send a fellow-creature unprepared into eternity, neither dare I rush thither myself unbidden." Noble resolution! He certainly is the greatest hero who bravely encounters the dangers of life and the contumely of the world, rather than offend his Divine Master. He is the mightiest conqueror, who obtains the victory over his own passions.

MUSIC.—There are periods of exhaustion, and there must be hours of relaxation and repose in the life of all, from the prince to the peasant, when we need some innocent amusement to employ and interest without wearying, and to exclude improper occupations; and this necessity is greater in proportion as the intellect is less cultivated. There are moments of physical debility or moral discouragement, when the mind is almost incapable of operating upon itself. At such seasons music is of great utility.

The popular vocal music introduced of late years into Germany and Switzerland, is peculiarly adapted to these objects. Without being trifling, it is cheering and animated. Without being directly religious, or even didactic, it presents ordinary subjects under an aspect fitted to excite the nobler feelings, to elevate the thoughts above the world, and kindle the feelings of devotion. It comprises songs on the various objects and phenomena of nature, the rising sun, the rolling thunder, the still evening, the rich harvest, and presents something applicable to every circumstance of life. It thus associates common occurrences and objects with the most elevated feelings, and every view of nature calls forth the notes of pleasure, and the song of praise to its Author.

In furnishing an amusement of this kind we shall divert from others of a doubtful or injurious character. In giving young men such a means of innocent excitement by music, appropriate to their age and feelings, we diminish the temptation of resorting to stimulating liquors, and other questionable modes of producing cheerfulness. In a village in Switzerland, a set of drunken, disorderly young men, were led, by the cultivation of vocal music among them, to an entire exterior reformation, which was regarded with as much surprise as the change in regard to temperance in some parts of our own country. When they met at a public-house, they resorted to this method of raising their spirits, instead of drinking, and amused themselves with singing songs and hymns adapted to improve the mind, and elevate the heart, instead of the profane or indecent conversation of noisy clamour which is generally heard on such occasions.

But, aside from this benefit, music, of itself, has an effect which cannot be doubted, in softening and elevating the character. It diminishes the strength of the passions, by keeping them, for a time at least, in a state of inaction. It counteracts them by producing the opposite and softer feelings.

EXTREMES MEET; OR, TOPS AND BOTTOMS.

"Give me," says some wise one, no matter who, "the making of a nation's proverbs! and I care not a straw who has the making of its pills." He is right: proverbs are the very picklocks of knowledge, which clear all her wards, undo all her bolts, and enable us to peep into all her pigeon-holes, even though the good old lady should lock up with all the closeness of a college founded and fashioned in monastic times.

"Extremes meet." Yes, they do meet, in all matters of theory and practice, of thinking, of saying, and of doing. They cannot do otherwise; for it is the way of the world, demonstrated, and demonstrated upon "this great globe itself." The east and the west, the north and south, or any two points whatever that lie at the opposite extremities of a diameter on the card of the compass, are extremes in respect of direction. But let any two of you take, the one the one of these extremes, and the other the other, keep course without deviation, and push on, striding and sailing, far enough, and you shall meet face to face. It is true that you shall have changed places by the journey; that Mr. East shall have become Mr. West, or Mr. North shall have become Mr. South, and *vice versa*. This instance, however, instead of disproving the proverb, carries the truth of it much farther; by proving that extremes not only meet, but that when they do meet, each may, and probably must, cease to be itself, and pass into and become the other.

The proofs lie every where, so that we may take them at random. For instance, a public speaker, in the senate, the pulpit, or any other place of oration, shall muster, "as prave 'ords as you shall see on a summer's day," and he shall build them up, epithet upon epithet, as a child builds a castle of cards, exulting in the beauty and loftiness of the structure, and beaming with fond hopes of its elevation. But, alas! a single epithet—a single card more than enough—down it tumbles in shapeless ruin; and the hapless builder of words, or of waste paper, is left in utter astonishment, the butt of grinning waggery to those who would have lauded him "to the very echo," had he stopped in time. There is a pretty little practical lesson in this; but we shall leave the reader to find it out—as that will make it his own, and he will think the more of it.

In the above instance, we have had allusion chiefly to that "arrowy fire" of eloquence, or "iron sleet" of sarcasm, which is intended to mow down the understandings of men as Samson mowed down the Philistines, and carry their feelings and hearts whithersoever it lists. But it holds in *bathos* as well as in *pathos*, in sinking as well as in soaring. In many companies and assemblages, where all have the freedom of

speech—indeed we may say in any such company or assemblage—if some overshadowing or overawing cause is not present—there is always what may be called "a man of mouth," a man with "a jaw in gimbles," which will not rest upon any one subject; but which, making sound upon all, makes sense upon none; and not only this, but completely obliterates all that has been said upon it by others.

It may be that the noise of an instrument of this kind is useful, inasmuch as it clears the mind for the reception of new ideas, just as a sponge clears a slate for new sums, or a demonstration table for new diagrams; or as the eating of one dinner clears the dishes and plates for another. The investigation of this is somewhat foreign to our present subject; but still it is well worthy of the reader's cogitation; and we are anxious to give him every opportunity of being his own philosopher, in order that he may take the burden off our shoulders.

Well, one of these "men of mouth," may be running on and on, *in omne volubilis ævum*; and the king's English may be cracking under him, like the timbers of a bark in a hard gale; and the company may be casting their understandings overboard, in order to lighten the bark, and wishing they could so cast their ears too; and the stays may be parting, and the mast sprung, and the waves ready to engulf the whole in one common oblivion. Somewhere in the company there sits a man upon whose countenance the wind of words has had no effect; but who takes all calmly, like some veteran Palinurus, whom no winds can shake and no waves alarm. The moment of extreme peril comes. Another squall, another surge, and the waters of dull oblivion would close over them for ever. "Stand clear a-lee there, ahoy!" shouts he of the immovable countenance: the sound of the hatchet is heard amid the storm; the mast is overboard; the bark rights, and the danger is over. To drop the simile, which like most similes is not very apposite, "the man of mouth" goes on, from absurdity to absurdity, and from inanity to inanity, till some one, panting for relief, treads on his corns, quite accidentally of course, but not on that account the less heavily. The man of mouth breaks into "another strain," more true to nature than the finest passage in the finest book that ever was written by mortal man of his own thoughts, and remains dumb for the rest of the evening.

Profound thinking furnishes another illustration confirmatory of the truth of the proverb. The region above all thought, down to the surface of contact, where wisdom begins to dig her mine, is of course one of sheer vacuity; and though, in some fond cases, every one believes thought to be very deep, yet the thoughts of a finite being must have a limit. Well, your phi-

losopher, resolute in speculation, goes with mattock and shovel to work this same mine of wisdom. He picks and delves away, soon getting rid of the flowery sward which "creams" over the place, to begin with. Then he casts up mud, next gravel, after that miry clay; and not unfrequently, as he is beginning to delve the last of that, in bursts the green sand with its ocean of water, just as a haggis does at the knife of a hungry Scotsman! and the miner, borne up on and by the spouting mixture, is projected from the pit of his labour as from the mouth of a cannon. He lies for a time, begrimed and panting, upon the bank, and ever after wanders on the mountains of vanity, boasting of the wonders that were revealed to him in the philosophic mine.

If the absence of the "soaked" sand-bed should prevent this catastrophe, the next stroke of his mattock may be on the rock, so unexpectedly and so sharp, as to make every nerve of his arms jar up to the shoulders.

By the way, this word "jar" by no means reaches the idea. The Scotch *dirl* does it perfectly; but the force of it cannot be rendered in English. "Jar" is a word of many uses, and, as such, precise in none of them; "thrill" has quite another meaning; and there is no possibility of drawing a short word like "dirl" to the length of a phrase, without making it as weak as a cobweb. Here, by the bye, is an interpolated proof of the truth of the proverb, which we certainly did not intend to adduce; though, as we are convinced, we may as well confess, lest the sharp-witted reader should triumph. We meant to be very profound in our philology; and, lo and behold, we are close on the confines of nonsense.

To resume: the philosophic miner recovers his tone, and sinks away, now casting up a lump of oolite, full of ammonites, nummulites, and other tenants of a former era; then an antediluvian fish, with scales like crown pieces; and yet, again, the impress of some antediluvian creature, with jaws a fathom long, teeth like the heaviest harrow, and worthy of a name which would have broken their jaws and loosened their teeth, in the very heyday of their vigour. New wonders occur as he works, increasing in number at every step. But as the pit deepens, so does the darkness, till all becomes pitchy night. The miner is resolute however: he drives at it with the mattock, as if he himself were a giant before the flood; out goes the bottom of the mine, and the miner is in the same "sheer vacuity" as he was ere he began.

We trust we have now proved sufficiently the truth of the meeting of extremes, as a proposition applicable to every case that can be imagined; but if the reader is not satisfied, he may add our own case in the writing of this paper. We meant to be very witty and very wise; and

he is at perfect liberty to take us as in the opposite extremes, while we proceed to draw the inference and make the application.

One inference must suffice: If extremes meet, then—the farther asunder the extremes are, the nearer to meeting. Sophistry itself cannot bar that conclusion; and so we shall work it no deeper from fear of the darkness. A question rises upon it: By what means are the extremes to be separated so as to approximate their meeting? The answer lies in a nutshell;—By lengthening the middle part. Take a bit of copper bar, half an inch long, and the same in diameter, and all your art shall not make the extremes, the extremities, the ends of it meet. Pull it *seriatim* through a sufficient number of wire-drawing bores, decreasing in diameter; take hold of it by the middle, and keep it suspended; and the ends shall meet by the impulse of their own gravitation. So much for the inference.

Now for the application: The extremes of society are those portions of it which may, aptly enough, be styled "tors and sorrows,"—those who can rise no higher, and those who can sink no lower. That these meet in one not unimportant respect, is evident without any illustration. They are both destitute of the desire of rising in the world; for the desire is quenched by gratification in the one, and it either never existed, or is quenched by reckless despair, in the other. This is incidental; but it deserves to be taken along, as it makes strongly for the general argument.

In the feudal times, when lord and serf comprised nearly the whole lay population, and there was no middle class worth mentioning as affecting the general character of society, the tops and bottoms were near each other, and consequently far from meeting. In these times, society was nearly stationary, or if there were fluctuations in it, it flowed and ebbed like the sea, but like that always preserved nearly the same average level. These flows and ebbs were not of the people themselves: they arose from external causes, the character of the monarch, or the ruling nobles, the general course of events, the seasons, or something else external of the people. Nor could it be otherwise; for the people was made up of tops and bottoms; and, according to the incidental truth, both of these are necessarily destitute of the very first germ and impulse of all improvement—the desire of bettering one's condition.

The reader must be careful not to narrow his understanding of this desire. It does not mean increase of wealth, or elevation of rank, for these may either be part of it or in opposition to it. More intellectual, more capable of usefulness in the world, and more acceptable in the sight of God, are the three essential parts of a better condition. This is the truth absolute, as the schoolmen used to say; whether it is to be attained by

coming down from the tops, or up from the bottoms, is *secundum quid*, upon the general question, and *equaliter* in those cases where the extremes of top and bottom meet.

How came that increase of distance between the tops and bottoms of British society, which has made them meet so very nearly as they do at the present time? A middle part has been introduced between them; and it has increased and increased, not by wire-drawing, like the bit of copper, but by actual accumulation of substance, till it has become the overwhelming majority of the nation, and pushed the extremes so far the one way, that they have come into contact in the other.

To what this middle class owes its origin, and what circumstances have tended to foster the principle of growth which is always inherent and vital in such a class, we shall not inquire. The elements of the inquiry are on the record of history, however; and "The origin and progress of a middle class in society," would be a beautiful subject for an ethico-political philosopher of the first class; but it would require one of the very highest order in that class, and quite free from bias.

We have room to mention only a very few of the points in which the extremes of tops and bottoms in society have met. In the first place, neither of them conduces in the slightest degree to the advancement of society. This follows as matter of course from the historical fact, that,

while they constituted the whole of society, it made no advance at all. The inference is so evident that any one may draw it. Secondly; both these classes of society are thrown upon the gratification of their animal passions, as the grand, indeed the sole, business of their lives. This follows from the desire of improvement being extinct in both; and the proof is in the same historical fact as the former.

These two points have a historical basis and need no argument; but a third point, and the only other one to which we shall advert, is of a more mixed nature:—The means by which the tops and bottoms of society seek the gratification of their animal appetites, if not exactly the same, are wonderfully similar. The proof of this, if we had space to go fully into it, would consist of a psychological argument, and an enumeration of facts. The argument is a short one. Man is the same animal, in whatever part of society he is placed: and if he seeks only the gratification of animal appetites, his gratifications must be the same in substance though they may differ in mode. A few of the facts:—The tops read *rifucciamentos* of fashionable intrigue. the bottoms read police reports, and trials at the criminal courts. The tops play at *rouge et noir* and *roulette*: the bottoms at E O and chuck-farthing. The tops dance at Almacks: the bottoms at ale-houses. The tops—but truce—enough at one time.

THE COSMOGONY OF MOSES.

ARTICLE I.

THE first sentence of the Bible contains, in point of information, more than all the volumes that have been written since the creation of the world. He who reads it for the first time must be struck with its sublimity, and it will induce a train of thought and reflection at once pleasing and painful, satisfactory and perplexing. It carries us back to the origin of things, and tells us of what we cannot imagine, much less understand. "In the beginning:"—this announces, without explaining, a great and inscrutable mystery—the birth of time. It began, as far as it relates to us, with the creation of the earth which we inhabit. But what is creation? how did it commence? and when? If creation and time are coeval, is a period somewhat less than six thousand years the age of both? Here we are lost in conjecture. In stretching beyond this epoch, we are obscured in the darkness of nonentity. The appalling ideas of eternity and infinity obtrude themselves upon us; we apply the one to duration, and the other to space. But what is duration? what is space? Eternal duration! Infinite space! Duration without periods, uncheered by conscious intelligence; space un-

limited, yet void and without inhabitants; they are both pure abstractions, too subtle for our comprehension. The mind, having reached thus far, is thrown back upon itself; it looks on "the palpable obscure, the solid temperament of darkness," and seems to be identified with its horrid elements. Eternity and space are nothing, and can do nothing; yet there is a bright line of existence stretching along the one, and a universe of glorious worlds inhabiting the other: whence have they originated? This question was never answered till Moses solved it by revealing the wondrous fact, "God created the heavens and the earth." Philosophers, unable to discover an assignable cause for their own being and that of the universe, resolved the whole into self-existence, and made it eternal. They founded their position on their ignorance; the world could not be an effect, because they could not trace its formation to an adequate agent. How much more philosophical to have suspended their judgment, and to have affirmed nothing certainly where they had no light to guide them; or to have reasoned themselves into the opposite persuasion from the analogies around them, and

from what they could ascertain from nature of the doctrine of causation! It is not more difficult to assume the eternal existence of one supreme Intelligence, the Creator of the universe, than the eternal existence of matter, and all its modified forms of being. But the truth seems to be, that man is, of himself, utterly incapable of forming a just and rational conclusion on this great subject. It is by faith—that is, by divine revelation—we understand that “the worlds were framed by the word;” that is, by the power of God.*

Before we enter on the Mosaic account of the Creation, it will be proper to premise, that two objects are continually kept in view throughout the volume of the Old Testament: one is, to turn men from idolatry, in all its forms of vice and error; the other, to direct their attention, by the gradual development of the scheme of prophecy, to the future Messiah.

In order, therefore, more clearly to understand the design of the author of the Pentateuch, we ought to take into our consideration the state of the world at the period when it was written. Mankind were sunk in the grossest idolatry; and that idolatry, for the most part, originated in the neglect, the perversion, or the misapprehension of certain truths which had once been universally known. Moses, therefore, commences his narrative by relating, in simple language, the truths thus disguised or perverted; and he alludes, in many of his expressions, to the surrounding superstitions.

In this narrative it is likewise important to remark, that the Mosaic account relates chiefly to mankind, and to that portion of universal being with which we are more immediately connected. We are not to conclude that because it is said “In the beginning God created the heavens and the earth,” that the supreme and ever blessed

* “God.” Many attempts have been made to define the term “God;” as to the word itself, it is pure Anglo-Saxon, and among our ancestors signified not only the Divine Being now commonly designated by the word, but also “good;” as, in their apprehension, it appears that “God” and “good” were correlative terms; and when they thought or spoke of Him, they were doubtless led, from the word itself, to consider him as the Good Being—a Fountain of infinite benevolence and beneficence towards his creatures. “A general designation of this great First Cause, as far as human words dare attempt one, may be thus given: The eternal, independent, and self-existent Being; the Being whose purposes and actions spring from himself, without foreign motive or influence; he who is absolute in dominion, the most pure, most simple, and most spiritual of all essences; infinitely benevolent, beneficent, true, and holy; the cause of all being, the upholder of all things; infinitely happy, because infinitely perfect; and eternally self-sufficient, needing nothing that he has made. Illimitable in his immensity, inconceivable in his mode of existence, and indescribable in his essence, known fully only to himself, because an infinite mind can be fully apprehended only by itself. In a word, a Being who, from his infinite wisdom, cannot err or be deceived; and who, from his infinite goodness, can do nothing but what is eternally just, right, and wise.”—*Dr. A. Clarke.*

God had dwelt alone in his own eternity, without giving existence and happiness to any creature prior to his formation of the solar system. We have no grounds to conclude that at one and the same time God created every thing that is contained in the vast unfathomable spaces of the universe. On the contrary, when we find him recounting to Job that, at the period “when he laid the foundation of the earth, the morning stars sang together, and all the sons of God shouted for joy,” we cannot but infer that these stars and these sons of God were pre-existent, and consequently no part of the Mosaic creation. It may be presumed, indeed, that the Almighty fiat gave existence to all the matter in the universe at once, calling it out of nothing in a moment. But we are not hence to infer that it was forthwith moulded into its various forms as so many worlds and systems of worlds in boundless space. It is certain that “the earth was without form, and void;” and this, probably, was the original state of the substances out of which the luminaries of heaven were created. How long the earth remained a chaos, we are not informed. The discoveries of geological science lead to the conclusion, that many centuries must have passed away before this globe was fitted and prepared for the habitation of man and the other animals and vegetable productions which are now found upon its surface; and that, during these long periods, great changes took place in its constituent elements. This notion does not affect the statement of Moses. If it were clearly demonstrated, the era of creation fixed by the inspired historian would not be contradicted, or its accuracy impugned. Why the Divine Being suffered the earth to continue a wild mass of confusion and disorder, before he transformed it into a habitable world, is a question we must resolve into his sovereign pleasure alone, since, according to the ideas we entertain of his moral perfections, there is nothing to fix the creation of any thing sooner or later than his own arbitrary will. Yet if conjecture be allowable, may we not imagine the creation of mankind as immediately subsequent to the revolt of those angels who left their first estate;—and as intended by infinite Goodness to fill the thrones they had vacated by a race of creatures who should, prior to their exaltation to his beatific presence, pass through, in some distant world, a trial of their obedience;—and that the world designed for their reception lay in chaos till the period approached when he had determined to call them into existence?

One other preliminary remark will conduct us at once to the inspired narrative; it is this, that Moses describes the work of creation through its several stages, as the phenomena would have successively presented themselves to a spectator, had a spectator been in existence; and that, as an inhabitant of the earth, he has given this

comparatively little planet a pre-eminence above every other, only so far describing the heavens as they bear a visible relation to it.

When the six days' work of creation began, there existed what the inspired penman has called "heaven;" the earth was likewise in being,—a mass of unformed matter, a desolate waste, its atmosphere totally immersed in water, and surrounded with a dense, impenetrable darkness. The historian tells us, that "darkness was upon the face of the deep;" and the first indication of the change about to be effected is given in these remarkable words: "And the spirit of God moved* upon the face of the waters." Whether it was to still the wild uproar of chaos, or to agitate the stagnant deep, or to awaken latent energies that had long slept in this formless mass of waters and earth, confusedly mingled, is not revealed to us. Whatever was the design of this preliminary act, the agent was unquestionably divine; for by "the Spirit of God," we are to understand God himself; probably the third subsistence in the eternal essence, to whom the perfecting acts of creation are assigned in the sacred volume. The Spirit that garnished the heavens, now began the wondrous work of transforming the earth, from a desolate waste, into a fit habitation of a creature, bearing the intellectual and moral image of God. He moved upon the surface of the waters: by what instrumentality no further appears than we are permitted to gather from the term employed, namely, "Spirit," which literally signifies "wind." If, therefore, a material agent were used on this occasion, it was a wind of God; an active energy, like the conflict of the heavens, called into exercise by Almighty Power. After moving on the waters, the Creator proceeds to utter his fiat,—*"God said."* Certain divines, ancient and modern, profess to discover a great mystery in this expression; they think that Moses understood by it the co-operation of the Son of God in the work of creation. From the writings of the New Testament, they derive their comments upon this part of the Old; and quote these words of St. John's Gospel, that, "In the beginning was the Word;" that that Word was God; "that all things were made by it." And that which St. Paul says, that, "By him were all things created, visible and invisible, those that are in heaven, and those that are in earth." The truth of this, as a general doctrine, we are not disposed to ques-

tion; but whether the phrase under consideration points it out, we scarcely dare venture to affirm. The comment of the Psalmist seems to give, at least to my mind, the precise idea: "He spake, and it was done; he commanded, and it stood fast." The creating word was an emanation of power, proceeding from Jehovah, the Father, the Son, and the Holy Spirit; and hence, under different aspects this great work may be ascribed to each subsistence, but not in such a sense as to separate one from the others. It was the "Elohim"† who said, &c.; and this word being plural, has long been supposed by the most eminently learned and pious men to imply a plurality of persons in the Divine Nature. According to this view of the subject, we are to regard the Godhead as the author of creation.

Six days were employed in this mighty undertaking. But why, it may be asked, was it not effected in a moment? Why did the Creator, to "whom a thousand years are as one day, and one day as a thousand years," occupy this lengthened period of time in accomplishing that, which only required the instantaneous volition of his mind? We are not to seek the reasons of this procedure in God, but in ourselves, and in the limited capacities of intelligent creatures. We, and all other intelligences, are formed for the contemplation of the works of the Almighty, that by our knowledge of him, through this medium, we may praise and glorify his adorable perfections. In condescension, therefore, to the comparatively weak faculties of his creatures, God was pleased to make use of six days in creating the world, that we might more easily discover the order, and follow the guidance of his wisdom, in the operations of his hands. As neither our senses nor imaginations are capable of applying themselves to the minutest parts of matter, so neither can the mind conceive the production of things, so many and various, in an indivisible moment. For this reason, God interposed a sensible space of time between the work which he might have formed all at once, and by one single act of his will.

With regard to the extent of creation which these six days embraced, we have already intimated our persuasion, that it did not comprehend the whole universe. And this we believe is now generally admitted by the most learned commentators. There are two hypotheses, however, which are supported by very able advocates,—and both are represented as equally agreeing with

* "Moved." This word in the Hebrew, according to the opinion of some, both ancient and modern interpreters, signifies literally a "brooding" upon the waters, as a hen does upon her eggs; but as there are only two places wherein the word occurs, (Deut. xxxii. 11; and Jer. xxxiii. 9.) Mr. Le Clerc contends, that in neither of these it will properly admit of this sense; and therefore he rather thinks it (as our Ainsworth seems to do) to be a metaphor taken from the hovering and fluttering of an eagle, or any other bird over its young, but not sitting over, or brooding upon them. A distinction of no great moment in my opinion.—*Stackhouse.*

† "Elohim." Let those who have any doubt whether Elohim, when meaning the true God, Jehovah, be plural or not, consult the following passages, where they will find it joined with adjectives, verbs, and pronouns plural. Gen. i. 26; iii. 22; xi. 7; xx. 13; xxxi. 7, 53; xxxv. 7; Deut. iv. 7; v. 23; Joshua xxiv. 19; 1 Samuel iv. 8; 2 Samuel vii. 23; Psalm lviii. 12; Isaiah vi. 8; Jer. x. 10; xxiii. 36; See also Prov. ix. 10; xxx. 3; Psalm cxlix. 2; Eccles. v. 7; xii. 1; Job x. 1; Isaiah vi. 3; liv. 5; lxii. 5; Hosea xi. 12; or xii. 1; Mal. i. 6; Dan. v. 18, 20; vii. 18, 22.—*Parkhurst.*

the inspired cosmogony. I will state them both, though the latter appears to me to be sustained by the greater weight of evidence and of probability.

It is strenuously maintained by some, that the Mosaic creation reached no farther than this sublunary world. They assure us, that the work assigned to the fourth day was not an actual creation;—that the lights of heaven were not then for the first time called into being; but simply rendered visible in the firmament, expanse, or atmosphere, which was at that period newly formed, and that they were appointed to rule over the day and over the night; to divide the light from the darkness, and to be for signs, and for seasons, and for days and years. It is contended that, according to the Hebrew idiom in the sixteenth verse, “to make,” is equivalent to appoint to a certain use; and that the discovery of these luminaries, by means of the atmosphere, is, in our regard, as real a creation as if they had never before existed. Having thus cleared the way for their system, these theological philosophers proceed to its development; assuming the cosmogony of Moses as the foundation of their superstructure. Thus, according to them, at the period when God said, “Let there be light,” our little planet, whether now first created or only restored, was a chaotic mass of earth, water, and dense tempestuous air. A flood or efflux of water from its own bowels covered its whole surface; and the atmosphere that surrounded this deep was yet too thick to admit the light. At this juncture the fiat was issued; the Eternal willed that light should be, “He commanded it,” says an apostle, “to shine out of darkness.” This was effected by a change in the density that surrounded the earth, and by its revolution round its own ideal axis in the space of the first twenty-four hours, which constituted a day to every part of it. It is not supposed that this first dawn of light was complete. It was enough that the dense air was sufficiently attenuated to render visible the surface of the terraqueous globe. Certain it is, that a considerable degree of light may exist without the bodily appearance of either sun, moon, or stars; and this light may be as truly distinguishable from darkness, and as properly called day, in opposition to night, as when it shines forth in its fullest splendour. Such days we have often seen, yet were never at a loss to distinguish them from the succeeding nights. If, then, the light mentioned by Moses was sufficient to create this distinction, it is more natural to ascribe it to the influence of the yet invisible sun on the attenuated air, than to the rotation of an elementary fluid of fire existing in the earth, and serving as an infant sun to the recent world, and out of which afterwards, according to modern commen-

tators, the sun and the whole starry hosts of the heavens were created.*

The most learned of the Jewish Rabbins, as well as some of the most distinguished of the Christian Fathers, in this respect differed *in toto* from the moderns. Origen roundly affirms that “No one of a sound mind can imagine that there were an evening and a morning during the first three days without a sun.” And St. Basil ascribes the darkness that covered the earth before the appearance of light, to the interposition of an opaque body between it and the heavens—a density of atmosphere too thick for the penetration of the sun’s rays. This he illustrates by an example that excludes all ambiguity. “Place around you,” says he, “at high mid-way, a tent, composed of dense and opaque materials: the temporary darkness which, by shutting yourself up in it, you will procure, may give you an idea of that darkness which covered the deep, and which did not antecedently subsist, but was the consequence of other things.” In this simple hypothesis every part of the Hebrew cosmogony is clear and consistent. It is plain that this light, if it emanated from the sun, or were excited by the sun, could not even imperfectly illuminate more than one half of the earth at once; and that while that half was illuminated, the other would remain in darkness, and this is fitly called “Separating the light from the darkness;” namely, by that ever-fitting boundary called by us the horizon. But in order to move this boundary, and to carry alternate light and darkness to every part of the globe, it was necessary either to make the sun circle gradually round the earth, or the earth to turn gradually on its own supposed axis towards the sun. The latter we at present know to be the case.

Light being thus separated from darkness by the foresaid ideal boundary, they would follow one another without interruption, and produce successively those vicissitudes which we call day and night; two other terms only for light and darkness; and the former being justly considered as the principal and most precious portion of time, an entire revolution of light and darkness was denominated one day; the evening being the term of light, and the morning the term of darkness.

* It is not a little surprising, that this unphilosophical notion should be maintained by a biblical critic, who, in his Commentary, introduces the discoveries of modern science with regard to the nature of the sun. It is now ascertained, that this luminary is not a vast ball of fire, and that he does not emit from his body innumerable millions of fiery particles, which constitute the light and heat of our system. The body of this immense globe is now discovered to be opaque, and the light which surrounds its atmosphere to consist of various elastic fluids, that are more or less lucid and transparent. It is likewise almost proved that the sun is a habitable world.

HEAT.

ARTICLE I.

WHEN we look abroad through external nature, and attentively consider the wonderful constitution of the universe around us, an opinion rather forces itself upon the mind, that, in the creation, the gracious Author of all being was pleased to institute a series of agents of a very peculiar character, and capable of very extensive operation, which should have the power of conferring on matter its various properties, of regulating its agencies, and of combining the whole into one beautiful and harmonious system. And these mysterious agents are known to us only by their effects. We are unable to attain them in an insulated state, so as to inquire into their qualities. So far they would appear to be immaterial; and yet their influences would rather indicate them as material; but if so, they are of so refined and subtle a nature as to be incapable of detection by our senses. It seems not, we think, an improbable opinion, that they may form the connecting links between the world of mind and the world of matter—that they constitute indeed the reins by which a spiritual Creator rules a material creation. They are usually known under the names of heat, light, and electricity.* It is of the former alone that we shall at present treat; but we can assure our readers that the study of them all is as interesting as their offices would appear important.

The term heat is usually employed under two different meanings; by the one, it is used to express the sensation that we experience when in the vicinity of a hot body; by the other, we imply the cause of that sensation. The word caloric has been proposed in the latter sense. The distinction however is scarcely necessary, but may at times be found convenient in avoiding a too frequent repetition of the same word.

The beauty and loveliness of the globe we inhabit is greatly to be attributed to the operation of this principle. Without it, we should no longer enjoy the sweet variations of climate and the bountiful succession of seasons. Every liquid, nay, even the very air we breathe, would become solid, plants would be unable to put forth their flowers, animals would die; in a word, earth would be a chaos. If then heat plays so important a part on the great stage of nature, as that its deprivation would lead to evils so great and so varied as those which we have imperfectly depicted, surely it is to the fullest extent worthy of our attentive consideration.

We deem it unnecessary to enter here into any account of the various hypotheses which have been from time to time advanced to explain the

nature of heat, as the inquiries themselves are so abstruse that we fear our readers would find in them but little to instruct, and certainly still less to amuse. We shall therefore proceed immediately with our subject, and shall treat, first, of the communication of heat from one body to another; and, secondly, of the effects of such communication; interspersing such practical illustrations as may suggest themselves as likely to prove useful or interesting.

All bodies on the surface of the earth have a constant tendency to attain an equality of temperature: thus, if a hot body be brought into the vicinity of a number of colder ones, the former will gradually part with a portion of its heat to the latter, until they are all equally warm. It is owing to this, that we experience the sensations of warmth and cold: for on placing our hand near a hot body, as a heated metal, caloric passes from the latter to the former, and thus gives us a sensation of heat; whereas, if we grasp a piece of ice, caloric is transferred from the hand to the ice, and so gives rise to the feeling of cold. Now this transference of heat takes place in different ways, according to the circumstances under which the bodies are placed: thus, if they are in contact with each other, the heat is said to pass from one to the other, and also from one part of the same body to a more distant part, by *conduction*; as when we immerse the bowl of a spoon in a cup of boiling water, the heat is conducted from the water to the lower end of the spoon, and also gradually along the particles of the spoon to the upper end; so that, although at first we could hold it without inconvenience, it will soon become so hot that we can no longer do so. Again, if the heated body is not in contact, but merely placed in the vicinity of a colder one, as when we put any thing before a fire, caloric is then said to be communicated by *radiation*. Of each of these we shall proceed to speak separately; and first,

Of conduction. All bodies have not the power of conducting heat with equal degrees of facility, for we find that it passes through some much more quickly than through others; hence bodies have been divided, with regard to the readiness with which they transmit heat, into conductors and non-conductors, the former including those through which it passes easily; the latter, those which conduct it very slowly. As instances of good conductors we may adduce metals; whilst wood, glass, and charcoal may be mentioned as bad ones. We see various practical illustrations of this fact in common life, but we shall only mention one. The handles of metal tea-pots are generally made of wood; because if they were made of metal, which, as we have just stated, is a good conductor, on pouring boiling water into

* Under the term electricity we include the galvanic and magnetic principles, as the identity of the former is established, and the latter may be regarded as a modification.

them we should not be able to hold them; whereas by interposing a bad conductor, such as wood, this inconvenience is avoided.

Various experiments have been performed with the view of determining the relative facility that different bodies possess of conducting heat, for which however we must refer our readers to works entering more deeply into the subject.* Liquids, in general, with the exception of mercury, are very bad conductors; so bad, indeed, that it has even been questioned whether they have any power of conducting heat: but although this is the case, when placed over a fire they nevertheless become heated with considerable rapidity. This however is to be attributed to a different cause. The particles of all fluids possess a considerable degree of mobility upon each other, and in addition to this they have the property of being expanded and becoming lighter by heat; so that when heat is applied to the bottom of a vessel containing a fluid, the lowest particles which first become heated expand and rise to the top; others that are colder and heavier immediately descend and take their place; these in their turn become heated, ascend, and give place to others, and this process continues until the whole mass of fluid is heated. Now, we see in this case that caloric is not conducted

gradually from one surface of the fluid to the other, but that it is in fact carried by currents of heated particles, ascending, whilst others are continually descending to supply their place. The same obtains not only in liquids but also in aeriform fluids. Dr. Prout has proposed to call this the *conduction* of heat, and although the term has not yet come into general use, it certainly is very expressive.

That liquids, however, do possess a certain degree of conducting power may be proved by applying the heat to the upper surface of the fluid instead of the lower. By this means the particles at the top are necessarily heated first, and as they become lighter they of course do not descend; hence none of the movements before described can occur: we find, however, that caloric is slowly conducted downwards, proving that liquids conduct in a very slight degree. This experiment is one of great delicacy, and requires considerable precaution, as the sides of the containing vessel are very likely to act as conductors, give rise to the process of convection, and thus obscure the effect.

Gaseous fluids are very imperfect conductors, but owing to the extreme mobility of their particles, it is difficult to estimate their great conducting powers.

THE OAK.

BEHOLD the forest, and th' expansive verdure
Of yonder level lawn, whose smooth shorn sod
No object interrupts, unless the oak
His lordly head uprears, and branching arms
Extends. Behold, in regal solitude
And pastoral magnificence he stands,
So simple! and so great! the underwoods,
Of meaner rank, an awful distance keep.

If any pleasure can be called bright, beautiful, and lasting, it surely is a love of nature, particularly of the green things that clothe the earth's surface: the contemplation of them gives a tone of health and freshness to the mind, and the cultivation of them vigour to the body. They afford occupation in our youth, and a delightful source of calm enjoyment in our after years. They serve as living and lasting memoranda of our pleasures and our sorrows; and, when the silent hand of time has "wede away" the companions of our youth and the friends of our manhood, the trees we have planted remain to us in all their increased and increasing loveliness and beauty. Of all our forest-trees, not one so much deserves the attention of the naturalist and planter as the oak. In every state, from the seedling plant to the last stage of decay, this beautiful and majestic tree solicits admiration from the eye of taste, as well as the less refined calculations of the speculator of profit.

* We cannot recommend a better than the excellent volume on Heat, published in Dr. Lardner's "Cabinet Cyclopaedia."

The beauty and utility of the oak appears to have been appreciated by the Druids, from which their appellation is taken: *derw*, "oak," Welsh; *darach*, Gaelic; and of which the *llan*, or sacred grove, was chiefly composed. On its branches grew the mystic mistletoe, used at their solemn rites; and, as now, no doubt the mistletoe was more abundant on the crab and hawthorn than on the oak, some peculiar virtue was attributed to the one rather than the other, from the beauty or utility of the tree upon which the parasite grew. This, probably, may be inferred, as, under the patched investiture of ancient mythological rites, a veneration may be easily traced for certain plants and animals that were of service to, or that held an influence over, the moral and physical condition of man. Its utility to our British ancestors must have been very great; for the fruit (however astringent and unpalatable it may be to a modern appetite) formed a portion of their food, and the rifted logs their chief article of firing: It seems to be lord of the soil, and more adapted to our clime than any other denizen of the forest. Unless in the neighbourhood of the sea, (a most unhappy situation for any tree,) it never shows a "weather-side to the storm."

About the middle of the merry month of May, generally, the gradual expanding of the crimp, yellowish foliage of the oak presents a most refreshing and beautiful feature in our landscape, and gives a richness and mellow relief to the

vivid and more dazzling green of the woods; while its extended and twisted arms, thickly curled and matted branchlets, form a dark and harmonious contrast beneath. It does not, as the sycamore and many other trees of rank and lush foliage, burst suddenly into leaf; but, as the season advances, expands to the blessed and balmy gales, deepened in its tint and more mature in its aspect. The wood formerly, when much more plentiful, was applied almost to all purposes where wood was wanting for durability and strength, particularly of household furniture and building. Few persons can look without feelings of admiration and pleasure on the now blackened but beautifully carved wainscoting in some of the ancient halls of our baronial ancestors; or see the heavy old oak table, with its massive carved legs and framework, without conjuring up in fancy the great wassail bowl circulating round it, amid the boisterous mirth and happy hearts of the rude and merry wassailers. In some of our old churches may be seen fine specimens of the durability of the oak in the great beams and rafters. They, untouched by the tooth of Time, or the burrowing of the worm, have stood for ages;

have seen creeds change and dynasties alter, and probably may see them again and again. But there is one purpose for which the British oak stands alone, unrivalled in the world—the purpose of ship-building. As adapted to this it has been the boast of our country, and the terror of our foes; lauded in lyric strains, from the ingle-side of the humble mud cabin to the princely halls of the noble; and well indeed is it merited.

“Britannia needs no bulwarks,
No castles on the steep;
Her march is o’er the mountain waves,
Her home is on the deep.”

The bark on the healthy growing oak, although rough, rugous, and seamed, is by no means unsightly to look upon, but has a fitness and adaptation, as the external covering of the majestic bulk which it envelopes. And, oh, what a grapple it affords for the ivy, with its smooth, bright, and glinting leaves, (for ever green,) to creep up the trunk, and enringing itself round the barked fingers, and, grateful for the protection it receives, deck it in garlands of beauty in the last stage of decay!—*Mag. Nat. Hist.*

SPECIMENS OF A NEW DICTIONARY.—No. III.

ANGER, without cause, the spontaneous combustion of the mind.

BARGAIN.—Your purchaser of bargains is, generally speaking, a connecting link between the two apparently irreconcilable characters—the prodigal and the parsimonious. Addison has told us, in a beautiful allegory, that Luxury and Avarice were formerly at war;—that, after various vicissitudes of fortune, they agreed at length to a permanent peace, on condition that Luxury should dismiss Plenty from his service, and Avarice Poverty, their respective ministers of state; and that Avarice should become the minister of Luxury, and Luxury of Avarice, by turns. Since that time, he declares, that Luxury ministers to Avarice, and Avarice to Luxury. Now, your buyer of bargains is an instance of a similar partnership. As a spendthrift, he purchases what he does not want; and as a miser, he purchases it because it is cheap. Rest assured, that though the family likeness may not be noticed by the superficial eye, he is a blood-relation of the Elwes and the Vandilles. The latter contracted a fever by pilfering some logs of a woodman; and, after refusing to be bled by a surgeon, and by an apothecary, because they demanded half a livre for the operation, he sent for a poor barber, who undertook to open a vein for three-pence a time; but, understanding that he should be bled three times, he asked what quantity was to be taken. “About eight ounces each time,” replied the operator. “That will be ninepence;—too much, too much,” said Vandille; take the

whole quantity at once, and that will save me sixpence.” Here was a *bargain*: he expired, in consequence, a few days afterwards, leaving immense wealth to the king.

CUSTOM.—The emperor of China, and “something more.”

DIFFICULTIES destroy small passions, but increase great ones; the wind extinguishes tapers, but kindles fires.

ERROR.—A serpent whose poison is deadly; though some persons seem to bring into the world with them, and others seem to acquire, an antidote, which enables them to take the reptile to their bosom, and remain unstung. Hence, some men are incomparably better than their principles; and some churches, whose creed overflowed with heterodoxy, have been able to boast a few members who number among the ornaments of mankind.

FREE INQUIRY.—Leave to be. When rightly conducted, it is leave to be happy; when wrongly, leave to be wretched.

GOLD.—The true *primum mobile* of the world.

HAPPINESS.—In the early language of China, the symbolic character denoting happiness is composed of two signs, one of which represents an open mouth, and the other a hand full of rice. But low and animalized as this conception of enjoyment is, is it not the prevailing idea, that “a man’s life consisteth in the abundance of the things which he possesseth,”—in a mouth filled with rice? And is not our own word “happiness” indicative that enjoyment is a thing of

mere *hap, luck, fortune*, rather than the necessary result of right principles—the certain consequence of holiness pursued on a plan?

IMAGES.—It has long been the fashion to heap all the odium of demolishing the old monumental and other ornaments of churches on the Puritans. Open almost any history of a church or a cathedral, and you will find that whatever legs, arms, or noses are wanting, are owing entirely to the sacrilegious mallets of “Cromwell’s soldiers.” Indeed, they appear never to have taken a single image by the nose. Now, the truth is, that every great religious revolution has been attended with demolitions of the kind in question. The heathen temples suffered at the hands of Christianity. The destruction of that wonder of the world, the temple of Ephesus, followed the secular triumph of Christianity. The Ephesian puritans, when authorized by the imperial edicts, very naturally rejoiced in the opportunity of insulting Diana; and some of them falsely deemed it piety to demolish the very ruin of her habitation. When, under the auspices of Constantine and Theodosius, churches were erected, the pagan temples were either despoiled of their ornaments, or else accommodated to the new worship. The im-

mense dome of Santa Sophia now rises from the columns of green jasper which originally stood in the temple of Diana, and which were taken down and brought to Constantinople by order of Justinian. Two pillars in the great church at Pisa were likewise transported from thence. So, again, the Reformation despoiled many of the Catholic churches, wherever Popery gave way to Protestantism. The Lutherans condemned the Calvinists for breaking the images in the Popish churches, looking on it as a species of sacrilege. The Puritans, therefore, may be regarded as merely attempting to complete what the Reformers had begun; but with this important improvement on the destructive process of their predecessors,—that they proceeded according to law; a law which, while it authorized the demolition of “all crucifixes, crosses, images,” &c., directed, at the same time, “who shall repair the places, and at whose charge;” and which forbade the destruction of “any image, picture, or coat of arms in glass, stone, or otherwise, set up or graven only for a monument of any king, prince, or nobleman, or other dead person, which hath not been commonly reputed or taken for a saint.” Whatever odium, then, attaches to the demolition-propensity imputed to the Puritans, should be about equally divided between them, the Reformers, the ancient Christians, and the great destroyer Time.

SITTINGS FOR MY PORTRAIT.

FOURTH SITTING.

I HAVE been sometimes struck with the applicability of terms of art to other and higher subjects, and their actual use in imparting moral instruction. This is not only a proof of the flexibility of language, but of the progress of truth. In the infancy of mankind the first efforts of the power of speech would undoubtedly be simply descriptive, as when, according to the scriptural record, the Almighty having formed out of the ground “every beast of the field, and every fowl of the air, and brought them unto Adam to see what he would call them: and whatsoever Adam called every living creature, that was the name thereof. And Adam gave names to all cattle, and to the fowl of the air, and to every beast of the field.” (Gen. ii. 19, 20.) So when the multiplication of the human species rendered it necessary to maintain intercourse with each other, the objects of surrounding nature became soon distinguished by particular names, and thus a current language was established. The primary use of words then was very simple; the secondary more complex, and adapted to convey general sentiments. Hence arose the employment of rhetorical figures, as simile, metaphor, and allegory; and the method of teaching by parables. It is obvious that the application of terms of art, to

which I have referred, to the purposes of moral instruction, is a branch or ramification of the parabolic method, and, when judiciously pursued, is capable of combining entertainment with the communication of knowledge; so that the mind, instead of being conducted along a beaten and barren road, is led to improvement by a path that lies through a flowery wilderness.

“Leaning too much: more upright if you please.”

That was a needful hint, and the reader will at once perceive how easily it might give birth to the preceding reflections.

To be *upright* then, in point of moral position, is of incalculable importance; though in painting the idea must not be carried too far. An attitude of ease is required; but not one that indicates indolence, or is too remote from the perpendicular; on the contrary, an approach to it, if stiffness be avoided, rather bespeaks a manly boldness and firmness of character. Reclining suggests the idea of effeminacy and voluptuousness; sitting or standing erect, of conscious integrity, commanding influence, and active purpose. Whatever the attitude of the body, however, the mind should be distinguished by rectitude—rectitude of principle and aim. How important is the

prayer of the royal psalmist, and how worthy of adoption—"Let integrity and uprightness preserve me, O Lord!" Let the individual who is sitting for his picture, if requested to assume an upright, or more upright position, avail himself of the request to begin some self-examination. Will there be really a portraiture or shadow of the mind in this representation? Is this very appearance calculated to impress upon the observer an idea of the true greatness—the firmness—the moral purity, or the moral heroism of the person portrayed? and is it, therefore, a correct delineation of myself, or a real index of my character? If I am mean, selfish, and sycophantic, ought I not rather to be exhibited in a stooping posture, and with an averted eye? Will posterity receive a right impression from the canvass; or is it rather what should be than what is?—If truth demands the admission of this to myself; if indeed it be the echo of my own consciousness, then let me begin to rectify my character. Let me realise the moral obligation to take a higher station, to aim at real and religious elevation. Let me dismiss servility and become sincere! Let me abandon the mere purposes of self-aggrandisement, or petty gain, or personal distinction, or indolent self-indulgence, and live for others, for my neighbourhood, my country, and my God! Let artifice, chicanery, deceit, and fraud, be far from me, and let me determine to cultivate uprightness of heart and conduct towards my fellow-creatures and my Maker; in worldly transactions being free from trickery; in religious ones without hypocrisy!

There is another term of painting which, however, may be usually more applied to the historical department of the art than to the formation of the individual figures, and the drawing of particular purposes, which is capable of a moral application; it is the term "design." In the grouping of large pictures, where a multitude of objects is to be introduced, and all conducing to the general effect, as well as to give a chronological impression of the age of a particular event, as well as the event itself, the *design* is every thing; nor even in an individual portrait is it to be overlooked, not only for reasons deducible from previous statements, but from the encompassing indication of consistency and harmony. It would be very *outré* to represent, for instance, a clergyman in his study in a sportsman's dress, or with dogs and implements of the chase, or a sportsman in the field with inkstand, books, and papers; and it is easy to conceive of incongruity and absurdity in less obtrusive forms. Hence it is common to speak of a *good design* or a *bad design*. There are two ways in which this valuable word may be applied: the one is strictly moral; the other incidentally so.

In the strictly moral sense it is descriptive of motive—of the spring and intention of an action. To *design well*, to be pure in purpose and aim, is

of great moment; for the consciousness of it will sweeten success and alleviate failure. It is true that the motive will not always justify the action, because an improper proceeding may be adopted from a good motive; but no action can be deemed morally good, the incentive to which is not virtuous or holy. Thus a bad design may vitiate what might otherwise be deemed a good action, and a good design might extenuate injudicious conduct. But in no case can there be moral worth without sound and undeniable principle.

From the more extended application of the term design in painting, another moral allusion may be seen contained in the use of the word in other cases and in a looser sense. The sketching and arrangement of a large picture, in the elementary outline of particular parts and figures, so as to transfer the artist's vivid conception to the canvass, afterwards to be wrought out and bodied forth, may suggest the necessity of early adopting a good design, a well-arranged plan of future life. The outline is a great point; the fillings-up are to follow in the course of every day. The outline will indeed be susceptible of continual corrections, and will require many alterations; but these may not prejudice the whole, and will be but the more perfect exemplification of the original thought. A plan for the future, even though it be but imperfectly formed and loosely sketched, is of great importance to the young. I have heard an old acquaintance of mine, who was justly celebrated for his deep and comprehensive views, talk of "a planless plan." This significant expression describes the unformed, unfixed varieties of purpose, the half formed crudities of the vacillating mind of the young person whose scheme of life is so vague, and shadowy, and uncertain, that, while he chooses a profession or a business, neglects to realise the proper object, and to pursue the steady and successful course. He is not without a plan, but it is an outline without unity of design, and without any well-digested idea of either the means or the end. If the schemes of youth may not be expected to be comprehensive, they should at least be carefully and steadily adopted. Too often this is left wholly to youth, who are guided at the outset by accident or prejudice—or no definable sentiment at all. Then is the time for the master hand of parental guidance, and the moulding power of a sound and successful education!

How often, in reference to painting, I find the term colouring employed! Light and shadow it seems are the grand staple commodities of the artist, but much, very much depends on the colouring of the picture. In a landscape and in a portrait, equally, truth to nature in this respect is essential. Whatever may be the other objects of research to the connoisseur, this is a circumstance which invariably strikes the eye of the common observer. His decision as to merit in the case is indeed of no

consequence, but the artist will do well to watch his impression; for a common man sees nature in the general as well as the painter, and he has a means of comparison at once before him. It is true the vulgar eye delights in gaudy colours; but still, however incompetent to produce an effect, there is often in the veriest novice a kind of intuitive perception of right and wrong in colour which is not to be despised. "That looks like a field," says he,—"That is just like old Church,"—or "That is not a bit like flesh and blood." I do not believe the colour of a Claude or a Sir Joshua is lost upon the eye of a scavenger.

The term "colouring," in the moral application of it, is very obvious and very momentous. The essence of lying may consist in that evasive and prevaricating language which, while it avoids the

direct assertion of what is false, misrepresents, exaggerates, adds, or conceals, in such a manner as to give a false *colouring* to facts. The general features of the case may be true, but the complexion of the whole is wrong; and what is wrong or false may be so dexterously put on and so distributed as entirely to mislead. It would be well if the traducer or the mischief-maker were to recollect that the evil inflicted is far less upon the misrepresented individual than upon himself: in the one instance, reputation may suffer; in the other, in his own case, character is deteriorated. The false colouring whisperer grossly deceives himself when he imagines he is working the ruin, for sport or for envy, of another: he is, for this world and the next, destroying himself! Y.

EGOTISM.

You may rely on it, reader, that nearly all the world, except you and I, are egotists; so that, by the bye, we ourselves must have had a very narrow escape. "But how is it, then," you inquire, "that so many pass for modest, unassuming men?" Why, it is simply thus: some men are much more accomplished egotists than others; they know when to attract notice by appearing to disregard it; when to change the first person singular into the second; and when to excite the surprise and concern of the sympathetic, by affecting an undue degree of self-dissatisfaction and self-severity. And some are much less egotistical than others. The principle of *egotiveness* is within them, but circumstances have prevented the development of the organ. And provided a man's propensity to self-exaltation be not very obtrusive, he is allowed, by a kind of common courtesy, to pass for a modest man. This is his premium for being what he is, and his bribe to remain so. He is but a pigmy compared with the giant egotists around him, and his reward is to pass unnoticed.

But look me out the man who appears most dispossessed of self, and transport him to some planet inhabited by beings guiltless of selfism, and you shall find that even he will prove to be an egotist in every world but his own. He was humble here only by comparison; but there, no one could doubt for a moment that he was of the earth—earthly. And why? because he would be always talking about *our* world, and the superiority of *our* habits and manners; and be disposed to take the lead in every planetary conversation; and aiming to excite astonishment by recitals of the marvellous.

But you need not transport him to a distant planet for this purpose: try the experiment on a smaller scale; track him through two or three days of his earthly wanderings, and you will find that however unassuming he may appear in some

circumstances, in others he can lay claim to all the privileges of a veteran egotist. Has he just terminated a journey rather longer than usual? Then hush: "I am Sir Oracle—let no dog bark." For one half hour, at least, he lays claim to your attention as the "leading article," though, perhaps, he has merely to relate, "how he went farther than he intended, and came safe home again." Has he been involved in a wordy war? Then he will astonish you with the point of his repartees, and with what "I said" to what "he said." But it is in his own family that his egotistical propensity is most conspicuous. And it must be acknowledged that here, if any where, it almost ceases to offend; here, indeed, it becomes almost amiable. He is, beyond dispute, the most important personage in the group; and his importance must be maintained. In the eyes of his children—those multiplications of himself—he is the strongest, the wisest, and the best of men. And in the heart of his *other self*, the dear idea of his superiority is enshrined till death. But this pleasing delusion, which seems almost necessary to domestic happiness, cannot be maintained without the occasional declension of *ego*. And let him egotize, reader; he offends neither you nor me. I envy him his auditors; and let him who would attempt to dissipate the grateful error be anathematized, and never allowed to graduate beyond a bachelor.

But who is not an egotist in his dreams? I cannot forbear venturing an opinion that even you, reader, though of so retiring a disposition while awake, and while your thoughts are under the eye of a vigilant judgment, no sooner lose yourself in the vagaries of a dream, than you become the hero of every scene which your imagination portrays. You may dream of others; but then they are only admiring spectators of your exploits. You may quarrel; but your antagonist never fails to be worsted. The drama

suddenly changes, and a new scene makes its appearance; but you are there in time to sustain the principal part. You dream of precipices, and of persons falling over them; but rather than be a mere spectator, you will fall from the highest point yourself. But this modification of egotism is excusable; you were beguiled into it during the absence of all mental control. If, indeed, as many do, you were accustomed to relate your dreams, then, perhaps—but away with the ideal! it is not for a moment to be entertained.

It is said that an extra glass will occasionally transform a very reserved person into a most loquacious egotist, if into nothing worse;—that it has a strong tendency to revive the memory of personal adventures, respectable connexions, and rich relations. But however this may be, it must be allowed that a slight degree of personal deference, to say nothing of adulation, will frequently operate to this effect. When a man perceives that you know him, and that you regard him (perhaps justly) with marked and respectful attention, he feels that he has to support a certain character, and rather than sink in your estimation, he is in extreme danger of contracting the guilt of egotism. This will, in some measure, account for the fact why so many men of mental eminence are chargeable with the commission of this offence. For be it remembered, that whatever it may betray, it is a propensity by no means peculiar to mental imbecility. They have been placed in circumstances of this description so often, that a feeling of self-importance has been first generated, and this, by repetition, has gradually led to a habit of self-exaltation. Hence Cicero became an egotist, though he was evidently most anxious to conceal it; and Montaigne, who wrote *I* more frequently than any other letter of the alphabet; and Wolsey, whose motto of "*I and my king*," renders him an example worthy the attention of every succeeding egotist. And why should thy name be omitted, Cobbett? thou prince of egots! thou whose every page breathes self-inspiration, and the most enviable degree of self-satisfaction. This, too, will partially account for the publication of so many trips and travels, conversations, reminiscences, autobiographies, and a variety of nameless effusions, "at the request of friends." And why will it not equally account for the slight degree of egotism attributable to honest John Bull? He boasts "a constitution which is the envy of surrounding nations, and the admiration of the world." And when it is remembered that many compliments to this effect have reached his patriotic ear, it is not strange that he should believe it. And when, in addition to this, the character and pretensions of his southern neighbours are remembered, it is not strange that he should so far throw off his natural reserve as to assert it, and thus turn egotist in self-defence.

I once knew a thorough-paced egotist, and I

would not willingly part with the idea which I retain of him. It was the fulness, the perfection of his egotism alone which rendered *I*—s supportable. Had he been less egotistical he would have been intolerable, simply because he would not have appeared incurable. Had he occasionally descended from his stilts, his friends might have cherished a hope that he might be gradually taught to walk upon the earth; but he never disappointed their hopes, for he never excited any. Had he occasionally enjoyed a lucid interval, an attempt might have been made at exorcism; but the demon of egotism never left him, so that no one could hesitate to pronounce him an incurable. It was scarcely possible to offend him by any of the ordinary means of giving offence. Convict him of ignorance; his self-confidence remained unshaken: he felt assured "in his own mind," that he had read or heard to the effect of what he had stated; or, he was not in the habit of forming an opinion hastily, nor should he be hasty in relinquishing it. Politely request him to withdraw; he evidently pitied you for defrauding yourself of the pleasure of his company. Tax him with egotism; he professed to hate nothing so cordially. But if it was difficult to displease him, it was a proverbial impossibility to put him on indifferent terms with himself. If he ever admitted, for a moment, that he could, in any single point, be more perfect than he was, it was done so blandly, with so many alleviating expressions and assurances of self-esteem, that he could not possibly be offended with himself; and, moreover, it was always the certain forerunner of invidious comparisons with those around him, and ended in torrents of self-gratulation. He was a happy instance of the principle of gravitation, for he was his own centre, and to that he tended with a constancy and force of determination which nothing external could ever disturb—

"And *I*—s, self-balanced, on his centre hung."

In conversation he quoted principally from himself, as a classical scholar would from the ancients; for few sayings had ever escaped from his lips which his memory had not embalmed with the most pious solicitude. In a doubtful question he seldom appealed to a higher authority than himself, which he did with the readiness and accuracy of a lawyer appealing to an old act of parliament; naming the date when he had formed the opinion or used the expression alluded to, together with the minutest circumstances which led to it. Few incidents of modern times could be mentioned in conversation of which he had not some knowledge, which called for the attention of the company. But whenever he condescended to refer to an incident which did not relate immediately to himself, he commonly atoned for the defect by giving a most detailed account of the several stages through which it had passed before it reached him—the depository

of all knowledge and secrets, past, present, and to come. And in doing this, he generally managed to introduce, indirectly, a few names and circumstances, intended, if not calculated, to raise him in the opinion of those he addressed, so that, before he had concluded, the original incident was entirely lost sight of, and you found yourself brought back to that beginning and end of all things—*himself*. And yet there is not one of his acquaintance—friends, I believe, he has none—who would not devour his Memoirs, provided they were written by himself, as the choicest morsel which ever gratified their literary palate. But such a pleasure is not to be expected; for unless he could be present at the reading of every copy which might be sold, to announce himself as the hero, and to offer any little explanation

which he might deem necessary, he would never think of the publication. Farewell, then, thou worthy archetype of the egotistical tribe, farewell! and accept, at parting, this feeble tribute to thy cherished memory. Never shall it be said that thou art self-irreverent; for seldom dost thou pronounce thy name but with an emphasis approaching to awe, or offer incense at any human shrine but thine own. Thou art self-canonized. Never can it be said that thou lackest a subject for conversation; for thou art so full of thyself, that it is only to address thee, and thou overflowest. Never, whilst thou livest, canst thou be taxed with forgetting the object which first engrossed thy affections; for thy "first love" was thyself, and thou wilt love on till death.

MY RUSHLIGHT.

My theme is not a very bright one—
Rushlights are queerish things to write on—
But I must praise this ragamuffin,
Because, d'ye see, he do'nt want snuffing,
And that is more than I could say
Of *all* the lights I've seen to-day.

My rushlight cost just half a penny—
'Twas worth that sum to me or any:—
A farthing used to be the value
Of all its ancestors, I tell you :
But now, when the whole world's improving,
My rushlight, too, is onward moving :
'Tis worth just double its grandfather,
And *that*, you know, 's uncommon, rather :
At least 'tis more than I could say
Of *all* the lights I've seen to-day.

This feeble rush, though oft despised,
And scarcely ever too much prized,
Is of some use—no man can doubt it—
This dark world would be worse without it.
It aids the sick, befriends the wretched,
And, if 'tis absent, must be fetched :—
For nurse would "make a fuss" about it,
And could not "find the pills" without it.
Then rich and poor alike must use it :
It gives both light, though both abuse it.
Midst scoffs, and jeers, and gibes ungrateful,
Without revenging things so hateful,
It still shines on, and lights the haughty,
Who censure it in modes so naughty.
It does *its best*—that's more than they do,
And longer burns than lights more gay do.
And this is what I would not say
Of *all* the lights I've seen to-day.

My rushlight, too, is very *modest* :
Of all its virtues this is oddest ;
But 'tis so bashful when first lighted,
You'd think the timid thing benighted ;

Then nought but time and care most tender
Encourage it to show its splendour ;
And, at the most, its whole pretension
Does not provoke our reprehension ;
And that is more than I could say
Of *all* the lights I've seen to-day.

My rushlight also merits praises,
And must be sung in grateful phrases ;
Because it has that happy talent—
For self-defects an equivalent—
Of setting brighter lights a-burning,
(A secret worth a *parson's* learning :)
'Twill make a lamp, or gaslight glitter,—
For *this* wax candle's scarcely fitter—
'Twill serve to light the peasant's fire,
Or peasant's master's—so much higher :
E'en "moulds" or "fours" could do no better :
I tell you truth, mind, to the letter.
And when 't has done the deed so nicely,
'Tis modest, as before, precisely :
Not proud because it could be useful,
Not clever first, and then abusive ;
It still remains quite unassuming,
Avoiding vain and idle fuming,
Although it *have* perform'd a wonder—
Now, this is fact, and here's no blunder :
Though it be more than I could say
Of *all* the lights I've seen to-day.

And when the rushlight's done, 'twill go out,
(There's nothing puts one's temper so out
As to be for'd to rise, to blow out
The cotton snuff which fumes so badly,
And makes one cough so very sadly :)
So I must praise retiring beauty,
Which *leaves*, when it has done its duty,
And do'nt pretend to shine *for ever*,
(As if it could be always clever) :
But, when it can no longer charm us,
At once departs, and does not harm us,
For this is praise I could not say
Of *all* the lights I've seen to-day.

W.

REVIEW.

Education Reform; or, the Necessity of a National System of Education. By T. WYRE, Esq., M. P.
Vol. I. London.

We take it for granted that there are numbers still who are as hostile to universal education as ever. We say we assume this as a matter of course; and our

reason for doing so is, that until education becomes universal, all the uneducated will not know what education means; and under this class we unhesitatingly rank all anti-educationists. They exemplify how necessary education is, by rendering themselves the greatest obstacles to it.

It is high time, however, that all such should be apprized that, willing or unwilling, education is no longer optional; it cannot be stopped; it is inevitable. "I wonder not much, considering what human nature is," says Archbishop Whately, "that some should think the education of the poor an evil; I do wonder at their not perceiving it to be inevitable." Yes, "Forward!" is the strong cry of the human heart; and every thing in the present day echoes it back. This may not, as our author remarks, at first be perceptible. The valleys may still seem to sleep in darkness, but the day is on the high places; the noonday sun will, ere long, be felt in their deepest depths. These are not vague anticipations; they are statistical as well as metaphysical facts. Indifferent as our education still is—limited as it is—it still evinces a great increase in numbers, and a still greater improvement in discipline. Proselytism, religious and political, has every where pressed into its service the new power. It is perceptible in every walk of life. The club, the reading-room, the newspaper, the magazine, the mechanics' institute, the public meeting, are all educators. In every transaction the schoolmaster's voice, loud or low, is heard. And not only all classes, all nations are under its influence; and the effective communion of nations has commenced. We are gradually forming a large European family: whatever vibrates at one extremity is felt at the other. We cannot, if we would, live by ourselves. The thoughts and words of others burn and speak in us, even when must we believe ourselves alone. The whole world is hurrying on: if one class would prevent another pressing and trampling on them, the only way to effect it, is to press onward themselves. In vain is it, then, to discuss whether education be a good or an evil; in vain to spend time in framing statistical tables to ascertain whether a state of education or of non-education be the more favourable to social morality. Educated the people will be; the only question left open is, whether their education shall be good or bad.

But besides being inevitable, education has become more than ever necessary. The Reform Bill is law; the people are now masters of their own destinies. Instruction has become indispensable. Every man ought to be educated up to the level of the functions to which his country and his situation call him. One man taught, soon becomes the teacher of another. From one centre, knowledge radiates in a thousand directions. The man who has learnt to discharge one duty well, will equally well, with proportionate care and opportunities, discharge another. And thus education might easily be shown to be not only necessary, but also a benefit and a right. Now with these impressions, the object of Mr. Wyse in the present volume is to develop these three propositions:—that national education should be good,—universal,—and be provided with means for its permanent support. And though we may demur to some of his positions we feel gratified in saying that he has brought to the momentous subject a great fund of information, comprehensive views of the philosophy of education, and an earnestness of purpose which invests the whole with surpassing interest. His style exhibits considerable point and vigour; and most of his pages teem with reflection. He is obviously a man of and for the times. "What, then," he inquires, "is good education?" The best means we can devise for preparing the future man for the ends destined by the Creator. But what are these ends? Upon the solution of this question depend the means. We must know whither we are

going before we can decide what road we are to take.

We must know in what education proposes to terminate, before we decide what should be the nature of our education. Some have proposed, as ends, the development and perfection of our faculties; but this is mistaking means for ends, it is stopping short on the road. Others, again, have proposed utility; but this conceals an ulterior term—what is utility? "The greatest happiness of the greatest number." Happiness, then, is the end of education; but what is happiness? From the time of ancient philosophy to the present day, this has been the great object proposed to the hopes and passions, spiritual or physical, of our nature.

But were happiness alone the end—or even the end *par excellence*—either of human life or of education, we should, on an impartial examination, be compelled to confess that it is an end which has scarcely ever been attained. Happiness on this earth exists only by comparison; it is not, nor can it be, an absolute, a fixed quality. It is a mere motion to some other happiness beyond it; and just in proportion to the distribution of this motion through our earthly existence, is the measure, great or small, of our earthly enjoyment.

But to mistake this for the end of being would be fatal. Philosophy, it is true, teaches that there is a happiness which is independent of worldly rewards, and often in contrast to them.

"Philosophy teaches that true happiness and true utility can only combine with virtue; that even nature avenges herself for the abuses of her gifts; that, on the most refined calculation of selfishness, there is wisdom in self-subjugation; and, in economising pleasure, a certain though late reward. But, after all, what is this but prudence? And what, even at its highest value, is prudence? Prudence, by itself, in the moral world, has no fixed value; it derives all its worth from the impression it receives. It may be found as often in the service of vice as of virtue; and just as great a check upon the one as upon the other. It is, after all, a more purified species of egotism; it ends where it begins. Utilitarianism, indeed, has endeavoured to raise it from this earthly origin; and, by embracing mankind, to divest it of its purely personal characteristics. It thus partakes of a somewhat more elevated morality; but then it is a morality recommended, not enforced. There is no secondariness of the external law in the human breast, no utilitarian conscience. As long as such is the case, self-sacrifice—the individual for the mass—may be preached, but it will not be practised. The interests of society may be said to be conformable to those of the individual; but what are these interests? We must look for something certain, something here to-day, but not gone to-morrow. But is this to be found? Undoubtedly God has not commanded impossibilities; nor sent us into creation without a path or purpose—a medley only of doubts and contingencies. There is an end, and there are means, (though not those already mentioned,) both clear, both decisive. Perfection, through the performance of duty, is the great end of all education."—(Pp. 37-38.)

Such is the nature of the education which is necessary, and which *must* be imparted to the people at large. The people are entrusted with power: shall that power be left in the hands of ignorance? Shall the most important interests be confided to the mere instincts, the coarse passions, the blind impulses of an unenlightened community? We are not in times when we can afford to trifle with such forces, ranging at will through society. It is an electric stream, which must be conducted or turned aside. Great skill, the purest intentions, a very high improvement in our mental and moral capacity, are essential. And this can be effected. The rising nation, young Britain, still is ours; we hold its social destinies in our hands; we may cultivate in the child the future man. We are the accountable guardians of their virtues and their happiness; the creators, under God, of their characters; we are they who are to decide, even now, whether they shall be the future criminals or the future benefactors of our common country. But we have no right to erect gibbets, if we will not take the means of preserving from them; we have no right to punish ignorance and vice when our institutions have led in no other direction.

MEN AND THINGS.

THE SMITHS.—It is a well-known fact, that the thriving family of "Smiths" have always held the predominance over any other that has been established since the Norman conquest; whether it be attributable to their extraordinary progenital powers, or to a public preference of the monosyllable cognomen, is not known. A curious packet, however, which was delivered some time ago, shows how frequently this name is made use of. On two bags of flour the direction ran thus:—"Mr. William Smith, of Carlton. From Mr. William Smith, of Southwell. By William Smith, the Newark carrier. To be left at Mr. William Smith's, the Crown Inn, Newark, till called for." It may be necessary to observe, that each of these names refers to a different person.

ECONOMY OF TIME.—In England time, is a revenue, a treasure, an inestimable commodity. The Englishman is not covetous of money, but he is supremely covetous of time. It is wonderful how exactly the English keep to their appointments. They take out their watch, regulate it by that of their friend, and are punctual at the place and hour. English pronunciation itself seems invented to save time; they eat the letters and whistle the words. Thus Voltaire had some reason to say, "The English gain two hours a-day more than we do by eating their syllables." The English use few compliments, because they are a loss of time; they salute in a nod, or, at the utmost, a corrosion of the four monosyllables, "How d'ye do?" The ends of the letters always show more simplicity than ceremony; they have not "the honour to repeat the protestations of their distinguished regard and profound consideration" to his "most illustrious lordship," whose "most humble, most devoted, and most obsequious servants" they "have the honour to be." Their very language seems to be in a hurry; since it is in a great part composed of monosyllables, and two of them, again, are often run into one; the great quantity of monosyllables looks like an abridged way of writing, a kind of short-hand. The English talk little, I suppose that they may not lose time; it is natural, therefore, that a nation that sets the highest value upon time should make the best chronometers, and that all, even among the poorer classes, should be provided with watches. The mail-coach guards have chronometers worth eighty pounds sterling, because they must take care never to arrive five minutes past the hour appointed. At the place of their destination, relations, friends, and servants are already collected to receive passengers and parcels. When a machine is so complicated as England is, it is essential for every thing to be exact, or the confusion would be ruinous.—*Pecchio's Observations on England.*

PETER THE GREAT.—This eminent man being once at a town in Poland, heard much of a wonderful image of the holy Virgin, which had been seen to shed tears during the celebration of the mass, and he resolved to examine this extraordinary miracle. The image being highly elevated he asked for a ladder, ascended it, and approached close to the image. He discovered two little holes near the eyes. He put his hand to the head-dress, and lifted up the hair with a portion of the skull. The monks, who stood at the foot of the ladder, quietly regarded the czar, for they did not imagine he could so soon discover the fraud. The emperor discovered within the head a basin; it was so placed that the motion of a small fish which it contained agitated the water, and occasioned it to issue slowly, and by small quantities, from the two apertures at the corner of each eye. He descended the ladder without seeking to undeceive the devotees or any one; but, addressing himself to the monks, he

said coolly to them, "That is a very curious image indeed."

AN ANXIOUS INQUIRER.—It is related of a lady resident in Montgomeryshire, and now somewhat advanced in years, that, in her early days, she had lived so secluded from the world, that, to her knowledge, she had never seen the bounding goat which frequents the mountains of her native land. When about the age of eighteen, it was proposed that she should accompany a friend to London. The invitation was accepted with delight, and day after day did she listen in wondering anxiety to the accounts of the varying sights which were to be presented to her astonished mind. But there was a remark which she overheard, and which made an impression on her mind not easily to be effaced; it was, that the only objection which Mr. — had to going to London was, the dread of the bugs which abounded there. On the approach to the metropolis, eagerly did Miss — gaze upon the passing wonders, till suddenly seizing hold of the arm of her friend, she exclaimed, "Dear Mr. T., is that a bug!" at the same time pointing to a huge goat which was being led through the streets, accompanied by a large crowd of children.

SPECTACLES.—The origin of these valuable instruments is uncertain. That the ancients were acquainted with the laws of refraction, is beyond all doubt, since they made use of glass globes filled with water to produce combustion; and in Seneca we find the following very curious passage:—"Litteræ, quamvis minutæ et obsecræ, per vitream pilam aquâ plenam majores clarioremque cernuntur." Yet thirteen centuries elapsed ere spectacles were known. It is supposed that they were first invented by Salvinio, or Salvinio Armati; but he kept his discovery secret until Alessandro de Spina, a monk in Pisa, brought them into use, in 1313. Salvinio was considered their inventor, from the epitaph on his tomb in the cathedral church in Florence: "*Qui giace Salvinio d'Armatò, degl'Armato di Firenze, inventor delli occhiali, &c.. 1817.*" Another circumstance seems to add weight to this presumption. —Luigi Sigoli, a contemporary artist, in a painting of the circumcision, represents the high-priest Simeon with a pair of spectacles, which, from his advanced age, it was supposed he might have needed on the occasion.—*Millengen's Curiosities of Medical Experience.*

NINE OF DIAMONDS.—In playing-cards, the nine of diamonds is commonly nicknamed "the curse of Scotland," and several reasons have been assigned for this strange denomination. When the Duke of York, who was shortly after James II., took up his residence at Edinburgh, and enlarged the palace of Holyrood, he and his court introduced a new game there, called "Comet," in which the nine of diamonds was the most important card. The Scots, who had to learn the game, lost tremendous sums at it, and from that circumstance the nine of diamonds was called the curse of Scotland. Another derivation is, that the nine of diamonds bore some resemblance to the arms of the Dalrymples; and that Lord Stair, a member of that family, was the real curse of Scotland. But a third derivation is more modern, and much more striking, though we cannot take upon ourselves to decide that it is the most correct or the right one. It is said that the night before the fatal battle of Culloden, the Duke of Cumberland sent orders to General Campbell to give no quarter to the soldiers of the Pretender;—that this order being despatched in great haste, happened to be written on a card, and that card the nine of diamonds; from which time and circumstance it has gone by the appellation of the "curse of Scotland."

A TALE OF THE INN KITCHEN.

DURING a continuation of deep snow, which formed an impenetrable barrier to the neighbouring roads, a few travellers were assembled at a village inn; good ale and porter foamed in the landlord's cellars, and the larder was well stocked with provisions, so that there was no danger of starvation, even though the besieging elements from without threatened a long blockade. Amusement was not so easily obtained; the company accidentally assembled in the kitchen of the inn, the only place of congress that the dwelling afforded, were of different ranks and situations in life, and nothing like general conversation could be established in the society. The same expedient by which persons in similar circumstances have, from the time of Boccaccio beguiled the lagging hours, was resorted to upon this occasion; and it was unanimously agreed that every individual should relate a story in turn. Desirous of promoting good fellowship, one of the party readily undertook to lead the way, and, drawing their chairs round the fire, the rest of the company prepared to listen attentively to the gentleman's tale of the gamekeeper's daughter:—

A younger child, neglected by my family, and ill-treated by the mercenaries to whose care I was committed, I felt no regret at leaving my native country at the tender age of fifteen. My parents parted from me without exhibiting any appearance of sorrow, desiring me to behave well for my own sake, and to get rich for theirs; and, promising to act according to this prudent counsel, I embarked as a cadet on board an Indian, in all the fearless confidence of youth, hoping that a change of scene would bring an accession of pleasures, and rejoicing in the idea that I should be my own master. On my landing in India I wrote to inform my father of my arrival; but never receiving any reply to this and various other letters, which I considered it to be my duty to address to my family, in the course of a few years I ceased to trouble them with my epistles.

A studious disposition, and a quick perception of the beauties of virtue, in some measure supplied the defects of my education; and manfully withstanding the various temptations with which I was surrounded, I preserved a simple taste in the midst of luxury. The regiment to which I was attached being stationed in the Upper Provinces, I had little opportunity of mixing with Europeans, or of gaining any knowledge of the world, except from books. My own recollections of England were faint and indistinct; but the descriptions of the poets revived in my mind visions of Arcadia. Often, in my solitary rambles through vast and almost impervious forests, as I gazed upon the stupendous productions of the

clime—a herd of elephants reposing under the shade of a mighty banian, and the tremendous boa winding its tortuous course round the gigantic trunks of the patriarchs of the soil; or turned from the contemplation of these astonishing works of nature to admire the living gems floating in the sunshine, the ruby and amethyst of the lory, the brilliant emerald of the slender paroquet, and the gorgeous constellation of the many-coloured peacock, perched in myriads upon the branches of trees of a thousand scents and hues—my mind wandered from this scene of magnificence, to feast upon the pictures which fancy drew of my native country, and imagination aided memory in recalling the sweet haunts of my infancy, the green lane leading to the mazy labyrinths of my grandfather's park, where, stretched upon the cool sward, I listened to the melodious trillings of the thrush, watched the playful antics of the squirrel, or, roused by the sudden flight of a fawn, bounded along the gem-enamelled earth with a step as agile and as fleet. How gladly would I have exchanged the luxurious collation which awaited my return, the baskets of pomegranates, limes, cocoas, and pine-apples, for one ripe rich cluster of hazel nuts, won by the active labours of a vigorous frame from the topmost bough of the sheltering hedge-row; or a solitary wood strawberry, which untiring search had detected amid the cunningly wrought tapestry of a bank of wild flowers.

Unblessed by friend or relative upon whom I could lavish the affections of a naturally tender heart, every emotion of love was centered upon the land that gave me birth; my soul yearned towards it; and whenever, subdued by the enervating heat, I lay faint and exhausted on a bed of sickness, the cool climate suggested a remedy for all my ills, and seemed only necessary to restore my strength, and quench the parching fever in my veins. My ardent desire to return home grew upon me every day and hour of my existence: twelve years had passed away, yet a dreary period was still to elapse ere I could reasonably entertain a hope that my own savings would enable me to visit my native country. I had already realized sufficient money to defray my expenses home, but as I could not reckon upon a welcome from my family unless I came amply provided against the chance of becoming burdensome to them, I was compelled to struggle with my wishes, and endeavour to be content to spend the summer of my life in India. Owing to a variety of accidents I had not even seen an English newspaper for several months: the arrival of an immense packet promised a fund of entertainment; and, arranging them according to their dates, I sat down eagerly to the perusal. My attention was soon fixed upon a paragraph which

concerned me deeply: it announced the deaths of no less than seven of my nearest relations; and, in commenting upon this extraordinary mortality in one family, stated, that the only individual who was supposed to be alive was a lieutenant in a native regiment in India; and now, in consequence, heir to considerable possessions. Though the natural ties of affection had been early snapped, and long absence had rendered me a stranger to my father's house, I could not learn the total extinction of all my race without experiencing poignant grief; and the feeling that I stood alone in the world gave a melancholy tinge to my mind that it never entirely recovered; the forlorn friendlessness of my situation was only increased in idea, for neglect and distance had as effectually separated me from my kindred as we were now divided by death.

Instantly relinquishing my commission in the Company's service, where a life of long inaction had rendered me hopeless of attaining military glory, I procured from the Governor of India such proofs of my identity as I considered to be necessary for the establishment of my claims, and set sail for England. My voyage was retarded by a series of disasters; the ship suffered so much damage from a storm, that we encountered in the Indian Seas, that we were obliged to make for the Isle of Bourbon, and the vessel being there condemned as unseaworthy, after suffering considerable delay, I took my passage on board a small schooner, on the point of sailing for England. Unfortunately, parting from our convoy in a heavy fog, we were chased by a French privateer, and after a long run we were taken prisoners. At the moment that I nearly despaired of ever revisiting my native country, our captors were surprised by a sloop of war in disguise, who, suddenly showing her guns and her colours, changed the posture of our affairs, and we again trod upon a British deck.

On leaving India, I intended on my arrival in England to proceed directly to London; but languishing for repose, and weary from the accidents of my tedious voyage, I requested to be set on shore on the coast of Cornwall, and landed within twenty miles of my own estate. I felt not the desolation of my situation, for every inanimate object that I beheld appeared to be a friend; my long confinement on board ship rendered the enjoyment of air and exercise too luxurious to permit the intrusion of any less pleasurable sensation, and I looked not for other welcome than that which the earth, the air, the sunshine, and the smiling landscape seemed to give me. My heart beat tumultuously as I approached the demesne of my forefathers. Turning an abrupt angle in the road, the paternal estate burst upon my view; the chimneys of a long irregular building just peeped from above the trees, which, clothing the side of an easy declivity,

gradually decreased in size, until the encroaching sand of the seashore effectually checked vegetation. Symptoms of long neglect were observable the instant I entered the park: the porter's lodge was tenantless, and the road, overgrown with moss and weeds, was entirely destitute of the trace of a single wheel; the deer, struck with a panic, fled at my approach; and, disturbed by the hollow sound of my horse's hoofs, a cloud of rooks rose from their aerial city in the over-arching elms, and filled the air with their clamorous voices; the front of the house was completely shut up, not a cranny or a fissure in any one of the windows gave evidence of inhabitants; but a slender column of smoke, issuing from a low chimney in one of the offices, guided me to an open door; and, fastening my horse to a post, I entered unannounced. I had not penetrated far into the interior of the mansion ere I encountered an old woman, who, with a voice corresponding in asperity to the sourness of her aspect, demanded my name and business in a dialect which I could scarcely understand. I briefly informed her that I had arrived from India to take possession of my house. Apparently not inclined to credit my statement, she began to bawl out the name of Jarvis, and presently an old man made his appearance, not a whit more prepossessing in his person and manners than his fair companion; this redoubtable personage seemed also disposed to dispute my entrance, and comprehending but little of their jargon, I assumed such a tone and attitude as speedily convinced them of my determination to support my rights, and, though with evident reluctance, they prepared to obey my commands. Demanding the keys of all the apartments, I removed the shutters, and derived a melancholy satisfaction in gazing upon the portraits of my family, with which the walls were hung; and though a very trifling share of tenderness was due from the alien they had so long neglected, I could not contemplate those faded representations of relatives now in the grave, without experiencing considerable emotion. The generality of the rooms were spacious, old-fashioned, and ill-furnished, but the extensive sea views, and the picturesque inland prospects that the windows afforded, more than compensated for their internal gloominess; not one exhibited marks of recent habitation, except a large hall, which was spread with the remnants of a rude feast. Flagons and glasses were confusedly strewn upon the table, and candles, burnt into their sockets, denoted that the company had kept up their orgies until a late hour.

In reply to my questions, the old woman answered doggedly, that the supper had taken place at the funeral of the last owner of the mansion, and that she had too much to do to keep the rooms in order. I recked little whether her statement was correct or not, and choosing a bed-chamber that pleased me, and the library for

a sitting-room, I informed my domestics of my intention of taking up my abode in them immediately. It was in vain that they started objections: I bestirred myself so heartily in the affair, that finding it impossible for them to conceal their stores from my knowledge, (for, threatening me with starvation, I was obliged to detect bread, meat, wine, and faggots, with the vigilance of a Margaretta,) they furnished me reluctantly with fire and food. Towards evening a boy arrived with my baggage, from the village where I had hired my horse, and in a few hours I was completely settled.

It was nearly the end of September, and sitting close to an excellent fire, I amused myself with a volume of Shakspeare; pausing every few minutes to enjoy the contrast of my present apartment to my Indian bungalow, where it was only by the aid of fans, slaves, and punkies that I contrived to breathe. Whilst I was thus employed, not using much ceremony in the mode of his entrance, a tall, strong-built man, dressed in a fustian jacket, leathern gaiters, and a pouch and short belt slung across his shoulders, interrupted my meditations; he informed me that he filled the office of gamekeeper, and begged to know who I was. Hard-featured and sun-burnt, yet strikingly handsome,

"His face was of that doubtful kind
That wins the eye, but not the mind;"

but as his request was reasonable, and his manners superior to the Sycorax and Cerberus of my establishment, I condescended to show him such proofs of my right as produced a visible change in his deportment; yet his civility seemed assumed, not natural, and there was a sly and sinister expression in his countenance that ill accorded with the ideas which I had formed of the open, honest brows of English peasants. Fearing that my Indian habits would lead me to expect more deference than was due to a mere country gentleman, I perhaps overlooked much that struck me as bordering upon insolence, and finding this fellow to be more intelligent than any one I had hitherto conversed with, I put several questions to him, which he readily solved. He told me that the executors of my grandfather, who had outlived all his children, except myself, resided in London, and that during the two years which had elapsed since his death, an attorney in a neighbouring town had acted as agent to the estate. This man, he informed me, was absent upon some business in an adjoining county; and indulging a disposition which was at once active and indolent, I determined to await his return before I wrote to London.

Bartley, the keeper, came to me the next morning by appointment, and we set out upon a shooting expedition, attended by a person whom he introduced as the bailiff, one of the most villainous looking monsters I had ever beheld; he was short

and squat, his features distorted, and his skin seamed with the small pox; diminutive, ferret eyes, gleaming with a horrible expression of malignity, were half hidden by the shapeless mass of livid flesh that nature had bestowed upon him for a face; his manners were ferocious and disgusting. Delighted with the exercise, but not very well pleased with my companions, I told them that I should dispense with their services in future, and pursue my sport alone. This measure, however did not appear to meet with Bartley's approbation: he told me that it would be dangerous for me to wander about without a guide, for that a great number of guns and traps were set in the covers. Accustomed to penetrate jungles infested with tigers, to drink at the pool in the teeth of the alligator, and tread carelessly by the nest of the cobra di capella, it was not easy to alarm my fears, and perceiving evidently that he was desirous that I should only visit such parts of the manor as suited his fancy or convenience, and not admiring the sort of restraint which he wished to place upon my actions, I gave him to understand that I could not submit to reign as king with a viceroy over me, and dismissing him and his satellite rambled about as I listed. Having happily achieved a riddance of my Rosenkrantz and Guildenstern whose frequent looks of intelligence I observed and disapproved, without troubling myself to guess their meaning, the pursuit of game was a secondary object: my chief pleasure consisted in exploring the most sequestered parts of my estate, climbing the rocks that skirted the seashore, and penetrating their cavernous recesses. The scenery was bold and wild: the profound solitude of a country which for many miles scarcely betrayed a human habitation, suited the morbid melancholy of my mind. At night I again sallied forth: this was to me the season of enchantment: I loved to contemplate the ocean sleeping in the moonlight, to see the slender stag stretched upon a bed of daisies, beneath the umbrageous shelter of an embowering oak; to view the fantastic appearance the rocks and groves assumed, their prominent points bathed in the mild light of the moonbeams, and the lesser beauties that the garish blaze of day revealed, buried in impenetrable obscurity; to fancy lagoons and lakes in the blue vapour that covered the valleys, to watch the wheeling circles of the bat, to follow the owl as she dived into the thickest darkness of the wood, and to listen to the sweet plaint of the nightingale, whom my Asiatic imagination decked with all its oriental attributes. Time passed away, and though I had determined to await the arrival of Dawson the attorney, I know not whether I should have grown tired of this solitary mode of life, if my curiosity had not been awakened by a circumstance, which, to my romantic disposition, was more than sufficient to create the strongest interest. My dislike to the society of Mr. Bartley, had rendered me rather

shy of approaching his dwelling, even though the anxiety which he always manifested to keep me at a distance from it might have outweighed my prejudices. One morning, a long chase after an animal, which I was desirous to take alive, brought me unexpectedly to a copse that skirted his garden. Panting with fatigue, I flung myself down upon the turf to rest; whilst in this recumbent attitude, I perceived a volume which I had missed from the set of Shakspeare in my library, lying on the grass beside me, and the next moment the sweetest voice I had ever heard, warbled the beautiful old song,

"Come, live with me and be my love!"

I held my breath, fearing to lose a single note, and when it ceased, I rose cautiously from the ground and sought to discover the songstress; she was no where to be seen. Not easily discouraged, I walked round to the garden, and framing a ready excuse for my visit, entered the house. A stout, vulgar-looking girl was busily employed in cooking, but from her barbarous dialect I could learn nothing, except that her master was out. I lingered until I was fatigued with vain endeavours to comprehend the unintelligible sounds that grated on my ear, from a voice hoarse as the raven's croak, and then returned home to ponder upon my adventure. From this moment the game-keeper's cottage became the grand point of attraction: it was situated under the brow of a rocky cliff, and seemed from its close vicinity to the beach better calculated for the residence of a fisherman, than for one whose occupation would have been pursued with less fatigue in a more central habitation. A high ledge of rocks concealed it from view on the ocean side, and the copse, which I have before mentioned, formed a screen that effectually guarded it from the eye of an accidental passenger on land; my ear was frequently regaled by the enchanting strains of the invisible melodist, but once only I caught a glimpse of white drapery vanishing amid the rocks; the disappointment of my hopes only rendered me more eager in the pursuit, and day and night I haunted the scene which had raised a new and strange sensation in my bosom. One evening when I returned home, rather fatigued from an unsuccessful ramble, I found a volume which I had left open upon my library table, closed, and the leaf marked with a paper folded in the shape of a letter. The billet contained the following lines, neatly written in a female hand: "You are surrounded by dangers; reject not my warning, but instantly quit the country and proceed to London, where alone you will be safe until you have established your claims. I dare not be more explicit, but I again entreat you to depart: you are treading upon the brink of a precipice, and your life will be the sacrifice if you linger in the midst of perils until the return of Dawson, or continue your nocturnal amusements."

Unable to comprehend the nature of those dangers to which my fair correspondent alluded, and certainly not inclined to fly at the first hint that my life was in jeopardy, courage or foolhardiness (for it may be termed either) prompted me to sally out in despite of the remonstrance I had just received; and concealing a brace of pistols in my bosom, I wrapped myself up in my boat cloak, and took a circuitous route leading to the game-keeper's cottage, marvelling whether it was from witches, fairies, or beings of flesh and blood that I was to apprehend hostility. The night was stormy; sudden squalls swept over the face of heaven, and thick clouds frequently obscuring the light of the stars, it required all my knowledge of the topography of the place to guide me on my pilgrimage. I had not proceeded far, ere, notwithstanding the caution I adopted, I came unexpectedly upon Griffith, the bailiff, a fellow whom I had often encountered before in my midnight excursions, but whom I was not at all desirous to see at the present moment. I made a trifling observation respecting otters, and asked him what sport was a foot? He replied sulkily, that the place was so infested with vermin, a poor man could not rest in his bed. Remarking that the night was inclement, I said I should return home, and parted from him almost with the intention of fulfilling my words; but a feeling that I could not repress, prompted me to proceed, after I had made a circumambulation which I thought would baffle any attempt he might make to watch me. I was soon aware that other spirits were abroad; for as I approached the cliff, I heard a shrill whistle, which was immediately answered. Lying flat upon the grass, I crawled up the side of the hill, (a fashion I had learned in some of my adventures with the four-footed savages of India,) and on reaching the top, a faint light, which the opening clouds permitted for an instant, showed me a vessel lying close to the shore. My situation became every moment more critical, for Griffiths, who had tracked me with the scent of a bloodhound, hallooed to his companions, directing them to surround the cliff; and I heard myself denounced as a spy, and condemned to death, amid a volley of oaths and execrations. A little favoured by the increasing darkness, I disengaged myself from my cloak, and disposing it round the branch of a tree, which fortunately lay upon the ground beside me, I placed my hat upon the top, and planted it firmly in the earth, then cautiously gliding to the side of the hill, I dropped down amid the rocks, hoping to find concealment within their sheltering caverns; in another minute I heard the report of fire arms, followed by a discordant mixture of the laugh of vulgarity and the growl of disappointment. Again I felt myself to be closely pursued, voices shouted above, below, and on all sides; placing my back against the side of the cave, I drew out my pistols, determining to await the attack and sell my life dearly;

but what in my agitation I had not perceived to be a door, gave way to the pressure of my body, and I fell into a small apartment; instantly recovering my feet, ere I was aware that I had reached a place of safety, a young female darted forward, and closing the chasm in the wall, drew a heavy bolt across it. "Thank heaven that I omitted to fasten the entrance," she exclaimed, "since you have ventured out against my—but speak not," she continued, "your pursuers are at hand, and as I dare not refuse them admittance, I may yet have some difficulty in saving you."

She then led me to a nook behind a large chest, and carelessly arranging a few trunks upon the top, which formed a very effectual screen, she exhorted me to remain quiet until morning, when she hoped, she said, to favour my escape. I perceived that I was now a tenant of the upper story of the gamekeeper's house, for through a pretty wide fissure in the floor I saw Bartley seated in the lower apartment, drinking with two men: one of them habited as a sailor, whom he called "Captain," had the most villanous aspect I had ever beheld; and in the third, who formed the triumvirate, I recognised, by the shabby coat of professional black, and the cunning expression of his countenance, before I heard his name, the attorney, Dawson. I soon learned that these worthies carried on together the trade of smugglers, and not at all approving of my fondness for out of door amusements, had determined, the instant that the arrival of the vessel gave them the opportunity, to despatch me quietly out of the way; and it was for this reason that Dawson, taking advantage of my supineness, kept aloof, in the hope that falling by the hands of the desperadoes he was leagued with, he should still retain the management of the estate, and be enabled to carry on his nefarious trade without let or molestation. I did not feel myself in the most comfortable situation imaginable as I listened to the development of a plot of which I had been so nearly the victim, and felt that my own stupidity alone had prevented me from perceiving the sort of gentry I had to deal with. Towards morning, the smugglers had succeeded in landing their cargo, and accompanied by their captain they betook themselves to their vessel; Dawson departed at the same time, and Griffiths and Bartley, exceedingly drunk, and apparently fatigued with the exertions of the night, stretched themselves upon the floor before the fire and fell asleep. It

was then that my fair preserver made a sign for me to leave my retreat, and conducting me through various windings in the cavern, I once more breathed the air of heaven in safety. During our walk she informed me that Bartley was her step-father; that, reduced by habits of dissipation to extreme indigence, from a situation of respectability, he had broken the heart of her mother, and squandered the property of both; and that when he accepted the ostensible office of game-keeper from his friend Dawson, who had peopled the manor-house and the park with his creatures, though her birth and education rendered such a mode of life abhorrent and disgusting, yet destitute of friends and money, she dared not leave even his protection to seek a precarious subsistence among strangers. Shrinking with native modesty from my offers of service, it was long ere I could convince her that my intentions were honourable; and that, ignorant of the manners and customs of England, it was only through her advice and assistance that I could hope to obtain possession of my rights. She at length consented to settle a plan for our correspondence, and we parted.

The sun had just risen, and as I gazed upon the fair face of nature, so beautiful, and so calm, I could scarcely imagine that a scene of violence and murder had been upon the eve of perpetration, and that the inhabitants of this sweet solitude were only intent upon plunder and the preservation of their ill-gotten wealth. It is not necessary to enter into a prolix narrative of the methods by which I was put into legal possession of my paternal estate, and enabled to take either noon or midnight air upon my own manor without running the risk of having my throat cut. Messieurs Bartley, Dawson, and Griffiths, suspecting that it would not be altogether prudent to continue their illicit traffic upon my manor, or to invite their aquatic friends to feast in my hall, wisely took advantage of their colleague, the captain's vessel, to make their escape. The gamekeeper's lovely daughter refused to accompany them in their flight, and took up her residence in a neighbouring town. Though long estranged by circumstances from my fellow-creatures, my heart was feelingly alive to tender emotions, and I owed too many obligations to this interesting girl to suffer her to languish through her existence in servitude and dependence. It is now two years since we were united in marriage.

THE RADIATION OF HEAT.

When a hot body is suspended in the atmosphere, there are three ways by which it cools: first, by the conduction of the air; secondly, by convection; and, thirdly, by radiation. We trust that these terms are now sufficiently familiar to our readers to render further explanation of

them unnecessary. With regard to the first of these, we may remark, that as the conducting power of gaseous fluids is very limited, we cannot ascribe to it any great share of efficacy in the process of cooling. The agency of the second is more considerable, but that the effect

is not wholly attributable to the influence of the atmosphere acting in these two ways, is shown by the fact of a hot body cooling very rapidly when suspended in the exhausted receiver of an air-pump. In this last case, then, it can only be by radiation. This term is applied on the supposition that caloric passes equally, in all directions, from the surface of a heated body, in the same way that rays of light appear to proceed from a candle, or any other luminous point. Nor does the air seem to have any effect in retarding the radiation of heat, for we find that it goes on quite as freely in the atmosphere as in a vacuum.

M. Pictet performed some experiments in order to determine the velocity with which heat radiates, but he found that it passed through a very considerable distance in a space of time so small as to be inappreciable.

Experience has taught all of us that radiant heat is less intense the farther we are removed from its source. Every cold day affords us ample demonstration of this fact. It has been shown to bear a very simple mathematical ratio, which may, in illustration, be thus expressed:—That at two feet from a fire, four times less heat,—at three feet, nine times less heat,—at four feet, sixteen times less heat will be felt than at one foot.

The facility with which bodies radiate is influenced, in a curious manner, by the colour and nature of their surfaces. Various inquiries were pursued by Dr. Franklin, Sir H. Davy and others, for the purpose of ascertaining the influence that the colour of surfaces exerted on the process of radiation; and the conclusions they came to tend to show that dark colours radiate heat much faster than light ones. This, at first sight, would lead us to condemn the practice of wearing dark clothes in winter as unscientific; but we shall have occasion to allude to this subject again, when we speak of the absorption of heat.

Again, as to the effect of surfaces on radiation, the experiments of Mr. Leslie show, that smooth, bright surfaces, as of polished metals, are the most imperfect radiators; but that if they are rendered dull and rough, or are covered with a coating of lamp-black, resin, or other similar substances, their radiating power is very much increased. Hence we may conclude, that when we desire to retain the heat of any thing, a bright vessel is better than one of a different description; so that a metal tea-pot is superior to a black earthenware one.

We have hitherto spoken only of the manner in which bodies lose heat by radiation; it remains for us now to consider how this heat is distributed in falling upon other bodies. There

are three different ways in which it may be disposed of: First, it may be *reflected* from its surface, as the rays of the sun are reflected from a mirror; secondly, it may be *absorbed* into its substance, and thus give rise to an increase of temperature; or, thirdly, it may be *transmitted*, as a window transmits light.

The reflection of heat is as much affected by the colour and condition of the surfaces of bodies as we have seen radiation to be; but the investigations of the same philosopher (Mr. Leslie) indicate that these two powers are opposed to each other; for he has found that the best radiators are the worst reflectors, whilst substances which radiate imperfectly, have considerable reflecting properties. We read in history that Archimedes, the celebrated geometrician of Syracuse, set fire to an enemy's fleet by reflecting the sun's heat upon it. And Buffon has proved, by experiments on a very large scale, the perfect practicability of such a scheme.

Nor is the absorption of heat less influenced by the conditions which affect its radiation and reflection; for we learn from the same experimenter, that the state of surface which facilitates the former process, facilitates also absorption; whilst this, in its turn, is retarded by any circumstances favouring reflection. We might, indeed, have almost anticipated this latter fact; for as we know that opaque bodies cannot transmit heat, it is natural to suppose that all rays falling upon any surface, and not being absorbed, must be reflected, and *vice versa*. From what has been stated, then, it appears that the properties of radiation, reflection, and absorption, have an intimate relation to each other; that radiation and absorption bear a direct ratio to each other, but an inverse ratio to reflection. A knowledge of this fact would lead us to correct an opinion which we might previously have entertained,—that dark-coloured clothes are not advisable in winter; for we now perceive, that although they might radiate easily, they would absorb as freely. This will teach us, also, that water in a black kettle will boil sooner than in a bright one.

We have had occasion to notice above, that heat is transmitted without impediment through gaseous fluids: we find, also, that it is capable of passing through some transparent solids, but with much less facility. Thus, a thin stratum of water or glass will allow the transmission, in a slight degree, whilst a thicker stratum will intercept it altogether. When, however, combined with light, as in the solar rays, it passes readily. Hence we see the reason why a room in summer becomes so hot if the rays are allowed to enter at the window.

W. R. W.

APPEAL TO INFIDELS.

(From the French of Bossuet.)

THE principle which I lay down is as follows:—That of which we do not deign to think is as nothing to us. Those persons, therefore, say in their heart there is no God, who deem him to be unworthy of a serious thought. They are inattentive to his truth when it is preached, to his majesty when he is worshipped, to his justice when he strikes, to his bounty when he gives—who so treat him as a nullity, that, in fact, they imagine they have nothing to fear while he only is the witness of their conduct. Who among us is not of this number? Who is not stopped in his undertakings by meeting some one not in his secret nor of his party? And yet either we despise or forget the observation of God. We introduce not here the example of those who are revolving in their mind some theft or murder; for every thing they meet troubles them—the light of day, their own shadow, inspires them with dread; they can scarcely endure the horror of their melancholy secret; and yet they live in a supreme indifference to the observation of God.

But leaving these awful crimes, we will refer to what is to be seen every day. When you secretly tear in pieces those whom you publicly caress; when you pierce them with a hundred fatal wounds by the redoubled and incessant stabs of your dangerous tongue; when you artfully mix up truth and falsehood, to give probability to your malignant narratives; when you violate the sacred deposit of secrecy which a too simple-hearted friend has poured forth unreservedly into your bosom, and you use for your own interests the confidence which required you to think only of his; how much care do you take that it should not become apparent! How you look to the right and the left! and if you perceive no witness to reproach your mean cowardice, if you have spread your snares with such subtlety that they may be imperceptible to men, you say, "Who sees us?" As the psalmist remarks, (Psalm lxxiii. 5.) you reckon not among the observers of your conduct Him who dwells in the heavens. And yet listen to the same psalmist: "He that formed the ear, shall he not hear? and he that created the eyes, shall he not see?" (Psalm xciii. 9.) How is it you do not surmise that he is all sight, all intelligence; that your thoughts speak to him, that your heart discloses every thing to him, that your own conscience is his watchman and his witness against yourself? And yet under those eyes so lively, under those observations so piercing, you rejoice without apprehension, in the pleasure of being concealed; you abandon yourselves to joy, and live in repose among your criminal delights, without even dreaming that he who forbids them,

and who has left you so many that are innocent, will one day come unexpectedly, in a terrible manner, to disturb your pleasures, by the severities of his judgment, when you least apprehend it. Is not this manifestly to reckon him as nothing—to say in your heart, "There is no God."

When I search into the hidden causes of a forgetfulness so monstrous, and consider within myself whence it is that a man so sensible of his own interests, and so attentive to his own affairs, nevertheless so easily loses sight of that very thing which is the most essential, the most dreadful, the most present,—that is to say, God and his justice,—this thought occurs to me:—I find the soul is bounded by such narrow limits, that it has not a comprehension sufficiently vast to reach beyond its enclosure, and therefore can only form a lively conception of that which it perceives in itself, and leads us to judge of the things which surround us, by our own disposition. The angry man imagines that all the world is agitated by the injury which he only feels, while he fatigues every ear with the recital of it. The indolent man, who negligently leaves every thing to its own course, never conceives of the activity of those who are attacking his property; while he reposes and sleeps at his ease, he supposes all sleep with him, and is only awakened by a blow. It is a similar illusion, though much more universal, which persuades all sinners that, while they languish in sloth, in pleasure, and in impenitence, Divine justice languishes also, and is altogether lulled asleep. Because they have forgotten God, they think that God also has forgotten them: "He hath said in his heart, God has forgotten it." (Psalm ix. 34.) But how extreme is their error! for if God is sometimes silent, he will not be always silent. "Behold," says he, "I will watch over them for evil, and not for good." (Jer. xlv. 27.) And elsewhere,—"I have long time holden my peace, I have been still and refrained myself; now will I cry like a travelling woman, I will destroy and devour at once." (Isaiah xlii. 14.) Do not, then, Christians, take his silence for approbation, nor his patience for pardon, nor his long dissembling for forgetfulness, nor his goodness for weakness. He waits because he is merciful; and if his mercy be despised often, he still waits, and hastens not his vengeance, for he knows that his power is irresistible. As a king who knows that his throne is established, and his power confirmed, ascertains that secret purposes of revolt are conspiring against his service,—for it is difficult to deceive a king who is wakeful and vigilant,—and is able to stifle in the birth the discovered plot, but, conscious of his power, is willing to see how far the rash conspiracies of his unfaithful subjects

will proceed, and therefore hastens not his righteous vengeance till they shall have attained the fatal limit where he has resolved to stop them;—so, and for a stronger reason, the almighty God who, from the centre of his eternity, unfolds the whole order of ages, and who, as the wise disposer of time, has arranged the destiny of every moment before the origin of things,—hastens nothing. Those only are in haste and precipitation whose counsels are governed by the rapidity of events, and are carried away by success. It is not thus with the Almighty. Sinners are under his eye, and in his grasp. He knows the time he has given them for repentance, and that in which he waits to confound them. They may mingle heaven and earth to hide themselves, if possible, in the universal confusion: faithless women, and corrupt and corrupting men, may cover themselves, if they can, with all the shades of night; those who are so skilful in conspiring for their destruction, may wrap up their lewd conceptions in the obscurity of an impenetrable intrigue: they shall be detected at the day of decision; their cause shall be carried before the tribunal of Jesus Christ, where their conviction cannot be eluded by excuse, nor their punishment retarded by lamentation.

But I have yet to unfold profounder truths. I do not merely intend to inspire sinners with apprehensions of the severities of the last judgment, and the intolerable punishments of the world to come, lest the peace in which they indulge in the present life should only cherish in their heart a blind and impenitent hope of impunity. The Holy Spirit teaches us that their peace is itself a punishment. Sinners, attend! There is a new mode of vengeance, which belongs to God alone,—it is that of abandoning his enemies to their repose, and of punishing them more effectually by their own obduracy and lethargic slumber, than though he inflicted some exemplary chastisement. In fact, therefore, Christians, it frequently happens that, from the very vehemence of his displeasure, God shuts up all his anger within his own breast, in such a manner that sinners, being themselves astonished at their prolonged prosperity, and the fortunate course of their affairs, imagine that they have nothing to fear, and have no more any trouble of conscience. Such is that fatal drowsiness, that deathful slumber of which I have spoken. It is, my brethren, the last plague that God sends to his enemies, it is the height of all calamities, it is the nearest approach to final impenitence, to ultimate and irretrievable ruin.

To understand this it should be remarked, as the excellent maxim of holy divines, that “by so much as sinners are severe censors of their own vices, by so much God relaxes, on their behalf, the severity of his judgments.”* As it is written,

that God loves righteousness and abhors iniquity, so there is something within us which cries out against sin, and rises up against vice—something that takes part with God; and this is a disposition favourable to his reconciliation to us. But from the time that we are so unhappy as to be altogether in accordance with our sins, from the moment that, by the basest of crimes, we come to the point of abolishing in our heart the sacred truth of God, the impress of his finger and his light—the stamp of his sovereign justice—by overthrowing the solemn tribunal of conscience, which condemns every crime—the empire of God is destroyed, the audacity of rebellion is consummated, and our misery is all but remediless.

Hence the great and living God, who knows that supreme happiness consists in serving and pleasing him, and that what remains for the improvement of those who are distant from him by their crimes, is to be grieved and distressed at the calamity of having displeased him; after having long despised his favours, his counsels, his merciful warnings, and the strokes of his hand, which have been given from time to time, not yet to punish with the utmost severity, but only to awaken us,—comes at last the final resolution to take vengeance on ungrateful and insensible men; withdraws his holy illuminations, blinds and hardens them, and, abandoning them to a forgetfulness of his Divine commands, they are at the same time made to forget both their salvation and themselves.

And that this doctrine may appear fully fixed in the order of the judgments of God, I shall consider nothing accomplished if it be not clearly proved. I must therefore point out from Scripture the progress of this mighty evil. The prophet Isaiah represents himself as holding a cup in his hand, which he calls the cup of the Lord's fury:—“which hast drunk at the hand of the Lord the cup of his fury.” (Isaiah li. 17.) And he declares it to be filled with a draught which he will have sinners to drink—a draught foaming up like new wine to the head, and inebriating them. This draught, which intoxicates sinners, what is it else, than their sins themselves, and the maddening desires to which God abandons them? They drink as a first glass, and by little and little the head turns giddy, that is to say, in the ardour of their passions, reflection, half extinguished, emits only a dubious light, so that the soul is no longer enlightened as before; the truths of religion, and the awful judgments of God are no longer seen, but as through a thick cloud. This is what is termed in Scripture, the spirit of error, which renders men wavering and unstable. Nevertheless, they still deplore their weakness, and cast some glances towards the virtue which they have forsaken; their conscience wakes from time to time, and says, with a secret sigh, “O, mercy! O, chastity!

* Tertul. de Pœnit., n. 10.

O, innocence ! O the sanctity of baptism ! O the purity of Christianity !” Sense overpowers conscience ; they repeat the draught, till their strength diminishes and their sight grows dim : and yet some knowledge, some remembrance of God remains. Drink, drink, ye sinners, drink to the very last drop, swallow all to the very dregs. But what will they discover there ? “Thou hast drunken to the dregs of the cup of trembling, and wrung them out.” And observe the strange effect ;—“Thy sons have fainted, they lie at the bend of all the streets, as a wild bull in a net.” It is a representation of great sinners who, having been for a long time intoxicated with the wine of their passions and their criminal indulgences, at length lose all knowledge of God, and every sense of their guilt. They sin without hesitation ; they remember it without sorrow ; they confess it without compunction ;

they persevere in it without uneasiness ; they die in it without repentance.

Open, then, your eyes, O sinners, and consider your state. While gratifying your evil desires, you drink a long forgetfulness of God ; a mortal slumber gains upon you, your understanding is obscured, your senses are enfeebled. Yet, as the apostle declares in Romans ii. 5, “Thou treasurest up unto thyself wrath against the day of wrath.” His fury, long restrained, will suddenly burst with terrific majesty ; then you will be aroused by an awful blow, but aroused only to feel your intolerable punishment. Prevent so great a calamity. Awake ! the hour is come. “Now is it high time to awake out of sleep.” Awake, and hear the warning, lest you awake only to hear your sentence. Delay no longer ; this very hour in which I am speaking should, if you are wise, be the hour of your awakening. X.

DEMAND FOR POETRY.

(From Grund's “Americans.”)

If the Americans are not all poets, they at least read poetry with an avidity which borders on gluttony. Poetry is the necessary condiment of an American newspaper. The first page of it is always adorned by a poem, and there are some which are even graced with half a dozen. Supposing only two thousand daily papers to be published in the United States, (which is but a small average, exclusive of semi-weekly and weekly publications,) and their annual number will amount to 730,000. Allowing but one out of a thousand to be good, and you will have 730 good poems in the course of a year, which will make two volumes 12mo., and, consequently, more than is published in a twelvemonth in any other part of the world. I wonder no American bookseller has ever thought of collecting these fugitive poems, which would certainly present a greater variety of entertainment than any one single volume. But the want of enterprise in the venders of books is supplied by the kindness of youths, who are in the habit of composing volumes by pasting the best “daily poems” to the blank leaves of their albums ; satisfying, in this manner, the cravings of their tastes, by paying a just tribute to the merits of the author. Let no one smile at the simplicity of this description. Children are sometimes better judges of poetry than adults ; and, if they do not always understand what they are reading, their feelings are often better guides than the nicest distinctions of critics. Besides, who of all that read poetry pretend to understand it ? Is poetry not often

found the more beautiful the more it is unintelligible ? Let any one read Lord Leveson Gower's translation of Goethe's “Faust,” or some of Coleridge's translations of Schiller, and he will at once be satisfied of the truth of my assertion. Is the author himself obliged to comprehend the sense of it ? Would this not be crushing genius in the cradle ? As long as these questions are not satisfactorily answered, I am for the pasting system of America, as being at once an easy, cheap, and comprehensive method of transmitting the fame of our contemporaries to the latest posterity. Poetry is produced and consumed in America in most enormous quantities. Besides the publications in the newspapers, to which I have already alluded, there hardly passes a day without ushering a new volume into existence, which is greedily read, admired, censured ; but, at any rate, sold. There are, certainly, more poets among the Americans than prose writers, owing to a kind of musical impulse, which makes them express themselves in rhymes. But, above all, it is the prevailing taste of the readers which calls for this extraordinary exertion on the part of the authors, as the manufactory of goods must increase with the consumption. The Americans, as a nation, are the most reading people on the face of the earth. I can safely assert, that there are annually more volumes read in the United States of America than either in England, France, or Germany ; but the favourite works are poetry and, next to them, novels.

MEDICAL THEORIES.

FIRST ARTICLE.

AMONGST the variously constituted minds which fluctuate and flow amid that mass of human beings, denominated “the world,” the subject of medical theories may perhaps, in the

present days of the universal diffusion of knowledge and information, partake somewhat of the nature and quality of a standing jest, save where amongst the *illuminati* of some Medical Diffusion Society, it lifts up its head in its pride and loftiness of position and place, and proclaims itself by creation and birthright superior to its antagonising brother, "Practice." And amongst its supporters and confederates we may find, after busy search, many who aspire to knowledge, and prudence, and all wisdom—with whom, however, the privacy and penetration of the closet hold a higher degree of respect and favour than do the sad and sickening details of disease, which echo from the cold and the pallid lips of the suffering and the dying. Among such as these, the chief employment and occupation is to bandy about words without either signification or idea, through nights, and weeks, and months, and years of time, and to pass their entire lives (or at least its chief and principal portion) in studying and discussing what is theory and what is not theory, instead of turning their attention to, and employing their minds in acquiring that careful and minute insight into the destructive regions of disease, which will, sooner or later, prove, most certainly, both desirable and useful in practice. Our thoughts and sentiments on this subject will, we doubt not, appear most scandalously and shamefully heretical to these followers and disciples of Galen and Sangrado; but, alas! we number the greatest amount of our days amongst the things that have been, and we may be likewise too late sensible of the truth and verity of that important maxim, which proclaims, *vita brevis ars longa*.

Lord Bacon, in one of his beautiful essays of wisdom, reckons it as a matter and subject worthy of surprise, that there should be more voyages than travels published, and that of those lands and countries where there is very little or nothing to be seen, there should be so much more written. Now, with all our high respect and admiration for the genius and talents of the great Verulam, we must state our conviction that the above remark may be, without falsity, admitted to be a very foolish one for a great lawyer to make, inasmuch as his legal knowledge and information ought ever to have taught him that the emptiest causes ever supply the longest pleadings—it would be quite correct to give the same estimate of such a remark if made by Lord Bacon in his character of a great logician and metaphysician, who by the very rules whose study strengthens and finishes such a character as this latter one, must be aware that the biggest books contain the fewest ideas; and that same observation obtains less notice and respect as made by Lord Bacon, who himself lent some heavy blows to that entire system which supposed the existence of a *vacuum*, and whose single, unaided, and unassisted efforts did more

to quell that hydra than those of any other man who lived before or who has existed since.

Premising our apologies for this Baconian digression we resume the consideration of our subject. Though in this day of our grey old age our studies and our devoted attentions to the subject of Medical Theories are fortunately long since terminated, yet even now the very sight of a medical library, with its old oaken carvings, and its shelves loaded with its numerous boarded, black letter, folios and quartos, the written treasures of ignorance, magic, and savage witchcraft, strikes us with an awful and indescribable horror—similar to that we should suffer from the crazy apparition of Banquo's ghost—our readers may smile at our superstitious weakness and folly, but as true as that our Miscellany has risen in circulation 10,000 every week since the first day of its publication, so truly does the appearance of either Cuthell's or Cullen's catalogues of medical books cause within us slight febrile exacerbations, attended by gentle rigors, nausea, and pains in the hypochondriac region; the exact geographical situation and position of which on the surface of the human frame we remember well, being sorely puzzled to discover in our earlier days, when we were taught to consider that dissection was the very acme of the art and mystery of carving.

We do not believe that the parchments and papyri of the Alexandrian library heated all the baths of that great and luxurious city for three months; but by all the truths and verities which we are now administering in the most palatable shape to our readers, we are very ready to bestow our conscience and affirmation on the belief that all the medical books which have ever been written in Great Britain, from the earliest days of the Caxton press down to the present time, would most certainly keep all the baths in the United Kingdom at the boiling point for a twelvemonth or more; and indeed we are quite sure that nine-tenths of them could not be employed for a better purpose. We occasionally (when not beset by that black spirit, the printers' devil, for "copy") drop in to cast our grey eyes over the earlier scenes of our surgical attendance and practice, in the wards of our great London hospitals. In our days there was no "library" or reading-room there; but, alas! a change has come over them as over us, and on the now heavily laden and groaning shelves, we perceived, a few days since, that the manager, who we verily believe is more fit to be kept in a lunatic asylum than in a library, had placed on the same row, and in closest approximation, "Wadd's Commentaries on Croup and Coryza" and "Fox's Book of Martyrs." Often, since the day on which we made this detestable discovery, have we passed this haunted shelf, and as often have we sighed in spirit, "Oh for an Omar, and no deputy-lieutenant to control his pious intentions!"

Our non-medical readers may perhaps by this time have discovered that we form a unit* among the countless, starving hundreds who, in this vast metropolis, have piously pledged themselves to pills and purgatives, and may therefore be ready to consider that we are speaking unjustly of, and dealing hardly by, a profession to which (if we do not starve by the way) we may be one day indebted both for fame and fortune. But they will perhaps suspend their judgment for a while, or even go so far, when the gently melting mood is on them, as to commiserate the utter hardness, injustice, and severity of our lot—the lot of us, the elder Galens of the day; when they are told that besides feeling pulses all day, administering jalap—acting the part of Paracelsus all day and Lucina all night; driving, riding, walking; bleeding, toothdrawing, vaccinating, blistering, and a thousand other things besides, we must all be doomed at one fatal period or other of our lives to write a book, and what is worse still, we have to read for a book. We have now before us a long list of worm-eaten and moth-destroyed tomes, which were read once by a departed friend of ours, whose predestined period of life at which he was to write a book had arrived exactly on the very day that Buchan the domestic medicine-monger gave up the ghost and medicine too at the same period of time. We learn from a record in his *Miscellany*, (*Miscellanies* were in vogue even in those pious ancestral days of our forefathers, gentle reader,) that when he had shed the last tear over the grave of Buchan he returned home and forgot his sorrows and griefs for the lamented dead in reading for his projected work. It will not be necessary for us to enumerate the titles of the books, we will content ourselves with specifying their number and the subjects they dealt in. They included two hundred and forty treatises on the plague, as many on scarlet fever, and as many on small-pox; four hundred on fevers, twenty on chilblains, six complete and finished treatises on corns, fifty on the gout, two hundred on rheumatism, five thousand on inflammation of various kinds; besides systems of physic, systems of midwifery, systems of anatomy, systems of surgery, nosologies without end, and treatises in folio, quarto, octavo, and

duodecimo, on more evils than ever were contained in Pandora's box, without remorse or mitigation of bulk, and number, and emptiness; to say nothing of botany, and chemistry, and drug-medicine, and pharmacy, and of ten or twenty dissertations on the itch. He was not writing for a degree, a wife, a doctorate in Madagascar, or a professorship in Kamschatka or the moon, but simply and solely for a book. And what was the end of all this toil? A lancet, a blister, calomel and salts.

But, alas for my reading friend!—he is dead now, and the truth may be spoken—in spite of all the hundred thousand volumes of all ages, shapes, sizes and types, over which he pored and pondered, men, and women, and children have gone on dying pretty nearly at the same rate since his death, as they did before, and will we suppose do the same until death shall have no more dominion over us. This very abnormal hatred, which we have ever felt towards medical books, has induced us seriously to consider the propriety of extending our patronising propensities towards those paragons of medical utilitarianism—the quacks—a race of created beings who hold out to you neither illusion nor deception, neither treachery or fraud; their open-hearted singleness of character, their strength of truth, and firmness of belief in the doctrines they support, encourage, and espouse, affords us a noble example, worthy of being followed in all climes and ages of the world, in all states and existences of society. They save our lives and our time too. “Here are the pills,” say they, “that will cure all your diseases—here is the koran, you may burn your books.” Can we be too thankful? They are sent upon earth to preserve and prolong our lives, and in return for their kind assistance and affectionate advice, we spurn them from our doors, we prosecute and imprison them, we show them up in the newspapers and police offices, and the man who by foul swearing causes one of these gentle creatures to cross the waters in a convict pleasure boat for life, is considered as a canonised saint for the remainder of his mortal existence. Verily quacks are a race of people hardly dealt with; they are truly amongst the rejected and the outcasts of society.

THE CROCODILE.

A FABLE.

(From the German of Krummacker.)

In ancient times, a multitude of people wandered from their habitations, and came to the country through which the river Nile directs its course. They rejoiced over the beautiful stream and its lovely water, and erected dwellings on the shore.

* We must utterly disclaim all contemporaneous creation with Irishmen.

But in a short time that dreadful monster, the crocodile, came out of the river, and wounded man and beast.

Then the people prayed to their god Osiris, and begged him to deliver them from this enemy. But Osiris answered by the mouth of his wise priest, and said, “Is it not enough that the

divinity has given you strength and understanding? Whoever asks for aid when he can help himself, supplicates in vain.

Now they took up swords and clubs, and attacked the enemy in his grassy retreat. They erected dams and places of defence, and in a few days accomplished a work of which they thought themselves incapable. Thus they became conscious of a strength which, in a subsequent age, laid the foundations of lofty columns and noble pyramids; and they discovered many arts and instruments which were previously unknown to them.

For a struggle with the mighty awakens and improves the slumbering strength of man.

But yet the inhabitants of the Nile were in want of instruments to complete their triumph over their mailed enemy, as long as they remained in the river. They could drive them back in a short time, whenever they were bold enough to approach the land, and with this they were satisfied.

By degrees, however, they lost their zeal for resistance. The animals became larger, and increased in number. Their rage was fearful. Then this foolish and slumbering people resolved to worship the crocodile as a god.

They brought him, voluntarily, rich offerings, and the enemy became more powerful than ever; but the people sunk into stupid inactivity.

For slavery and mental bondage makes man base and cowardly.

At length the overstrained bow breaks asunder, and vengeance reaches the tyrant. Osiris interfered, and summoned them, by the mouth of the wise priest, to a new contest. The struggle began, and the river was red with the blood of the slain.

Already the combatants began to be weary, when the priest and the afflicted people cried to Osiris for aid, and the divinity listened to the supplication. A small animal called the Ichneumon stood on the shore of the Nile. "Behold!" cried the priest, "here is help from Osiris." "How! do you mock us?" exclaimed the whole multitude of the people.

Then the priest answered and said, "Wait for the event, and trust in a higher power. He can end the greatest troubles by the simplest means."

The number of the enemy soon began to diminish. The people regarded the small animal with wonder. In silent activity it sought the eggs and the brood of the crocodile. It destroyed, in a moment, hundreds before they were hatched, and delivered the land of its plague; a deliverance which so many heads and hands could not accomplish.

"Behold!" said the wise priest, "if you wish to annihilate an evil, begin at the bud and the root; then the smallest means will effect that which, at a later period, man cannot accomplish."

INFANCY AND CHILDHOOD.

I do not wonder that poets and moralists have gazed, with intense interest, and with unutterable emotions, upon infancy and childhood. The young human creature just ushered into life is an object of unspeakable interest. What a prospect is before it!—What undeveloped faculties does it possess!—What a part it may yet act upon the theatre of the world!—What a sea of sorrow and calamity it may have to pass through!—What infinite glories may encircle it on the eternal mount of God!—What unspeakable sorrows may gather around it in the dark pit of endless despair!

Can we look upon this young creature just bursting into life, just starting into immortal existence, itself unconscious of its mysterious powers, and we totally ignorant of its final destiny, without deep and solemn interest! All that we know with certainty in relation to it is—that trouble and death are before it! And yet, upon the forefront of these evils, mercy is written with a fair and plain hand. For trouble, under the sanctifying influence of the Holy Spirit, brings us back from our wanderings to God; and death, though its hand be rough and icy, opens the door that admits us into the pure

mansions of celestial blessedness. Hence there is no less truth than poetry in the exclamation of Mrs. Hemans,—

"Gaze on—'tis lovely childhood's lip and cheek
Mantling beneath its earnest brow of thought;
Gaze—yet what seest thou in those fair, and meek,
And fragile things, as but for sunshine wrought?
Thou seest what grief must nurture for the sky,
What death must fashion for eternity."

In one point of view, childhood is a most interesting season. It is the spring-time of life—the season when flowers bloom, when the air is balm, and all nature full of sights and sounds of loveliness. No parent can contemplate this period of life—can think what it was to him, and what it now is to his offspring—to those young beings whose joyous looks and thoughtless prattle often cheer his heart, without deep and unutterable emotions. For he cannot but remember that the frosts of autumn, and the rough winds of winter, will soon wither those vernal beauties, and spread bleak desolation over all this fairy scene! It is then that a parent learns to estimate aright the privilege of a throne of grace, to which he can go, and seek heavenly guidance and almighty protection for his beloved

offspring. Yea, and as he bows before the mercy-seat, and thinks of his own mortality—thinks what will become of his dear children when his head is laid low in the dust, he cannot but thank the Lord for that voice of encouragement which comes to him saying, "Leave thy fatherless children, I will preserve them alive; and let thy widows trust in me." How does man's mortality endear a mercy-seat to him, and draw his affections up to a covenant-keeping God!

I presume that every one has felt that if he could go back to childhood, and have the ordering of the influences that, from the first, were brought to bear upon his mind, he would be able to start in life at a much higher point of excellence, and have the prospect of accomplishing a far greater amount of good. This, however, we cannot do. To the hands of parents are committed the work, and the momentous responsibility, of moulding the character of all who successively appear on the stage of human life. It is, therefore, of no slight importance to trace the operations of mind in childhood, and to mark the effect of influences brought to bear upon it at that period. It is these influences that will mould, and fashion, and shape the intellectual

and moral image that will be fully developed in manhood. The features of that image, which will one day stand forth in distinct and visible lines, may, to a great extent, be known from the character of the moral influences brought to bear upon the young mind. "Train up a child in the way he should go, and, when he is old, he will not depart from it." If those influences are holy and heavenly, faith, with her microscopic glass, will enable us to discover the embryo of the future flower, and apply to a moral intelligence what was said of a certain form of vegetable existence.

"Here lies a bulb, the child of earth,
Buried alive beneath the clod;

* * * *

'Tis said that microscopic power
Might through its swaddling folds descry
The infant image of the flower,
Too exquisite to meet the eye.
This vernal suns and rains will swell,
Till from its dark abode it peep—

* * * *

Two shapely leaves will first unfold;
Then, on a smooth, elastic stem
The verdant bud shall turn to gold,
And open in a diadem."

LADY HESTER STANHOPE.

CHAPTER II.

According to her general style of living, Lady Stanhope could not be seen before the hours of three or four in the afternoon. We were each conducted into a narrow species of cell—dark and unfurnished. Breakfast was served up to us; and throwing ourselves upon the divan, we awaited the summons of the invisible hostess of this romantic dwelling. I slept until three, when I was informed that her ladyship awaited me. I traversed a courtyard, a garden, a kiosk hung with jasmine flowers, then two or three sombre corridors, and I was then introduced by a little negro child into the cabinet of Lady Hester. It was filled with so dark an obscurity that I could scarcely distinguish the serene, noble, softened, and majestic features of the white figure that, robed in the oriental costume, arose from the divan, and advanced towards me with extended hand. Lady Hester appeared about the age of fifty, and she had those traces that years cannot alter; freshness, colour and grace depart with youth, but when beauty is in the form, and in the linear traces of the countenance, and in the dignity, majesty, and thoughtful physiognomy of man or woman, beauty changes with the different epochs of life, but does not pass away. Such was the beauty of Lady Stanhope. On her head she wore a white turban, having in the front a fillet of purple linen, falling down on each side to the shoulders; a long yellow cachmeer shawl, a large Turkish robe of white silk, with floating

sleeves, enveloped her in its simple and majestic folds; and through an opening in the white dress, over her bosom, was a second robe, of Persian stuff, worked with rich flowers, which was fastened around her neck by a clasp of pearls. Yellow Turkish-Morocco boots, fringed with silk, completed this beautiful oriental costume, which she wore with the freedom and grace of one who has worn none other since her youth.

"You have indeed come from a great distance to see a hermit," said Lady Hester, "be welcomed. I receive but few strangers, scarcely one or two in a year, but your letter gratified me, and I was anxious to know more of one who, like myself, loved God, nature, and solitude. Besides, something tells me that our stars were friendly, and that we shall mutually agree. I see with pleasure that my prophecy has not deceived me, and your features, that I now see, and the simple sound of your step as you traversed the corridor, have given me sufficient intelligence of you not to repent having desired to see you. Be seated, and let us converse; we are already friends."

"How, Lady," said I, "can you so soon honour with the name of a friend one whose life and name are totally unknown to you? You know not who I am."

"That is true," she replied, "I know not what you are according to the world, nor what you have done since you have lived among mankind, but I already know what you are before God."

Do not take me for insane, as the world often does, but I cannot resist the wish of speaking to you with open heart. There is a science which is now lost to Europe, it was born in the east and has never perished, it liveth there still. I possess it. I read the stars. We are all children of some of those celestial fires, which presided at our birth, the happy or malignant influence of which is written in our eyes, on our foreheads, in our features, in the lines on the hand, in the shape of the foot, in our gestures, and in our aspects. I have only seen you for a few minutes, and I already know you, as though I had lived with you for an age. Do you wish that I should reveal it to you, that I should prophesy to you your destiny?"

"Be careful, Lady," I answered, with a sigh; "I do not deny that of which I am ignorant. I will not affirm that in the realms of visible and invisible nature, beings of an inferior order, like man, are not under the influence of superior intelligences, such as stars or angels are, but I want not their revelations to know myself, corrupt, infirm, and miserable as I am. And as to the secrets of my future destiny, I should profane that Divinity who hides them from me, were I to demand them of a creature. As regards the future, I believe but in God, in liberty, and in virtue."

"I do not care," she answered, "believe what you will: as to myself, I evidently see that you are born under the influence of these happy stars powerful and good, who have gifted you with analogous qualities, and who will conduct you to an end, that I could indicate to you, from this day, if you would wish it. It is God who has led you here to enlighten your soul; you are one of those men of ardour and good-will, whom he receives as instruments for the wonderful works that he will shortly accomplish among mankind. Do you believe that the reign of the Messiah has arrived?"

"I answer you," I replied, "by stating that I am born a Christian."

"Christian," she answered, with a gentle smile, "I also am a Christian, but he whom you call the Christ, has he not said, 'I speak to you again by parables, but he who cometh after me will speak to you in spirit and in truth.' Well, that is what we now wait for. He is the Messiah who is not yet come, but who is not far off, whom we shall see with our eyes, and for whose coming every thing in this world is being prepared! How will you answer this? and how can you deny or retract the very words of the Evangelist that I have recited to you? what are your reasons for believing in Christ?"

"Permit me, Lady," I answered, "to decline entering into this discussion with you, I do not even enter into it with myself. There are two lights for man, one which enlightens the spirit, which is subject to discussion and doubt, and

which frequently leads to aberration and error, the other, which enlightens the heart, and never deceives, for it is at once evidence and conviction, and for us mortals truth is nothing but conviction. God alone possesses truth as truth, we only possess it as faith. I believe in Christ because he brought down upon earth the most sainted doctrine, the most fruitful and Divine that has ever yet been reflected upon human intellect. A doctrine so holy could not be the result of deception or falsehood. The doctrines of Christ are known by their morality as the tree is known by its fruits—the fruits of Christianity. I speak of those fruits that are to ripen in the future ages, more than of those that have been already gathered, and are become corrupted—fruit infinite, perfect, and Divine,—the doctrine of which is Divine, the author of which is a Divine Word, as he has thus called himself. Such are the reasons why I am a Christian; such is the religious controversy which I hold with myself; with others I hold none: you can only prove to man that which he already believes."

"But," replied she, "do you find the social, political, and religious world, well ordained? and do you not feel that which all the world feels,—the want, the necessity of a Revealer, of a Redeemer, of that Messiah that we look for, and that we already behold in our hopes?"

"As regards that," I replied, "it is another question. None suffer more than myself, or groan from the universal wailing of nature, of mankind, and of society; none confess more deeply to the enormous abuses of social, political, and religious systems; no one desires or hopes more from the benefit of a reparation of these intolerable evils of humanity; no one is more fully convinced that the Repairer of all these can be none other than a Divine Being. If you consider this as the awaiting of a Messiah, I await for it as you do; and, more than you, I pant for its near appearance; like you, yet even more than you, I perceive in the shaken creeds of mankind, in the tumult of his ideas, in the void in his heart, in the depravity of his social state, in the repeated shaking of his political institutions, all the symptoms of an overthrow, or of a near and imminent revival. I believe that the Almighty shows himself always at the precise moment where all that is human is insufficient, where man confesses that he can do nought for himself. I believe, therefore, in a Messiah, who shall appear in the times of our own epoch; but in that Messiah I do not see the Christ, who has nought more to give us in lessons of wisdom, of virtue, and of truth; but I see him whom Christ has announced would come after him.—That Holy Spirit is always stirring up and assisting man, always revealing unto him, according to his time and his wants, that which he ought to do and to know. That this Divine Spirit is incar-

nate in man or in doctrine, in fact or in idea, signifies little, it is ever Him, be it man or doctrine, circumstance, or thought; I believe in him, I hope in him, I wait for him, and, more than you, lady, I invoke him. You perceive, therefore, that we can understand one another, and that our stars are not relatively so divergent as this conversation might at first have led you to believe."

She sighed; her eyes, sometimes veiled by alight tears as I confessed to her my Christianity, became enlightened with a tenderness of regard, and a lightness that was almost supernatural.

"Believe what you will," said she, "you are not the less one of those men for whom I have watched, whom Providence has sent to me, and who have a great portion to accomplish in the work which is being prepared. You will soon return to Europe. Europe is finished: France alone has a great mission to accomplish. You will participate in it; I know not yet in what manner; but I can tell you of it this evening, if you should wish it, when I have consulted your stars. I know not yet the name of them all; I see at present more than three—I distinguish four—perhaps five—and, who knoweth? perhaps many more. One of them is certainly Mercury, who giveth brilliancy and colour to the intellect and the word. You must become a poet; it may be read in your eyes, and in the superior portion of your figure. Lower than this, you are under the influence of stars totally different, and almost opposed. There is an influence both of energy and of action. There is of the sunbeam, also," said she, suddenly, "in the position of your head, and in the manner in which you droop it over your left shoulder. Be thankful to God; there are few men who are born under more than one star; few whose star is happy; fewer still whose star, however favourable, is not counterbalanced by the malignant influence of an opposing one.

You, on the contrary, have many, and all harmoniously arranged for your service, and all of them interaiding each other in your favour. What is your name?" I told her. "I had never heard it before," replied she, with the accents of truth.

"Such, lady, is glory! I have composed some verses, in my lifetime, which have caused my name to be repeated a million times, by all the literary echoes of Europe; but that echo has been too weak and feeble to traverse the surface of your seas, and the heights of your mountains; and here I am as a new being, a man completely unknown, a name never heard. I cannot but feel flattered by the kindly favour which you have shown me; I only owe it to you and to myself."

"Yes," said she, "poet or not, I love you, and I hope in you; but be assured that we shall see each other again. You will return unto the West; but you will retard not your return unto the East, it is your country."

"It is, at least," I answered, "the land of my thought and my imagination."

"Do not smile," she replied, "it is your country, the land of your fathers; I am quite assured of it now: look at your foot."

"I see nothing," said I, "but the dust of your paths which covers it, and of which I should be ashamed in a European saloon."

"That is nothing," replied she, "look again at your foot; I had not even myself carefully regarded it. See, the instep is elevated; there is, between the heel and the toes, when your foot is on the ground, a space sufficient for water to course under, without overflowing it. It is the foot of the Arab, the foot of the East; you are a son of these climates, and we are approaching that day when every one shall enter into the territory of his fathers.—We shall meet again."

STANZAS ON AN OLD NEWSPAPER.

ONE morn, about a hundred years ago,
This chronicle was usher'd into life,
Record of human happiness and woe,
Of foreign fury, and of civil strife.

Just issued from the teeming press, perchance
On the peer's breakfast-board the clean sheet lay,
While with a listless and a lordly glance,
He scan'd the stirring topics of the day.

Or on some summer's eve, it might have been,
When pure and cooling breezes were abroad,
The country squire, with most sagacious mien,
A careful glance upon the page bestow'd.

Or here with throbbing heart, and weeping eye,
The maid might read her warrior lover's doom;
This the sad cause of many a burning sigh
That scap'd her in her dimly lighted room.

Weddings, and bankruptcies, and want, and woe,
These form a leaf of thy great volume, Time!
And here the inward grief, that "passeth show,"
The mourner's grief, perchance demands a line.

The mourner's grief! he is no mourner now;
The prisoner's pang! a touch hath set him free;
Both he who ruled, and those once wont to bow—
He bears no sway—thy no more bend the knee.

Go! read a homily to living men,
Those of a former age were great as they;
Warriors were valiant, princes powerful then,
Time's gorgon hath transform'd them into clay.

Bear them a solemn message from the skies,
Tell them thy page hath surviv'd learning's breath;
Teach them that wisdom's essence only lies
In making life an antidote for death. K.W.M.

MEN AND THINGS.

ROGER WILLIAMS.—This celebrated individual is well known as the founder of the State of Providence, Rhode Island, the first government which ever allowed full civil and religious liberty. In August, 1836, the Rhode Island Historical Society resolved on a festival in celebration of the completion of two centuries from the establishment of the state. The following is an extract of a letter addressed to the meeting, by Dr. W. E. Channing, of Boston, who was prevented from attending the festival :—

"Other communities have taken pride in tracing their origin to heroes and conquerors. I boast more of Roger Williams, the founder of my native state. The triumph which he gained over the prejudices of his age was, in the view of reason, more glorious than the bloody victories which stain almost every page of history; and his more generous exposition of the rights of conscience, of the independence of religion on the magistrate, than had been adopted before his time, gives him a rank among the lights and benefactors of the world. When I think of him as penetrating the wilderness, not only that *he* might worship God according to his own convictions of truth and duty, but that he might prepare an asylum where the persecuted of *all* sects might enjoy the same religious freedom, I see in him as perfect an example of the spirit of liberty as any age has furnished.

"Venerable confessor in the cause of freedom and truth! May his name be precious and immortal! May his spirit never die in the community which he founded! May the obscure individual, and the most unpopular sect or party, never be denied those rights of free investigation, of free utterance of their convictions, on which this state is established!"

SUPERSTITION OF PORTUGAL.—I was ill and shivering, though the evening was really warm; I therefore gladly established myself in the kitchen, for the sake of its roaring fire. The room was spacious, and imperfectly lighted, the chimney huge, and the roof high and pointed. Here I observed a man of singular appearance, sitting apart, and neither speaking himself, nor spoken to by others. His face was pale and haggard, his eyes deep sunk, and his hairs were prematurely grey. The borderer whispered in my ear that he was one of the dreadful Lobishomens, a devoted race, held in mingled horror and commiseration, and never mentioned without emotion by the Portuguese peasantry. They believe that if a woman be delivered of seven male infants successively, the seventh, by an inexplicable fatality, becomes subject to the powers of darkness, and is compelled, on every Saturday evening, to assume the likeness of an ass. So changed, and followed by a horrid train of dogs, he is forced to run an impious race over the moors, and through the villages, nor is allowed an interval of rest till the dawning Sabbath terminates his sufferings, and restores him to his human shape. If, therefore, a peasant chance to meet a pale and weary traveller at an early hour on a Sunday morning, he shudders, and in fancy sees the traces left by the infernal chase upon the stranger's haggard countenance. A wound inflicted upon the poor victim of this unhallowed agency during the very act of transformation, can alone release him from such an accursed bondage; a liberation supposed to be most rarely effected, because few men have courage to behold the appalling change in progress, and still fewer have sufficient coolness to strike the critical blow at the exact moment. Such is the superstition of the Lobishomens, diffused more or less over the whole of Portugal, but subject to different versions in different districts, and only credited implicitly in the wild and lonely wastes of Alentejo. —*Portugal and Galicia.*

INDIAN INK.—The Chinese, or, as it is misalled,

Indian ink, has been erroneously supposed to consist of the secretion of a species of *sepia*, or cuttle-fish. It is, however, all manufactured from lamp-black and gluten, with the addition of a little musk to give it a more agreeable odour. Pere Contancin gave the following as a process for making the ink :—"A number of lighted wicks are put into a vessel full of oil. Over this is hung a dome or funnel-shaped cover of iron, at such a distance as to receive the smoke. Being well coated with lamp-black, this is brushed off and collected upon paper. It is then well mixed in a mortar with a solution of gum or gluten, and when reduced to the consistence of paste, it is put into little moulds, where it receives those shapes and impressions with which it comes to this country. It is occasionally manufactured in a great variety of forms and sizes, and stamped with ornamental devices, either plain or in gold and various colours.—*The Chinese, by J. F. Davis.*

GREEN FIELDS AND GARDENS.—Perhaps there is no country in the world where green fields and quiet out-of-the-way places are more eagerly sought for than in England. I speak not of the enjoyment of them occasionally, but a thirst to possess some such spot, which has stimulated many a man to industry, such as few save Englishmen can contend with. Look only at London! What numbers you meet on a summer's evening, walking home to their picturesque dwellings, which lie perhaps five miles from the city. They care not for the fatigue of the long walk—nay, it refreshes them after a long day's application to business, and they feel a pleasure in knowing they will meet a lovely wife, and fair healthful children awaiting the return at the garden-gate: perchance their ears will be arrested by a sound of laughter echoing from the smooth greensward, where they are romping and tumbling over each other. Look at the healthful families that daily pour into the metropolis: they are not indwellers of the city, but live where the blackbird sings them to sleep in the evening, and where the early lark is heard singing above the paddock on which the chamber windows open. Many a father leans with aching head over the time-worn desk in the city, that his family may enjoy the pure air of the suburb. Many a merchant plods through the dull and feverish calculation of traffic for years, that he may at last retire to some quiet cottage which he can call his own, and spend the remainder of his days in peace. And is there no love of nature in all this? Watch some old citizen, seated in his little summer-house,—one who has been city-dried for fifty years of his life,—view him eyeing his little garden, and you will at once discover that he feels amply rewarded for all he has undergone. These things are beyond the reach of the poor; but still the heaths, and commons, and green fields are not. There is a pleasure in contemplating the happiness of others; and although we may never be so fortunate as to possess one of these earthly paradises, still there is nothing to hinder us from occasionally enjoying ourselves in similar scenes. We have yet left a few lovely places, where the flowers spring forth, and the shady trees offer a shelter, and the free birds carol as loudly as they did of yore.

There is nothing more delightful than for a poor man to have the right of walking over some rich gentleman's estate. He enjoys the wealth of his neighbour without envying him; he feels it is his own for the time, and lays the same claim to the fragrant breeze and the cool shade of the venerable trees as the lord of the estate. He sees the stately deer troop before him with as much pleasure as the owner of the soil; he enjoys a wealth which leaves the proprietor no poorer, and partakes of the happiness that renders others happy without diminishing the store.—*Miller.*

THE COSMOGONY OF MOSES.

ARTICLE II.

So when the evening had come, and the morning had come, one complete day or revolution of light and darkness, God, according to our cosmologist, resumed his operations, by causing a part of the waters to be evaporated through the expanded air. "Let there be an expanse,"* said he, "amidst the waters, which may separate waters from waters." And this separation is said to have taken place in the course of the second day, during which the atmosphere assumed the quality it has of raising such a number of small particles from the surface of the watery element as are necessary to form those copious showers by which the earth is fertilized, and without which it would be incapable of producing any thing.

Still, however, was the earth covered with waters; and a new operation was requisite to disperse these into proper receptacles, that the dry land might appear. This is called the work of the second day, and produced the distinction of earth and seas.† The former was now fit for vegetation, and was accordingly covered with grass, herbs, and trees, capable of re-producing themselves. This was the work of the third day.

By this time the atmosphere was sufficiently expanded and attenuated to admit the rays of the sun and other heavenly luminaries, which now, on the fourth day, began to shine with full splendour upon the earth, and of which the influence was necessary to the preservation and

growth of the vegetable creation. On the fifth day the waters were peopled with fishes, and the air with flying creatures; and on the sixth, the dry land was peopled with reptiles, beasts, and man.

Dr. Geddes, whose system we have thus unfolded, concludes his statement by remarking, "Such is the very concise account which our historian (namely, Moses) gives of the creation of the heavens and of the earth, or, as the order runs in another place, "of the earth and of the heavens;" as if the writer had meant to explain his own theory, and to limit the six days' creation to the rescuing of the earth from a state of desolation and darkness, by making light to shine forth upon it through the medium of expanded air, and the waters that covered it to subside and be collected into their proper places."

Whatever ingenuity this hypothesis displays, it does not, in my view, perfectly accord with the Scripture narrative, which is not less simple, while it is far more comprehensive. Hence we prefer their notion of the extent of the six days' creation who consider it as embracing the solar system, though not in the precise order in which the statement is made in the first chapter of Genesis. We may fairly apply the critical explanation of Dr. Geddes to the work of the fourth day, and suppose that the sun, moon, and planets, with the earth, were formed together; that the sun was created when the command was given "Let there be light;" and that the whole process was then carried on in the manner which the former hypothesis describes. This is the view of the subject given by the authors of the "Universal History," and the writer of the article upon creation in the "*Encyclopædia Britannica*." The latter concludes a very valuable essay with the following remarks:—"It has been conjectured, with great probability, that the creation of which Moses is the historian, was neither confined to the earth alone, nor extended to the whole universe. The relation which all the planets of the solar system bear to the same illuminating body, countenances the conjecture that they, together with the luminary by which they are enlightened, were all created at one period; but it would perhaps be to conceive too meanly of the benevolence, wisdom, and active power of the Deity, to suppose that, before that period, these had never been exerted in any work of creation. Yet even here we have no demonstrative evidence.

"On the supposition that the whole solar system was created at once,—which has, at least, the merit of doing no violence to the narrative of Moses,—the creation of the sun and the other planets may be understood to have been carried on at the same time with the creation of the

* "Expanse," i. e. an outspreading of dense air around the earth, called its "atmosphere," which is continually drawing up a large quantity of watery particles, that coalesce and float in the region of the clouds, until they become too heavy and fall in drops of rain. These are here called "the waters above the expanse." The expanse itself is denominated Heavens. The word "Heavens" has in the Scriptures three different acceptations. First, it signifies the air around us, where the birds fly, and where the clouds are gathered. Secondly, the whole visible sky, including the sun, moon, and stars. Thirdly, the invisible, supposed residence of the Divinity, or the heaven of heavens.

† "Seas." These are called by Moses, the waters below the heavens. These waters by being collected became seas and oceans. The waters separated by the expanse on the first day, bore but a very small proportion to those that yet covered the globe. It was necessary, therefore, to provide receptacles for these in the globe itself, that a part of it might become dry land, and productive. This was effected by giving to the earth's surface that inequality, and to its substance that porosity, we see in it. The liquid element subsided towards the centre wherever it found an opening, and the dry land emerged in consequence. From the Scripture account it should seem that the innermost parts of the globe are actually composed of water, with which, perhaps, all our seas have a communication. Hence the psalmist says, God hath "founded the earth upon the seas, and established it upon the floods;" and again, that "he hath stretched it upon the waters." It was evidently from these repositories that the waters had covered the earth at the time of the six days' creation; and the same are the springs or "fountains of the deep," that were broken up at the time of the universal deluge.

earth. In that case, even in the course of the first day, though no longer than our present days, those bodies might be reduced to such order, and their relative motions so far established, as to begin the distinction between light and darkness—day and night. On the second day we naturally understand from Moses's narrative, that the atmosphere was purified, and the specific gravities of aqueous vapour and atmospheric air so adjusted, as to render the latter capable of supporting the former.

"On the third day the waters were first collected into lakes and seas; but in what manner we cannot well determine. Some call in the operation of earthquakes; others, tell us, that when the earth was first formed, the exterior strata were, at different parts over its surface, of different specific gravities, and that the more ponderous parts now sunk nearer the common centre, while the lighter parts, still remaining equally remote from it as before, formed islands, continents, hills, and mountains. But these are mere fancies, and we have no facts to offer in their stead. On the latter part of this day vegetables were caused to spring up over the earth. Their growth must have been much more rapid than we ever behold it now; but by what particular act of supernatural power that might be effected, we should in vain inquire.

"On the fourth day the sun, moon, and stars were made to appear. But, according to the conjecture which we have mentioned as plausible,—though without ascribing to it the evidence of truth,—these heavenly bodies are to be considered as having been created before this day. But they might now begin to exert their full influence on the earth, in the same manner as they have since continued to do.

"The creation of the inanimate world was now finished, and the earth prepared for the reception of animals. On the fifth day, therefore, were the living inhabitants of the air and the waters created.

"On the sixth day the inferior animals inhabiting the earth were first created; and after that, the whole work was crowned by the creation of a male and female of the human species. To the account of the creation of the animals, nothing certain can be added in explanation of Moses's narrative. No more than one pair of the human species were at first created; the same economy might possibly be observed in the creation of the inferior animals."

These observations are sensible and pertinent, and they unfold the best interpretation of the Mosaic cosmogony that has yet been offered to the world. On such a subject we should receive every thing merely human with diffidence. Admitting, as we do most fully, the inspiration of the Hebrew cosmologist, he must be our only guide, and from his decisions we can make no appeal. If what appears to us rational and phi-

losophical be consistent with his general statements, we have a double reason for believing it; but if it is contradictory and opposed to it, we must reject it, knowing that God is wiser than man,—that we are liable to a thousand mistakes, but that a Divine Instructor cannot err.

Having thus considered the extent of the six days' creation, and assigned what appear to us to have been its limits, there are two other points, which, before we take a particular survey of the different works which it comprehended, are worthy of some attention; namely, whether the six days are to be understood literally; and whether any solid objections exist against the chronology of the facts as stated in sacred history.

On the first topic much ingenuity has been employed. A critic, whose name we have already had occasion to mention, pronounces it a beautiful mythos, or philosophical fiction. Some of the ancient Christian fathers esteemed it allegorical. Whiston and De Luc were far from understanding it in a literal sense. The former considered the six days as equal to six of our years: and is of opinion that the earth did not revolve daily round its axis but only annually round its orbit, till after the fall of man; and the latter maintained that these days are "indefinite spaces of time, which must have been very long, but of which we cannot hope to ascertain the precise length." To the first we reply, "Had the earth not begun to move round its axis till after the work of creation was completed, the immoderate degrees of heat and cold which its different parts would have alternately felt, would in all probability have proved fatal to both plants and animals." The second requires no answer,—it is wild and extravagant, by no means necessary, and not at all justified by facts. "I confess," says an elegant modern writer, "that my reverence for this volume (the Bible) makes me very reluctant to resolve into *allegory* any thing which wears the appearance of a *fact* on its pages, much more so to venture to call it a fable." The following reasons determine us in concluding that Moses designed it as a statement of facts, and that we ought to understand the phrase, "six days," in its literal sense.

The seventh day was instituted as a Sabbath, that in it man might rest from his labour, and more immediately serve his gracious Creator; and the reason, the only reason, assigned for it in the promulgation of the law was, that in "six days the Lord made heaven and earth, and all that in them is; wherefore the Lord blessed the seventh day, and hallowed it."

This is the reason always produced when the institution of the Sabbath is at all named; and in consequence of it, the seventh day was observed till the resurrection of Christ on the first day of the week; when, in perpetual remembrance of this great and glorious event, the first day be-

came the Christian Sabbath, and the seventh was laid aside. The apostle who wrote to the Hebrews quotes this passage from Genesis, in the second chapter, and at the fourth verse of his epistle; "And God did rest the seventh day from all his works." In his reasoning upon this passage, he makes no one remark which discovers the least approximation to an allegorical interpretation; much less did he seem to regard it as a beautiful mythos: on the contrary, every thing which he says throughout that chapter appears to ascertain very clearly, that he understood the phrase, "six days," used by Moses, in its literal sense.

To this reasoning we may add, that those who contend for an allegorical interpretation, have theories of their own to support, which render such a mode of interpretation necessary. And of those theories it is not too much to affirm, that they are as unphilosophical as they are contrary to Scripture. To adapt the creation of the world to systems of human invention, may be well as an amusement; but to attempt by such systems to perplex the meaning, or to subvert the authority of sacred history, is a very dangerous employment. We perfectly acquit the writers we have named of all sinister intentions;* but the obvious tendency of the lucubrations of one of them, at least, is to afford matter of triumph to the sceptic and the unbeliever. We confess ourselves to belong to that class of men who are slow in believing ill-imagined theories of the earth.

The accuracy of sacred chronology which fixes the era of creation has been impugned, but without success. What was intended to be destroyed was more firmly established by the very means used for its subversion.

The great antiquity of the earth was, a few years ago, a favourite topic with literary infidels. It was confidently asserted, that records and documents were in existence, which contained facts concerning the history of the globe many thousands of years anterior to the period stated by Moses as the beginning of creation. Philosophers came forward to confirm this appalling statement, by discoveries made in the bowels and on the surface of the earth. They in fact triumphantly quoted nature in opposition to revelation: but the increase of knowledge has put to flight both these classes of objectors.

It is now certain, that we have no credible history of transactions more remote than six thousand years from the present time. The Chinese, the Egyptians, the Chaldeans, and the Phenicians, have all laid claim to much higher

antiquity: but in bringing their pretensions to the test, it is clearly manifested that they do not deserve the credit which they demand. Their chronology is so absurdly extended as to exceed the bounds of probability, and to excite suspicion in respect of the facts themselves, which are the subject of these calculations. It has been stated, and rendered probable, by the learned writers of the Universal History, in their account of the Tartars and Chinese, that a great part of China was very thinly peopled so late as the year before Christ 657, when the Scythians, under the conduct of Madges, made an irruption into Upper Asia. We have a singular fact to state, which will prove that their boasted antiquity really falls within the limits of the Mosaic chronology. For the evidence which we are about to produce, we are indebted to the discoveries of modern astronomy.

The Chinese have ever made a point of inserting in their calendars remarkable eclipses, or conjunctions of the planets, together with the name of the emperor in whose reign they were observed. To these events they have also affixed their own dates. There is a very singular conjunction of the sun, moon, and several of the planets, recorded in their annals as having taken place almost at the very commencement of their remote history. The far-famed Cassini, to ascertain the fact, calculated back, and decisively proved, that such an extraordinary conjunction actually did take place at China, on February the twenty-sixth, two thousand and twelve years before Christ. This falls five hundred years after the flood, and a little after the birth of Abraham. Here are two important facts ascertained. The one is, that the Chinese are an ancient nation, although at that time perhaps not a very large one; and the other, that their pretensions to antiquity, beyond that of Moses, are unfounded: because this event, which they themselves represent as happening near the beginning of their immense calculations, falls far within the history and chronology of the Scriptures.

The Egyptians pretended in like manner to possess an exact narration for some myriads of years. Their inaccuracy is demonstrable from a plain matter of fact. They professed to preserve the records of other ancient nations as well as of their own; and their evident fallacy in relation to other empires, marks the dependence we ought to place on their history respecting themselves, and proves that we should receive their calculations with great caution, and under considerable limitations. When Alexander entered with his victorious army into Egypt, the priests professed to show him out of their sacred annals an account of the Macedonian and Persian empires, through a period of eight thousand years: while it appears from the best historical accounts, that the Persian empire was not then three hundred years old; nor had the Macedonian been

* No part of this censure is merited by M. De Luc. The object of his elementary treatise on Geology, is indeed worthy of a Christian philosopher. It contains much valuable information, relating to science and Divine revelation. But theorists are always in danger of running into extravagance.

founded quite five centuries. In order to establish their chronology, they make their first kings, on their own calculations, reign above twelve hundred years each; and for the same reason the Assyrians make their monarchs reign above forty thousand years. We might adduce a variety of similar instances of unbounded licence in the pretensions of the Chaldeans, Phœnicians, and some other nations. But it is unnecessary to pursue our inquiry farther. Such extravagance defeats its own purposes; since no dependence can be placed upon calculations so chimerical.

We are able to ascertain the periods when the most useful arts and sciences were invented; which could not be done with certainty had the world been of that remote antiquity which infidels affirm, because many of them would be involved and buried in obscurity. Mark the progress of science; observe how soon it arrives at the perfection of which it is capable! What elucidation a few pages throws upon theories previously obscure! In the lapse of comparatively a very few years, the hand of time uncovers a fund of knowledge which was veiled in perplexity and uncertainty. How many useful arts are invented, and how many interesting discoveries are made in the course of a single century! Calculate upon the most tardy progress of the arts imaginable, and determine whether those of which we are now in possession are at all equal to that which we might reasonably expect, if the world had been as aged as some pretend, and if human genius had been gradually, however slowly, penetrating the darkness, and dispersing the cloud of ignorance. If it be urged, that floods, and fires, and wars, with ten thousand nameless hypothetical desolations, may have destroyed a number of useful inventions; we answer, the number of these must have been prodigious indeed, and absolutely inconceivable, to have produced a devastation of the arts which should be able to counterbalance the inventions of science, which in the supposition of the world's extreme antiquity might be expected; nor could we with such facility determine the periods when these useful arts were discovered, if the chronology of the world extended far beyond the Mosaic history. Admit that the world were twenty thousand years old, we should necessarily be in uncertainty with regard to the rise of the most simple and useful inventions, because of their extreme antiquity. The fact, on the contrary, is simply this: that the necessities and conveniences of life, civilization and commerce, the invention of the arts and sciences, the letters which we use, the language which we speak, have all known originals, may all be traced back to their first authors, and these all far within the circle of six thousand years; none are found to exceed it—no, not one.

In the same manner we are able to trace the

origin of different nations; which we could not do with certainty had the world been much more ancient than the Mosaic statement reveals. We can look back to the greatest empires of the present day; and we can also mark the rise, the meridian splendour, and the decline of those which preceded them, till we arrive at a certain point beyond which we know nothing; and this point extends to about the standard assigned in the Mosaic account of the creation. Should earthquakes and floods be again pleaded as having destroyed nations as well as sciences, and thus reduced the world to a second infancy—if any remained, we might naturally conclude that the most useful arts had been preserved, and that some wrecks of mighty nations would have survived the desolation, at least, to tell a tale of woe to succeeding generations. But a system begins to be in danger, when those who maintain it are reduced to the necessity of supposing things which might, or might not happen—where probabilities are against them—and when, if their arguments are admitted, the slender causes they assign are in themselves inadequate to the production of effects so extensive as they wish to establish.

Without entering into the philosophical objection against the era of creation, derived from geology, we refer our readers who wish to obtain correct views on the subject, to the productions of Professor Sedgwick, Dr. Buckland, Cuvier, and especially Lyell. The following observations of De Luc are worthy of their very serious consideration, who have a smattering of philosophy mingled with a great deal of infidel conceit; nor ought they to be disregarded by an opposite class of persons, who, in their eagerness to press philosophy into the service of religion, are not sufficiently careful to distinguish the discoveries of science from mere speculation and theory.

"If there be a science in which advances ought to have been made with scrupulous caution, it is geology; for the history of the earth is inseparably connected with that of man. The other speculative sciences are, for the most part, interesting only to those who cultivate them, and the errors which they may commit are of little consequence to the rest of mankind; but every man is greatly interested in the decisions which respect his abode; for if it can once be ascertained to have undergone various revolutions, some of these may have involved the human race, and on them may depend the solution of the question, 'What is man?'

"It is here only that I shall permit myself to make an observation on this subject, in order to point out its importance; and this it is incumbent on me to do, to the end that they whose precipitation I have blamed, may be more upon their guard. Geology was useless to man in a moral view, previously to the appearance of those numerous systems which were hazarded in the

course of the last century. To the Jews, the Christians, and the Mahometans, the book of Genesis presented the history of the earth and of mankind; and if the Pagans were not favoured with such direct means of information, the grand outline of their mythologies bore so striking a resemblance to the Mosaic records, that it was impossible not to acknowledge them to be, in common with the other nations, the descendants of Noah; a circumstance which strongly confirmed the authority of Genesis to those who were so fortunate as to possess that exact history of the origin of the human race, and of the principal events which have befallen it.

"No essential information, therefore, upon this subject was wanting to men; nor, indeed, can it be conceived that such knowledge should have been withheld from them, if they be considered only as the rational and moral creatures of a God infinitely wise and good; for such a Being could not have suffered them to remain ignorant of his existence, and of the relations which they bore to him. This reflection alone enabled the Theist to repel the arguments of a few sceptics against the reality of a revelation from God to men.

"But a complete change was made in this state of things by geology. All those who have formed geological systems have endeavoured to rest them upon facts which relate to the history of the earth. This has called back the attention of men to that history, as it is contained in Genesis, and consequently to that of the human race with which it is connected; and it was soon inferred that if geology were contrary to Genesis, the latter must be fabulous. All attempts to elude so evident a conclusion would prove vain; and it must of necessity be admitted, that if geology be a science founded on facts, and on strictly logical deductions, having attained all the characters of truth, were in reality found to be in opposition to what Genesis relates of those physical events of the earth which are intimately connected with the human race, the history of the latter would become vague and uncertain. This is a consideration which I offer to those whose profession is to teach and defend revealed religion. The weapons by which it has been attacked have been changed, and our modes of defence must be adapted to the arms of its assailants. They now attack it by geology; which therefore becomes a science, too, essential to theologians, as the study of the learned languages, or of these ancient arguments which are already much neglected in the present times, and which must henceforth derive their chief support from the very science, through the medium of which, under the pretence of an appeal to facts, it is attempted to set them aside.

"In proportion, therefore, to the influence which geological systems will necessarily have, must be the caution observed by the friends of

mankind in their inquiries respecting this great object. No general inference, indeed, drawn from the physical sciences, could be more important to men than that in which Genesis was involved; for to consider that book as fabulous was to plunge them into final uncertainty with regard to what it most concerned them to know, viz., their origin, their duties, and their destination: it was sapping the very foundation on which the great edifice of society has always rested; it was, in short, abandoning men to themselves; and those must have been little acquainted with them, who did not foresee the fatal consequences which would inevitably ensue.

"Now the naturalists who first published geological systems contrary to Genesis, were guilty of this want of consideration; for time has pronounced sentences on them; all these systems have already fallen, in consequence of the increase of knowledge; and thus is become obvious the imprudence of their attack on that which a sublime tradition had established among men. Impelled by the love of fame, and solicitous for reputation, they lost sight of that future state which constituted the chief value of their own existence, and were wholly inattentive to the rest of mankind. This is the most favourable interpretation of the conduct of those who have manifested, and still continue to manifest, such levity and imprudence in their geological pursuits.

"I shall not apologise for those who, without possessing a greater share of information, have treated the same subject with a view of defending Genesis. For this premature undertaking has likewise produced various chimerical systems; and their authors did not consider, that, as the science of which they ventured to treat was of vast extent, they could not flatter themselves that their researches had been sufficiently deep to guard them against the danger of being contradicted by new facts, and of thus injuring the cause which it was their object to defend. And so in reality it has happened; for the adversaries of Genesis, by overthrowing those groundless systems, imagined that they triumphed over Genesis itself. While geology, therefore, was in its infancy, philosophers should have contented themselves with pointing out the errors of the anti-mosaic system, for which the state of physical science was sufficiently advanced to have readily furnished them with the means; and they should not have hazarded theories, before they had taken every requisite precaution to fix them upon an immoveable ladder.

"I shall no longer dwell upon the connexion subsisting between geology and Genesis. In advertent to it in this place, I have been influenced by no other motive than the obligation to set forth the importance of this subject; and I solicit the attention, not only of those who themselves endeavour to form systems, but of that

more numerous class, consisting of those who read them, and wish to form fixed opinions. This is not merely one of those subjects of natural history, or natural philosophy, in regard to which it would be of little consequence to mankind whether erroneous theories were formed or adopted; a most important moral object is combined with it, by the indissoluble connexion which subsists between the history of the human race and that of the earth,—an object which ought to be always kept in view, as well by those who, not pursuing the road which alone can lead to truth, may betray mankind into fatal error, as by those

who, not having qualified themselves by previous study to judge of these systems, embrace hypotheses from mere appearances.

Having thus met a few important questions, involving the consideration of various difficulties which naturally occur to a reader of the Hebrew cosmogony, we now feel ourselves in the situation of those sons of God who watched the progress of the mighty undertaking, from the moment of its visible commencement till its final completion, when the Almighty surveyed his perfect work, and pronounced it good.

THE MIDNIGHT REVIEW OF NAPOLEON.

'Tis dead of night, and the full moon's light
Is struck with eclipse pale,
And deep and low, like a voice of woe,
Through the forest comes the gale.
'Tis like the hour when things have power
Of might and mystery;
When reason shakes, and man awakes
To all he dreads to see.

And on yonder cloud, like a mighty shroud
Hung over the lifeless earth,
Are shifting bright, on the dazzled sight,
Strange scenes of grief and mirth;—
Plays, battles, banquets in high halls,
Wild plains with corpses strew'd,
Kings crown'd, kings stretched in funeral palls,
Feast, pageant, frenzy, blood.

There to the deep thy waters sweep,
Soft Seine, through myrtles wound;
There to the brown Italian plain
The Alpine torrents bound;
There through the Austrian's pleasant field
Thy billows, Danube, pour;
The Turkish lance, the Roman shield,
Lie mouldering on thy shore.

And there the Nile bathes many a pile
Of old Egyptian kings;
There Dnieper's bed is gory red;
There, Don, thy crystal springs
Are dark and faint with corpses' taint,
And the wild Cossack sweeps by,
For the judgment has come, and the snow is the tomb
Where the murderer's host must lie.

But what is the sound rolling round and round?
'Tis the beat of a midnight drum;
And from many a land the spectre band
At the sound of that larum come.
From south and from north they are flocking forth,
From the field, from the ocean-wave—
For there are all who held earth in thrall,
Dark battalions of the grave.

And they come on the plain, like the drops of the rain
Falling thick in a thunder-shower;
But no footstep's fall, no trumpet-call,
Is heard through the sons of power.
The moon's last light just quivers white
On a harvest of helm and spear;
But no eye of man could stretch from the van
Of that host to the cloudy rear.

Still on they come from the earth's deep womb,
In column, and square, and line;
All fleshless bone, with eyes of stone,
The moonbeams through them shine.
But their fingers grasp, with deathless clasp,
The bridle and lance and sword,
And the eagles wave o'er the ghosts of the brave,
Which once o'er their glory soared.

And on front and on wings their chieftains and kings
On their pawing chargers ride;
There he whose crown was cloven down
On the Calabrese mountain's side;
There he who fell when Austria's yell
Rang wild from Marengo's plain;
There he whose blood dyed the Leipzig floor,
When the German shivered his chain.

And he, the last on whom death had cast
The grasp of his icy hand,
With eyes that smite like the arrow's flight,
In the front of the host takes his stand.
On his brow of gloom is waved no plume,
On his breast is no steel mail,
But an iron crown throws its flashes down
On his spectral visage pale.

And by his side is simply tied
A little long-sheathed sword;
No gold is there, no jewel rare
Betrays the battle's lord;
But the lightning's wreathed round that steel un-
sheathed,

And the thrones of Europe reeled,
For the sickle of death was in that sheath,
And the world was its harvest-field.

On his charger white, through the livelong night,
He passes in pale review
The skeletons to whom earth's thrones
Were once but dust and dew,
And the banners stoop, as each ghostly troop
Moves before its silent lord;
And one word of woe each murmurs low,—
Saint Helena is that word!

Still on they crowd from the worm and the shroud,
In fleshless millions on;
And the star of pride is on each side,
And the spear in the grasp of bone;
Till the march decays on the chieftain's gaze,
And the thistle alone is stirred,
As the wind comes low with one sound of woe,—
Saint Helena is that word!

A SCOTTISH SACRAMENT.

CHAPTER III.

ABOUT half past four the service was over; and Tom and I went to partake of that simple dinner which was customary on those occasions. The village, and indeed the neighbourhood for many miles round, contained no regular house of entertainment, at which strangers might find refreshment, or the people be tempted to spend their money and their time, neglect their duties, and contaminate their morals. But as on the sacrament Sabbath many more strangers resorted to B—— than could be accommodated in the houses of the residents, and who did not wish to be so accommodated, there was provision made for them for the time. The viands were simple, consisting of penny rolls and small beer, at three-halfpence a quart bottle; but the bread was good, the beer fresh, the air healthy; and all were too much interested with the services of the day for troubling themselves about any matter of mere worldly enjoyment. They were of all the different ranks of which a rustic population is composed, and they were seated in the large barn of a farm house; but it is probable that not many feasts consisting of the choicest dainties that can gratify the palate of the epicure, were ever eaten with more zest, or contributed more to health, than the penny rolls and the small beer upon this occasion. Tom Allan and I had a roll a-piece and a bottle of small beer between us. We ate our dinner in silence; and indeed there was little sound of voice accompanying the meal, saving blessing and thanks to the Giver of all good, which though not loud were fervent, and repeated from many parts of the temporary abode.

When Tom and I had finished our repast, we walked out through the little street of the village, and along to the fields. As we passed through, we heard the voices of psalms or prayers from many of the houses; and all was so still and decorous, that it seemed a Sabbath indeed—a day of rest, holy to the Lord, and honourable, in the simple perfection with which it was observed.

At half an hour before six we returned, and found the greater part of the people assembled on the green bank opposite to the tent; and there were many there who had not appeared at any previous time of the day. The evening sermon on the sacrament Sabbath at B—— was indeed a general gathering of the people of that country-side, which was attended by numbers both from the neighbouring parishes, and from the dissenting meetings, who did not think proper to desert their own places of worship until the service there was over. All who came, however, came with a sincere desire of hearing the gospel in its purity; and Dr. S. took care that their pious intentions should not go unrewarded.

It is not the custom for the parish minister in these places to officiate personally on the evening of the sacrament Sabbath; and indeed he is generally too fatigued by the duties of the preceding part of the day for being able to do this. It is however understood that, as this sermon is as it were the gleanings after the vintage, it shall be delivered by one who is competent to do it justice.

On the present occasion, the officiating minister was Mr. M——, the most popular preacher in a town some twenty miles distant; and he had, after performing the morning service in his own church, rode to B—— for the express purpose of delivering this evening sermon. He was eminently qualified for the task, being a man of powerful stature and voice, and capable, without fatigue or over-straining, which is always unpleasant in a preacher, of making himself distinctly heard by the most distant member of his congregation. When in a state of quietude, the expression of his countenance was stern, and one might almost say forbidding; but when he entered the pulpit, and ministered in the service of his Maker, he brightened up, so that the countenance of the preacher was a great contrast to the countenance of the man, and of itself proclaimed the beneficial influence which genuine religion has upon human nature.

His text was well chosen. It was the last two verses of the ninth chapter of St. Luke's gospel: "And another said, Lord, I will follow thee; but let me first go bid them farewell, which are at home in my house. And Jesus said unto him, No man having put his hand to the plough, and looking back, is fit for the kingdom of God."

Mr. M—— showed, in the clearest and most impressive manner, that religion which is confined to the public services of the church, whether of a more ordinary or of a more sacred character, is no religion at all: but that it is a mockery and profanation if we do not carry it home with us, and make it at once the regulator and the comforter of the whole life and conversation. That every man "having put his hand to the plough," more especially in those solemn rites which the Saviour has appointed, in commemoration of his mission upon earth, must not look back; but must, in all that he thinks, and in all that he does, keep his face steadily toward the Zion of his God, and have the obligation of the holy covenant always before his mind, so that he may, in all things, glorify upon earth that great Redeemer by whose intercession he is saved from eternal woe. In the discourse these doctrines were of course amplified, and they were interwoven with a luminous exposition of the doctrine of salvation through Christ; so that this

evening discourse formed a most appropriate summing up of what had been done during the day; and though it is unnecessary to go into the details, it would be injustice to the preacher to say that it did not produce a very powerful effect, and though long, was heard to the conclusion with breathless attention.

The prayer and the psalmody which followed were equally appropriate; and when Dr. S. stood up to implore the best blessing of the Holy Trinity upon the doings of that day especially, and upon all the outgoings and incomings of the assembled people, there was literally a foretaste of heaven in it.

We left B—— with still enough of sunlight to carry us great part of our journey; and as the day was fine, and the road was safe and pleasant, we took our departure with light and joyful hearts. On the first part of our journey we exchanged but few words, for each, I suppose, had fallen into his own train of meditation upon what he had seen and heard. When we gained the top of the hill, where the ancient cross marks the grave of the warrior of old, we simultaneously turned to look down upon the low and rich country, now streaked with shadows from the intercepted beams of an almost horizontal sun. We stood for some time looking at the scene, to gain breath, which had been tried by the steep ascent, as well as to admire the exuberant beauty of nature which was amply spread before us.

"I think I can answer my own question now," said Tom Allan, "and tell you who Christ is; for this day I have learned, and the

knowledge is not more new to me than it is delightful; but let us pursue our journey, and I can tell you as we walk along."

The knowledge which, in the course of a single Sabbath, Tom Allan had acquired of the Christian religion, and the nature and purpose of the Divine mission of the Son of God, seemed to me much greater than my own, though I had been schooled in religious knowledge from my earliest infancy. He lost no part of the liveliness of his disposition, but became a more delightful companion than ever, and we pursued our limited and humble observations in fonder brotherhood than we had previously done. Tom mentioned to his father the desire which he had of attending the school in the next parish, where the teacher was celebrated for his abilities. The father consented, and so diligent was Tom in his studies, that in less than three years he was in a condition for resorting to the University of —, and gained, by competition, an exhibition or "bursary," as it is there called, nearly sufficient to cover the whole of his expenses. Soon after this I was called into distant places, and did not again visit that part of the country until twenty years had elapsed. Upon returning at this time, I found that Dr. S. had been gathered to his fathers, in the fulness of time, and that Tom Allan had succeeded him in the pastoral charge of B——. I lost no time in paying him a visit; and he said, "If I had not asked, Who is Christ? and you replied, 'Come along with me,' I should not have been in my present situation, and might have been without God in the world."

THE PRESS.

THE utility and influence of the press, in the world of our moral being, is strikingly and beautifully analogous to that property of the atmosphere of our physical universe which we call "reflection." For, as by this simple, yet wonderful contrivance of nature, not only is light from the great luminaries transmitted to us, but every visible particle of matter is made by radiations, in turn, to contribute to the general stock of light and glory by which we are surrounded, until earth is filled with beauty, and heaven with splendour: so the "press" not only transmits to us, from their rich and elevated sources, the world-enlightening rays of genius and science, but even the smallest radiations of mind, the feeblest scintillations of intellect, are enabled, by its aid, to render their minute beauties visible; tending, by their infinite number, rather than by their individual importance, to promote the general spread of knowledge, and the consequent improvement of society. Genius dazzles and delights us; but it is the multitudinous radiations from inferior minds which make us acquainted with those ten thousand proximate objects upon

which our happiness and well-being in a great degree depend, yet which, but for the "press," would, perhaps, entirely, and for ever, have escaped our notice. Who can feel himself to be thus standing amidst the hundreds of millions of intellectual radiations which this agent of light is continually diffusing in profuse splendour around him,—filling the once dark and gloomy region of our moral world with a flood of light,—and not rejoice in the consideration that such a medium for communicating knowledge has been discovered; not adore the beneficent wisdom which has provided such a means for the delight and improvement of his rational creatures? As without the property of "reflection" in the atmosphere, though the glorious luminaries of heaven might still walk in brightness the paths of their magnificent orbits, rejoicing in their undiminished lustres, or repose themselves in solemn grandeur on their everlasting thrones, cheering and delighting the worlds of creatures by which they are immediately surrounded, yet we should derive no advantage from their existence, no delight from their career of glory; deprived of

its aid, even the world of light itself would communicate no light to us; nor the canopy from which ten thousand lesser brilliants now shed their streams of radiance upon our path, be other than a starless void, a dark and gloomy waste: so, were the vivifying labours of the press suspended, though those mighty master-spirits of our common nature,—those worlds of intellectual energy which, as it were, of themselves, create the light in which “they live and move”—might continue, though withdrawn from their influence over meaner minds, to solace their own spirits in the unborrowed wealth of native genius; might still pursue in solitude their godlike course,

revelling and rejoicing in all the delights of refined and elevated intellectual existence,—we, who walk but by the reflexion of their light, who shine but by reason of their brightness, and are mentally visible to each other but as we radiate the scattered beams of their profuse effulgence, should soon present, in our degradation and debasement, the appalling spectacle of a dark moral chaos, where every thing which now instructs, and charms, and ennobles, would speedily be buried beneath an ever-gathering, ever-deepening cloud of cheerless, undistinguishable barbarism.—*Recreations in Retirement.* 1837.

THE YEWS.

MANY reasons have been assigned for the frequent occurrence of yews in our churchyards; to me it has always seemed most natural and simple to believe, that, being indisputably indigenous, and, from its perennial verdure,* its longevity, and the durability of the wood, at once an emblem and a specimen of immortality, it would be employed by our pagan ancestors, on their first arrival here, as the best substitute for the cypress, to deck the graves of the dead, and for other sacred purposes.† History and tradition concur in telling us that it was allowed as a tribute to departed worth or friendship, under that new and purer system which confirmed to them the cheering prospect of a reunion after death with those who had shared their pleasures and affections here. It was also closely connected, in the superstitions of our simple forefathers, with ghosts and fairies.

In a very ancient Welsh bard, we are told of two churches eminent for their prodigious yew trees:—

“*Bangor Esgor, a Bangebyr Hênllan*
Ysiedr clodvan er clyd Ywyx.”

Which has been thus translated:—“The minster of Esgor and that of Hênllan, of celebrity for sheltering yews.” Hênllan signifies an “old grove;” thus proving that its church stood where druid worship had been performed. There can be no longer any doubt of the real origin of planting it in our churchyards. And if it be said that this, its usual though not natural situation rather proves the venerable trees we find there not to be older, at most, than the introduction of Christianity, it may be stated in reply, that our earliest Christian churches were generally erected on the site of a previous heathen temple, and that at least one motive for

placing them there would be their proximity to trees so sacred, already venerable for size, and indispensable in their religious rites. That these rites were performed, and altars erected, in groves, from the highest antiquity, we know from the Pentateuch. The devotions and sacrifices of Baal among the Moabites, and the idolatrous rites of the Canaanites and other Gentile tribes, were performed in groves and high places. The druids chose for their places of worship the tops of wooded hills, where, as they allowed no covered temples, they cleared out a circular space, and erected their circles of stone.‡ Many of the first Christian churches were built, and intertwined with green boughs, on the sites of druidical groves. When Augustine was sent by Gregory the Great to preach Christianity in Britain, he was particularly enjoined not to destroy the heathen temples, but only to remove the images, to wash the walls with holy water, to erect altars, &c., and to convert them into Christian churches. These were the *designata loca gentilium*, in which our converted ancestors performed their first Christian worship. *Llan*, so general a name for towns and villages in Wales, is a contraction of the British *llwyn*, a grove: and, strictly, means an enclosure, rather than a church, the places so designated being probably the earliest inhabited spots, and also those where religious rites would be celebrated. *Eglwys* means a “Christian church,” (*Ecclesia*.) and probably those were so called which were first

‡ Many of the remote Welsh churches are on little eminences among the wooded hills. It has been suggested whether the words kirk and church might not originate in *Cerrig*, a “stone,” or “circle of stones,” the first churches having been placed within these circular stone enclosures. The word *Cuer*, a “camp,” is also used in some parts of Wales, for the wall round a churchyard. Some writers believe that round churches are the most ancient in England. A circle was the most sacred symbol, among the Eastern nations, of antiquity; and it would be interesting to know whether the raised platform, within a circle of stones, which is sometimes found around old yews, as in Darley and Llanfoist churchyards, is not a remnant of this superstition.

* Its very name seems to be derived from the Celtic, *iw*, signifying “verdure.”

† In some parts of Hampshire it is still the custom to sponge the bodies of the dead with an infusion of yew-leaves, under the idea that it retards or prevents putrefaction.

erected after the introduction of Christianity, and not on the site of a heathen temple. History and tradition give their concurrent testimony that the yew was held sacred by our remotest ancestors; and we cannot avoid concluding that many of the specimens which still survive, must have been planted long before the first promulgation of Christianity. Nay, some yews, still standing, are probably above three thousand years old. Who, without emotion, can look upon one of these primeval giants, the oldest of living forms,

which after braving the storms and accidents of so many centuries, after being the contemporary of successive dynasties and governments now swept away, and surviving various changes in the customs, nay even in the language and religion of the country, still enjoys a green old age, and promises to remain, for centuries to come, the living though unconscious witness of other unforeseen events and changes, when we shall have joined our fathers beneath its shade?—*Mag. Nat. Hist.*

FICTION.

SECOND ARTICLE.

In a paper in our second number we led our readers along with us, in the bonds of a happy and cordial friendship, through the radiant and flowery ages during which the beauty and harmony of imaginative fiction was nurtured, fed, and cherished, by the united kindred of mankind, as a rich and a warm delight—as a thing to be reflected on in the circle of household relationship, and by the fireside of mutual friendship—amid the wide-spread fields and plains of nature—as well upon the mountain-top as amid the sequestered and secret solitudes of hidden valleys. And now, kind and gentle reader, after this wild aerial flight of thoughtful and dreamy fancy, (though all the while claiming companionship with a sincere but gentle philosophy,) will you permit us to settle down our wings in the early noon of an unclouded sunshine, whilst we reason, in gentle mood withal, upon the theme and subject of our contemplations, and set before you some of those speculations of mystic and quick fancy which, as we write, spring up like the increasing abundance and ambrosial odour of new-born spring flowers around us.

Many and numerous have been the ingenious and beautiful speculations of thought, in which the lonely student and the reasoning philosopher have indulged, concerning the sources of that pleasurable delight into which the mind enters, after the perusal of those writings which involve in their narration a series of fictitious adventures, as well as concerning the reason why this delight is more lively and more generally felt, than is the satisfaction which we receive from perusing the pages of truth and history. Beattie, in his "Essay on Fable and Romance," has considered it as an effect and result of the moral weakness and degeneracy of our nature, which, too grovelling to appreciate and understand the beautiful and majestic loveliness of truth, surrenders itself up as a most willing slave and captive to the masked and meretricious allurements of fiction. Lord Bacon, in his "Essays," tells us, that the soul, tired with the even and dull uniformity of life, disgusted with the cold

and icy tameness of real characters and events, so disproportionate to the nobility of its exalted nature, and to the lofty dignity of its final destination, rejoices to escape, in its gladdening freedom, into the rich and luxurious regions of fancy, where it can delight itself in ever-varying combinations, and gratify its high aspirations by the contemplation of personages rich in the united assemblage of all possible perfections. The true and solid sources of that pleasure which we derive from the perusal of, and after-reflection on, the pages of a fictitious narrative or a dramatic composition, in the quiet secrecy of our study, may be said to arise from the union of our sympathies with the feelings of the persons brought before us in the narrative or the drama, and from our curiosity being powerfully awakened and excited to know what may be the probable future fate and destiny of those same persons who have been by these means introduced to our notice. But our participation in the sympathies, feelings, and passions thus delineated soon becomes wavering, unsteady, and eventually droops, unless we are kept constantly enlivened, in all our sensations and perceptions, by the continued development of a well-connected and skilfully-arranged series of critical situations, circumstances, and trials, which shall call forth, in their narration, all the more vivid and powerful sentiments of the mind, so that even thought shall become like an over-charged and sultry summer atmosphere, filled with the rich and radiant fusion of mental and spirit-like electricity. The softer, and gentler, and finer feelings, also, of our nature, must be brought into vivid action; our own individual interests in the world, and its inhabitants around us, under whatever aspect they may shine, must be aroused by the intervention and assistance of those fortuitous events which, as they happen to the character whose life, conversation, and adventures they narrate, so, if they be powerfully and vividly expressed, (without which most fictitious narrative will fail,) they will awaken in our own minds the recollection of a past similar event or circumstance which may have happened

to ourselves; or they will carry us along with them into the regions and recesses of an unknown future, wherein may lie buried the very germs and seeds of a precisely similar adventure, or series of adventures, in which, as destiny or fate may devise or divine, we may perform the part of Hamlet or Harlequin; for, as the hand and will of an unseen guide, guardian, and director may choose, we may be sublime either in our dismay or despair, or become the simpleton and the buffoon amid the jeers and laughter of those who look upon the world around them with the same *Æsop-eyes* with which they look upon a grand and gorgeous pantomime. Unless our thoughts and sensibilities are thus awakened and aroused from their dormant and leaden sleep—unless our complete and entire faculties are thus stirred up and fired—unless we are thus led into the inner *penetralia*, and can have all the characters laid bare before us, and compare their feelings and passions with those which thrill and throb within our own bosoms, the awakening interest and sympathy of our hearts will be none, our co-equality and co-partnership with the ideal will become diluted and dissolved “by mutual consent,” and we shall but reap the same wintry and barren share of mental harvest from reading such a sullen and spiritless narrative as we have thus negatively described, as we should gather from the simple solution of a riddle, or the childish disentanglement of a puzzle.

We need scarcely in this place remark, that the above traits and incidents, appealing as they do more powerfully than all others to the mind of the reader, are more frequently sought for, and are also most frequently found, in that class of fictitious narratives of life and composition to which the term “novel” has most commonly and generally been applied. It may be expected, therefore, that we should offer a few general observations on this most fruitful and fertile theme; and the present opportunity appears to us, indeed, to be the most fit and proper one that we could select for such a purpose. The following general remarks on novels and novelists we have selected, arranged, and condensed from a variety of sources: they will serve to give our readers a general and extended outline of the subject, which they can fill up by an extensive study and perusal of those topics and subjects to which we shall more minutely and particularly draw their attention as we proceed. We must, in the outset, reserve to ourselves the opinion and right of expressing our sentiments as to the engendering and diffusion of principles which such works as those to which we are now more particularly adverting are calculated to aid in and assist, whether they be of good report or evil report,—whether they affect an undivided individual welfare, or ramify and spread their peace or poison over large and extended masses of the public community.

It is an universally acknowledged fact on all

sides, that the novel is the only form and species of composition to which the talent, genius, or invention of modern literature can lay any just or well-founded claim; and as it bears on its front the impress, aspect, and appearance of being clothed and invested in a form as nearly approaching to the natural one as any that exists, it will not become a subject of much wonder that much discussion and speculation, both learned and vulgar, should have been hazarded upon the conjecture as to the cause of its remaining untouched, to all intents and purposes affecting its vitality and stability, by those other authors and literary composers who have carried dramatic composition on the one hand, and historical display and research on the other, to their highest and loftiest altitude of classical perfection. Indeed, it has been maintained and proved, by many clever and ingenious writers, that, in point of fact, the manners and customs which were prevalent in the olden times of a renowned and classical antiquity, did not present to the scholar or literary observer a field for this kind of structural and delineative composition at all equal to or fit to be compared with that which social life, as it exists and has existed in modern times, supplies. The division of a vast and barbarous population into the two great classes of freemen and slaves, abridged, as a matter of necessity, in a miserable manner, that wide extent and range which the social sympathies and friendships of modern times are permitted to enjoy; whilst the almost exclusively oriental division and separation of the sexes from each other, in the higher as well as in the lower classes of life, implied and seemed to keep up, if possible, a still more unhappy defect of the interests of a liberal and humanising community. It were false and absurd to deny that the effect of the prevalence of such circumstances as these must have been sought for and found in the exertion of an extensive and most unfavourable influence upon the entire creation, being, and aspect of society in the ancient ages; but we must be permitted to entertain some sceptical doubts upon the decided fact, that the influences which we have detailed could ever have been found to operate to the great and serious extent which the above remarks would assume: we will, therefore, give the reason for the faith that is in us. We have the poets, the historians, and the philosophers of antiquity before us, as developed in their lives and characters which have come down to us; the fragmentary specimens of the arts and sciences of the same period of the world still, in the present day, remain as so many specimen-impressions of the genius and talent which distinguished alike the artificer and the pupil of science; whilst the influence of that intellect which was rife in those days, is stamped in indelible traces on every European language, as well as on every system of jurisprudence that has ever yet been applied

or employed for the purpose of regulating the most simple and ordinary transactions of everyday social life amongst any class of the civilised or humanised community. It would be a very difficult matter, we suspect, to find any one who could resist a smile at hearing it maintained that a Fielding or Le Sage could have been at any loss for materials amidst a society so exquisitely refined and complicated as the recorded decisions which have been handed down to us of the old Roman lawyers would seem to imply. But for the support of this argument, we have no need to call in the aiding assistance of any extraordinary or special authority. Artificial institutions may be as ill arranged and devised as they are clumsily put together, yet their heterogeneous and chaotic formation will not deprive us of the very members who form part and parcel of their entire mass, and who tend, by their numerical strength, to support the crazy and disjointed structure they have raised over their heads: the men and women, parents and children, lovers and friends, servants, slaves, and masters—these are not taken from us, but remain in their mutually dependent and depending situation relatively to each one around them; they still have, and still retain within their breasts, the conscious moral dignity of their nature, and the superiority and excellence of all virtuous principles; though, whilst they remain among the dwellers of the earth, and the tillers of the ground, they must remain the subjects of the temptation of the things of sense, and the tyranny and despotism of passion. We may look back to the ages of the creation and the deluge, and we may consider the events and circumstances that have shook the nations of the earth like a whirlwind, from that genesis of all things, even until the present days of the world's ancestry, and we shall find that, in every age, and under every moral and social aspect affecting the people of a civilised community, the great and leading elements of social interest and support must have been, and we might add, always have been, one and the same. Laws might have been made, and orders and regulations might have been issued, for the order of processions, or the march to a saturnalian festivity, and these might have been strictly recognised and abided by; but we should be inclined to venture some very strong doubts as to whether the same obedient and decorous propriety would have been observed had these edicts extended also to the full assurance of domestic comfort and conjugal happiness to the husband of a Xantippe, or to the total prevention of an Arria from dying with her Pætus. To speak the truth, it does appear to us to be an assertion which is strangely out of place, and falls very far short of the mark which it would hit, to look upon slavery, as it existed in the days of Greece and Rome, as blotting out nearly three parts of the population from the map of manners

and customs; especially, too, when we reflect that it was to that very dark and degraded condition of human life that we are indebted for a Dromio, and for a Terence who drew him. And highly, we are willing to own, as woman is indebted to the religion of the Bible, and the gallantry and renown of Gothic chivalry, we may look in vain to find any charm of the female character entirely destitute of a homage at once respectful and lofty, amongst the people of those nations who could value, and therefore appreciate the amatory delicacy evident in the *Anthologies*, the filial piety and regard of an *Antigone*, the conjugal devotion and attachment of an *Alcestis*, or the majestic despair and lofty sorrow of an *Andromache*. We may possibly concede it as a matter of regret, that, amongst the literature of the ancient times—which have been handed down to us, we should have had no production of that fictitious nature generally denominated a “novel.” But it would assuredly argue a strange and vain-glorious want of sense, were we unhesitatingly to decide that the materials going to the formation of any class or species of imaginative composition could not have been found in richness and abundance amongst those civilised communities of Greece and Rome who, from the knowledge we possess of them, from the perusal of their works of classical philosophy, must have been undoubtedly familiar with the highest and noblest displays of human intellect, science, and learning, in every form and grade possible, as well as with the exhibition of human character under every variety of light and shade which could possibly result from the jarring and conflicting influences of principle and passion upon every shade and variety of human temperament and constitution.

These points and arguments we might amply commence illustrating, by referring to the high standard of the master of Grecian verse, and inquire whether any one who has read Horace, can doubt for one moment that he might have written a novel? We must equally suppose that Quintus Horatius Flaccus had uncles, and aunts, and cousins, amongst those very slaves from the midst of whose dregs and degradation his family had so recently emerged. He rose by his own talents from this low state of life to the very highest rank of society. He had seen the lives of mankind and womankind in every class, order, degree, and rank in the community—in the hovel and the cottage—in the hall and the palace, as well as in every medium and intervening kind of human habitation. He had enjoyed the reckless laugh and the *bizarre* humour of inns; and whether he entered fully and deeply into them or not, he had been an eye-witness of all the incidents of a campaign whose annals were most probably of a nature as various and interesting as those belonging either to Culloden, the Peninsula, or Waterloo. He was the companion of

statesmen whose lives, characters, and manners, may have involved as much of the light and shade belonging to them as did those of Olivarez, Pizarro, Buckingham, or Chatham. Nor can we dissent from the supposition that the affections of the Ovids and the Julias had nothing in them affording either entertainment or interest; or, as has been observed, that the author of "Peregrine Pickle" could have supped with Novidienus, and found no use for his tables. The social order and being of the inhabitants of Greece and Rome are pregnant with facts and circumstances which, fragmentary as they may be, are yet sufficient to warrant the assumption, that had such a being as a novelist sprung out of the philosophic and classic characters of those days, the materials which his genius could have raised up were scattered in the greatest profusion around him; and the journey to Brundisium would of itself afford proof enough that the expedition of a Roman Humphrey Clinker might have been. We should be inclined to question much whether the Sabine farmhouse might not have been described as minutely as Pliny's villa, and yet as lightly and elegantly as the pavilions of Lizias; or whether the complete and satisfactory, though untechnical, description of such a scene of refreshing retirement would not have given a great relish of luxurious delight to the reader who, after perusing two controversial volumes on the topography of the *Via Sacra*, had been compelled to feel as though he had, in good earnest,

"Heard the imperial city's din
Beat on his satiate ear."

But that peculiar province of fiction which this class of works may be said to identify itself with and occupy more particularly, demand, in

the exercise of that power which they are supposed to exercise over the mind, an excitement and interest which shall appeal to the darker and deeper shades of human character, as well as to those of a more common and every-day nature. And in pursuance of this argument, as applied to what we have noted above on this subject, it may be stated, that if we look for such dark and enchanting excitements in the classic ages, we shall readily discover that the Jews and Chaldeans, who inhabited, for a long period of the Roman power, the suburbs and outskirts of the imperial city, might have been made quite as imposing, if not more so, than any gipsies, real or romantic, with which our perusals or peregrinations have made us acquainted; or, to come down to a period more nearly approaching to the present day, we can as easily conjecture that the Canidia of the Roman city would have presented as picturesque a full-length as the Meg Merrilies of the Scottish Highlands. As regards that peculiarly-interesting class of outlaws,—to wit, robbers and murderers in their caves,—both Le Sage and Smollett have taken the outline-sketches of some of their best pieces of that sort from Lucian; and we may state, indeed, that both this last writer and the author—whoever he was—who wrote under the name of Petronius, have, in many parts of their writings, approached so closely to the strain and tone of some of our most popular novelists, that we wonder at, scarcely less than we regret, the circumstance of their having mistaken the wide and full career of a path which was so near to them, and which, if they had once hit upon it, they would have found to be most admirably adapted for the display of their peculiar talents.

EPHON.

THE EFFECTS OF HEAT.

IN our former papers we confined ourselves to a consideration of the various modes by which heat is communicated: we now propose to treat of the principal effects produced by such communication; and these we shall find both interesting and important.

Heat regulates, to a very great extent, the dimensions and form of bodies. An increase of heat in a substance is almost uniformly attended with an increase of its size, whilst a diminution of heat is usually accompanied by a corresponding decrease of size. It appears to excite a repulsion between the particles of which the substance is composed, and thus to counteract the forces that hold them together: hence heat, and the principle causing attraction, have properly been represented as two great antagonist powers in nature; the one tending to keep the particles of bodies at a distance from each other, the other to bring them into close contact. We shall speak of this effect of heat, under the term *Expansion*. Again: as

to the influence which heat exerts on the form of bodies, we find that through its agency solids are converted into liquids, and liquids into vapours, and that these three different states are entirely dependent upon its presence; but to this we shall revert hereafter under the heads of *Liquefaction* and *Vaporization*.

EXPANSION.—It may be laid down as a rule, to which only apparent exceptions exist, "that all bodies are expanded by heat, and that the expansion of the same body increases with the quantity of heat which enters it;" but although this is the case, all bodies are not *equally* expanded by heat. This is owing to the varying force of the cohesive attraction to be overcome: for where that force is the greatest, as in solids, expansion is least; whilst liquids or gases, which possess much less cohesive power, are capable of being expanded to a much greater extent.

Many experiments have been undertaken to ascertain the rate of expansion which different

solids undergo from equal additions of heat, as a correct knowledge on this point is capable of considerable practical applications in the arts, especially in the formation of pendulums and balance-wheels. For the results of these experiments, we must refer our readers to the tables given in systematic treatises on heat. It is found, however, that different solids do not expand to the same degree, and that the expansion of the same solid increases as the temperature increases. A body, when heated and allowed to cool, usually recovers its exact original dimensions.

Numerous illustrations might be selected from facts commonly observed by every one, but the following will suffice. We all know how liable glass vessels are to crack from the sudden application of heat to them, and that the thicker they are, the greater the liability. This is owing to the unequal expansion which takes place, for glass being a bad conductor of caloric, one surface becomes heated and expanded before the temperature and dimensions of the other can be increased, and whilst in this state the particles break asunder. This is also the reason why glass mirrors are so frequently broken from a candle being placed too near them.

Wheelwrights take advantage of this property of solids, in expanding when heated, and subsequently contracting as they cool, in the construction of carriage-wheels. The iron rim or tire which they place on the circumference of a wheel is always made too small: they therefore heat it, and, whilst expanded, are enabled to fit it on. As it cools, it contracts, and binds the other parts of the wheel firmly together.

The expansion of liquids by heat is exemplified in the ordinary occurrence of the fluid in a vessel running over if placed on a fire when quite full; and it illustrates also the fact, that liquids expand more than solids; for it is evident, that if the capacity of the containing vessel were increased to the same extent as the bulk of the fluid, no overflow could occur. The dilatation of liquids, also, similarly to that of solids, increases as the temperature increases; that is, a certain quantity of water, at 200 degrees of the thermometer, would expand more than the same quantity at 50 degrees by an equal addition of heat.

Different liquids do not dilate to the same extent from an equal increase of temperature. Those are most expansible which require the lowest temperature to boil them.

Liquids also contract as they cool, in a manner analogous to that of solids. To this, however, there are several remarkable exceptions. Water is one of these. It is found to contract very gradually, as it cools, until it reaches a certain point in the thermometric scale (about 40° Fahrenheit), when it commences expanding, and continues to do so until the temperature is reduced to 32°, when it freezes. This expansion has been ascribed by some to the contraction of the containing vessel; but although this has certainly some share in producing the effect, Dr. Hope has satisfactorily proved that water really experiences an increase of bulk as it cools below 40°. This is a most beautiful provision of a beneficent Creator; for it is owing to this that our lakes, and other pieces of water, are prevented from becoming, during a severe winter, a mass of ice, which the heat of a returning summer would never be sufficient to melt: for were water to observe the ordinary law of contraction, the fluid at the surface of a lake, becoming heavier as it froze, would fall to the bottom, and this process would continue until the whole became solid; whereas, by this bountiful deviation from the law, ice is in fact lighter than water, accumulates on its surface, and thereby greatly protects the remainder from congelation.

The force with which water expands as it freezes is very great. Water-pipes are frequently burst by it. Narrow-necked water-bottles, in our bed-rooms, are often broken during a severe frosty night, if completely filled. And in an experiment performed at Quebec, a bomb-shell was actually burst by the force exerted by this liquid expanding as it congealed.

The expansion of æiform bodies by heat, may be illustrated by inverting a wine-glass on a plate containing a little water, so as to surround the margin of the glass, and at the same time confine the air: if a little warm water is now poured on the plate also, the air in the glass will expand, and a portion of it escape. The dilatation of gases is much greater than that of solids or liquids, owing to their particles being unrestrained by cohesive attraction, and therefore presenting no obstacle to the repulsive power of heat. All gases undergo equal expansions for the same additions of heat. The influence of heat on the atmosphere is one of the principal agents in producing the phenomena of winds.

W. R. W.

THE PLAGUES OF EGYPT.

THE manner in which the divine Head of the Jewish church appealed to the common sense of the Israelites against the idolatry of Egypt, is wonderfully exemplified in the history of the plagues of Egypt. The miracles of Moses had now arrested their attention, and their hopes of

an early deliverance from their bondage must have been proportionably excited. Yet many of the Israelites were still followers of the surrounding idolatry; and the mercy of Providence displayed itself in proving to them the utter worthlessness of all the idols and false gods, on whom

the proud, the learned, and the scientific Egyptians so vainly depended.

The first plague demonstrated the superiority of Jehovah over their imaginary river-gods; the Nile was turned into blood, the object of peculiar abhorrence to the Egyptians. The second effort of power on the part of Moses filled the river with frogs, and its streams by this means became a second time polluted, to the utter confusion both of their Gods and priests. The land also was equally defiled, and they had no way to cleanse themselves, for every stream and every lake was in a state of pollution. The frog was held sacred by the Egyptians, and was regarded as an emblem of preservation in floods and inundations. The plague of lice reproved the absurd superstition which demanded external purity alone. The Egyptians considered it a great profanation of the temple, if they entered it with any animalculæ upon them of this sort. The people in general wore a linen garment over another of linen; but they laid aside the former when they approached their deities, for fear it should harbour vermin; and although their rites were most filthy and contemptible, they were carried on with a most scrupulous show of purity and cleanliness. The fourth plague must have convinced the Egyptians, who were worshippers of Zebub, the gadfly, that their own gods were converted into instruments of torment in the hands of a superior Power. The fifth plague destroyed the living objects of their stupid worship. The sacred bull, the ram, the heifer, and the he-goat, fell dead before their worshippers, as if in ridicule of their vain incense. This judgment must have likewise

had a great effect on the Israelites, and must have tended to wean their affections from those gods of the country, to which they had before attached themselves. The sixth plague was the boil, produced by the ashes of the furnaces in which they had offered human sacrifices, probably some of the Israelites themselves. They were accustomed to scatter the ashes, to obtain a blessing from their gods: this very rite became the means of their present torment. The seventh plague demonstrated that neither Iris, who presided over water, nor Osiris, the lord of fire, were able to protect the fields and the climate of Egypt from the thunder, the rain, and the fire of Jehovah. These phenomena of nature seldom disturbed at any period of the year the climate of Egypt. They now fell at a time when the air was generally most calm and serene. In the eighth plague of locusts, the Egyptians undoubtedly offered up their prayers to Isis and Serapis, who were the conservators of all plenty. They would likewise naturally invoke those deities who were supposed to have power over those destructive creatures. But their very deities could not stand before Moses. The winds they venerated were made the instruments of their destruction; and the sea, which they regarded as their defence against the locusts, could not protect them. An east wind prevailed all that day and all that night: this wind must have brought the locusts from Arabia, and borne them, contrary to their nature, over the Red Sea, which proved no barrier to their progress.—*The Rev. Prebendary Townsend.*

FACTS IN NATURAL HISTORY.

SERPENTS.—In the savannahs of Isacubo, in Guiana, I saw the most wonderful, the most terrible spectacle that can be seen; and although it be not uncommon to the inhabitants, no traveller has ever mentioned it. We were ten men on horseback, two of whom took the lead, in order to sound the passages, whilst I preferred to skirt the great forests. One of the blacks who formed the vanguard, returned full gallop, and called to me, "Here, sir, come and see serpents in a pile." He pointed out to me something elevated in the middle of the savannah or swamp, which appeared like a bundle of arms. One of my company then said, "This is certainly one of the assemblages of serpents, which heap themselves on each other after a violent tempest: I have heard of these, but have never seen any: let us proceed cautiously, and not go too near." When we were within twenty paces of it, the terror of our horses prevented our nearer approach, to which, however, none of us were inclined.

On a sudden, the pyramid mass became agitated! horrible hissings issued from it, thousands of serpents rolled spirally on each other, shot forth out of the circle their hideous heads, presenting their envenomed darts and fiery eyes to us. I own I was one of the first to draw back; but when I saw this formidable phalanx remained at its post, and appeared to be more disposed to defend itself than to attack us, I rode round it, in order to view its order of battle, which faced the

enemy on every side. I then sought what could be the design of this numerous assemblage; and I concluded that this species of serpents dreaded some colossal enemy, which might be the great serpent, or the cayman, and that they reunite themselves, after having seen this enemy, in order to attack or resist him in a mass.—*Humboldt.*

PRINTS OF HUMAN FEET IN ROCKS.—In Schoolcraft's Travels in the Central Portions of the Mississippi Valley, we find the following interesting descriptions of two apparent prints or impressions of the human foot in a tabular mass of limestone at New Harmony, Indiana. The stone had been previously conveyed from the banks of the Mississippi, at St. Louis, and carefully preserved in an open area.

Being aware of the conclusions which must result to geology from a fact of this nature, and that all former notices of the organic impressions of our species in well consolidated strata have been deemed apocryphal, we were induced to examine the subject with particular attention.

The impressions are, to all appearance, like those of a man standing in an erect posture, with the left foot a little advanced, and the heels drawn in. The distance between the heels, by actual measurement, is six and a quarter inches, and between the extremities of the toes, thirteen and a half. But by a close inspection it will be perceived that these are not the impressions of feet

accustomed to the European shoe; the toes being much spread and the foot flattened, in the manner that is observed in persons unaccustomed to the close shoe. The probability, therefore, of their having been imparted by some individual of a race of men who were strangers to the art of tanning skins, and at a period much anterior to that which any traditions of the present race of Indians reaches, derives additional weight from this peculiar shape of the feet.

In other respects the impressions are strikingly natural, exhibiting the muscular marks of the foot with great precision and faithfulness to nature. This circumstance weakens very much the supposition that they may possibly be specimens of antique sculpture, executed by any former race of men inhabiting this continent. Neither history nor tradition has preserved the slightest traces of such a people. For it must be recollected that as yet we have no evidence that the people who erected our stupendous western tumuli, possessed any knowledge of masonry, far less of sculpture, (the carvings of pipe bowls out of straitite, indurated clay, and other soft materials, executed by Indians of the present day, do not, perhaps, merit the name of sculpture,) but even if there is, we believe there is no evidence that this simple art was practised before we made them acquainted with the use of iron; or that they had even invented a chisel, a knife, or an axe, other than those of porphyry, hornstone, or obsidian.

The average length of the human foot in the male subject may perhaps be assumed at ten inches. The length of each foot, in our subject, is ten and a quarter inches; the breadth, taken across the toes, at right angles to the former line, four inches; but the greatest spread of the toes is four and a half inches, which diminishes to two and a half at the heel. Directly before the prints, and approaching within a few inches of the left foot, is a well impressed and deep mark, having some resemblance to a scroll, whose greatest length is two feet seven inches, and greatest breadth twelve and a half inches.

The rock containing these interesting impressions is a compact limestone, of a greyish blue colour. It was originally quarried on the left bank of the Mississippi, at St. Louis, and is a part of the extensive range of calcareous rocks upon which that town is built. Foundations of private dwellings at St. Louis, and the military works erected by the French and Spaniards from this material sixty years ago, are still as solid and unbroken as when first laid.

ANAL.—A gentleman of unimpeached veracity remarked to us, says a writer in the "Scientific Tracts," the other day, that while in the island of St. Croix, he instituted several experiments with reference to ascertaining the truth of what he had been often told, of the ingenuity and apparent reasonings of the ant of that beautiful island. Having slain a centipede, which had been sent him by a friend, he laid it on the window-stool within his department, where, though not a single individual of that mischievous race of vermin had been seen, to his great gratification, in the course of a few hours, one solitary ant suddenly made his appearance through a crevice in the casing, attracted probably by the odour of the dead body. Shortly after, having surveyed the premises, it disappeared, but speedily returned with a host of companions, to whom the discovery of the prize had unquestionably been communicated. A more careful survey of the magnitude of the object was evidently instituted. The whole company then disappeared simultaneously through the crack; but an army was put in requisition, for the third appearance was a multitude. Having mounted the carcase, examined minutely its exact position, and satisfied themselves that it was actually bereft of life,

and that no danger would be incurred from their premeditated operations, a new and unlooked for series of labours were commenced, bearing such a striking analogy to human reason, as manifested in what is commonly called contrivance, that if there is no intelligence in it, why, the metaphysicians have in reservation an unexplored field of observation. Well, not being able to move the mass entire, they divided themselves into platoons, and cut the body into portions of about half an inch in length; which was effectually and skilfully done, between a late hour in the afternoon, and the following night, and each piece transferred to their citadel, through some contiguous aperture of sufficient diameter to allow the loads to pass. When the observer arose at daylight, every part had been carried away but the head, which was really moving off toward the hole, surrounded by an immense concourse of admiring spectators, probably on the *qui vive*, happy in the delightful anticipation of future feasts and revellings. On further scrutiny, he found that the decapitated head was mounted on the backs of about a dozen bearers, who, like a Roman phalanx with a testudo upon their shoulders, were marching off in an orderly manner, toward the same orifice through which all the rest had disappeared.

GROWTH OF FISH.—The rapid growth of some fish is very extraordinary. I saw three pike taken out of a pond in Staffordshire, belonging to the present Sir Jervoise Clark Jervoise, two of which weighed thirty-six pounds each, and the other thirty-five pounds. The pond was fished every seven years, and supposing that store pike of six or seven pounds weight were left in it, the growth of the pike in question must have been at the rate of at least four pounds a year. Salmon, however, grow much faster. It is now ascertained that grilse, or young salmon, of from two and a half to three pounds weight, have been sent to the London markets in the month of May, the spawn from which they come having only been deposited in the preceding October or November, and the ova taking three months of the time to quicken. It has also been ascertained by experiment that a grilse which weighed six pounds in February, after spawning has, on its return from the sea in September, weighed thirteen pounds; and a salmon fry of April will in June weigh four pounds, and in August six pounds.—*Gleanings of Natural History.*

FOSSIL REMAINS OF THE ELEPHANT.—In a pamphlet published at Sydney, New South Wales, by the Rev. J. D. Lang, detailing the steps which had been taken for the establishment of an Academic Institution or College, in that colony, we find the following curious statement:—"A collection of fossil bones which had been discovered in a lime-stone cave at Wellington Valley, by George Rankin, Esq. of Bathurst, and to the discovery of which the writer had the honour of calling the attention of the colonial public, in an anonymous letter published in the "Sydney Gazette," about eighteen months ago, was entrusted to the writer by Mr. Rankin, for Professor Jameson, of the University of Edinburgh. One of the bones had evidently belonged to some large animal; and Professor Jameson and an eminent naturalist of the College of Surgeons in London, to whom it had afterwards been forwarded, coincided in regarding it as a bone of the hippopotamus. Not satisfied, however, with their own opinion concerning it, it was subsequently sent to M. Le Baron Cuvier of Paris; and that distinguished naturalist (Professor Jameson informed the writer just before leaving Scotland) had ascertained that it was the thigh-bone of a young elephant; thereby establishing the interesting and important fact, that the wilds of Australia were once traversed by that enormous quadruped."

THE DAY OF THE MEN, IN THE SCOTTISH CHURCH.

THE day of the men—*la nan daorna*, as it is called in the Gaelic language—is not an observance which is enjoined by the formulary of the Scottish Kirk; neither is it common to Scotland, or, indeed, known at all in the more populous or wealthy parts of the country; it is, in a great measure, confined to the counties of Inverness, and Ross, and Cromarty, which is spotted like a piece of patchwork over the latter. Easter Ross, which is in great part both fertile and populous, may be considered as its head-quarters, and it has probably spread thence into all the districts which it has penetrated.

The people of Easter Ross have long been remarkable for strong attachment to the Presbyterian doctrines, sturdy disputants upon doctrinal points, and equally given to the polemics and the practical exercises of their religion. One cause is usually assigned for this, namely, the number of Monroes, and other clansmen from that part of the country, who joined the armies of Gustavus of Sweden, the lion of the north, when he was battling in Germany, as the champion of the Reformation. A good many of these found their way back to their native country, and are understood to have imported a spirit of zeal on religious subjects, which has not abated even at the present day. That such is the fact is probable; but be it as it may, the district to which we have alluded is the one in which the day of the men is considered as a very important and highly essential part of the sacred observances of the year.

Every one who knows any thing about the practice of the Kirk of Scotland, must be aware that the sacrament of the Supper is dispensed only once a year in country parishes, and rarely more than twice in towns. The time for dispensing it has reference to nothing commemorated in the calendar, but is chosen when the weather is most likely to be good, and the labours of the people are not pressing. In towns these are less attended to, but in the country the celebration never takes place in seedtime or in harvest, but generally during that portion of the summer when nature is bringing forward the fruits of the earth with the least assistance of human labour. At this particular season the weather is generally settled, the nights are short, and, in the northern parts, there is pretty bright twilight all night long. These circumstances enable parties who are so inclined, to travel twenty or thirty miles, or even more, in order to be present at the sacrament. Thus there are very often gatherings of the people far more numerous than one would suppose, in a country so thinly peopled in proportion to its extent. In the south, the gatherings are not generally so numerous, but they are considerable in some places.

The regulations of the Kirk enjoin public worship for four days: First, upon the Thursday, which is considered to be a day of fasting and humiliation, ordered to be kept as a Sabbath, and having the same extent and form of service in the church; secondly, the Saturday, which is considered as a day of preparation, but not kept as a Sabbath. The service is not begun till after the noon of this day, and the people are not enjoined to abstain from their ordinary labours any longer than the service lasts. Thirdly: the Sunday, which is the day of communicating, and by far the most solemn day of the whole; and, fourthly, the Monday, which is a day of thanksgiving, with morning service only, after which the people are supposed to return to their ordinary employments, or to meet with their friends, and commune respecting what they have heard. It will be seen that, in this arrangement, Friday is a blank day, upon which there is no public worship, though, in some parishes, the young, and especially those who are to communicate for the first time, assemble in the church, and are examined as to their religious knowledge, and admonished with respect to their general, and especially their religious, conduct. This, however, is not very common; and as the Friday is one day only, and regular employment cannot be very profitably resumed upon it, some spend it in idleness, and some in dissipation.

Friday is "the day of the men" in all parts of the country where such a day is kept, and it is a day of very peculiar and often very interesting character. It is usually the longest single sederunt on the whole occasion; and there is often a vast deal of knowledge of the Scriptures and acumen displayed at it. The men consist not only of the seniors of the parish, but of many who come from a distance to take a part in the business of the day. These consist of catechists, or men who are appointed to look after the religious knowledge of districts where the parish is too extensive for being perambulated by the minister, or when the state of the season renders such perambulation unnecessary; and along with them there are many others who are eminent for their religious knowledge, and not willing that it should be hidden.

It sometimes happens that these *men* are unable to read, or even to speak the English language; but they all have a great deal of theological knowledge, and their acuteness shows that they are not men of mere rote, but that they have thought deeply upon all the subjects upon which they speak. The greater number of them, too, speak very fluently, more especially those who speak in Gaelic; and they almost all have what is called a "gift of prayer," that is, they can pray a long time extempore, without pause or hesitation. The Gaelic is well adapted for this purpose,

because its whole structure is poetical, and many of its figures are lofty and impressive. It also harmonizes well with the phraseology of the Bible, with which it is copiously mixed. It may be that some of these men attend such meetings, partly through desire of showing off their knowledge, for it is difficult to find any human exhibition without some of the leaven of human vanity in it: but there is an earnestness and sincerity of manner about a vast majority of them which no hypocrite could possibly assume. Our present business, however, is description, and not criticism, though we feel quite sure that the men would have little to fear from the latter.

They meet in the church at rather an early hour on the Friday, and many are in waiting before the doors are open; and when this takes place, the church is soon filled by a miscellaneous assemblage of speakers and hearers. The parish minister himself presides, but he occupies the precentor's desk and not the pulpit; and those ministers who are to assist him on the other days, usually mingle with the congregation, apart from each other, as is also the case with the principal speakers among the men. A psalm and prayer always begin the day, and with the latter the official duty of the minister closes, and the men take up their subjects, state their opinions, their doubts, and their perplexities; and always, now and then, interpose a prayer. The subjects are for the most part doctrinal, often involving the most nice and intricate points; but it is astonishing with what acumen the more experienced manage these. There are very many professional ministers, where religious discussions are not common, and who consequently get every thing their own way without contradiction, who would find the men most formidable antagonists. This, indeed, sometimes happens to the minister of a parish, especially if he is a young one, and has been appointed contrary to the wishes of his people. This occasionally happens, and when it does, the men, who generally have a very strong feeling for each other, muster from all quarters, ready prepared on all the difficult points, and work him without mercy. They are enabled to do this in consequence of the position which he occupies on the occasion. We have mentioned that he presides, and that after he has read the psalm, and offered up the prayer in the morning, his formal duty is at an end, until a prayer and psalm again close the day. But

although, during the intermediate part, the employment of the men is out of his direction, he is by no means out of the power of the men. Whenever a difficulty arises which they cannot solve, or do not choose to solve, an appeal lies to the parish minister, who is understood to be both able and willing to help them out of every difficulty: if he is disliked, as we have stated, they weigh him in the balance to the nicest scruple; and he must be an acute man indeed, if he is not found wanting in some particulars. If he is a favourite they let him alone, and discuss their knotty points with each other; though, in these cases, he often strikes in of his own accord, and gently brings them back when they are getting beyond their depth.

To make a figure on the day of the men is a matter of considerable emulation; and therefore there are always a certain number of novices, catechumens, who make their appearance on every such occasion. These, generally speaking, have been under the training of some catechist, and have been tutored on the subjects of their first displays. They usually begin in a louder tone than the men of experience, but they fall off by degrees, and many of them break down so completely as to be incapable of rallying again: these are cases in which the parish minister is understood to interfere, and give encouragement and assistance; and if this fail, some one stands up to pray, and after prayer a new subject is taken up by a new speaker.

This may seem a singular mode of procedure to those who are not accustomed to it, or the character of the people among whom it obtains; but, notwithstanding this, it is a scene of much instruction, and appears to have no small influence in preserving the zeal for religion, and the consequent uprightness of conduct, for which those shrewd, but sober and simple-minded people are so very remarkable. Scattered widely apart from each, cut off from intercourse for a considerable portion of the year, strangers to what the inhabitants of more wealthy places call the comforts of life, and without any amusements within their reach, religion is to them all in all. It is blended with their every day occupations; it is their resource in the hours of relaxation; it is their consolation under privation and pain; and it is their hope and stay on the bed of death: and, we may add, that the "day of the men" tends much to keep it alive.

LIQUEFACTION AND VAPORIZATION OF HEAT.

It was remarked in the last paper, in allusion to the influence that heat exerts on the form of bodies, that by its agency solids may be converted into liquids, and liquids into vapours; not only so, but, by the abstraction of heat, vapours

may be again condensed into liquids, and these also into solids; and so universally does this apply, that the common opinion entertained with regard to the three different conditions under which matter exists on the globe, is, that each of

them is owing to the relative preponderance of the powers of attraction and repulsion; the latter being manifestly owing to the agency of heat. Thus it is supposed that in solids the attractive power is greatest, in liquids the two forces are nearly equal, whilst in æiform bodies repulsion is considered to predominate.

The temperature at which solids liquefy is called their melting point, or point of fusion; that at which liquids solidify, their freezing point, or point of congelation. These points vary in different substances, but are uniform for the same substance under similar circumstances. The freezing point of water is at 32° of Fahrenheit's thermometer, which, of course, corresponds also to the melting point of ice.

One of the most important discoveries connected with the liquefaction of bodies, and which was made by Dr. Black, is, that during the process a large quantity of heat is absorbed by the body as it dissolves, and becomes concealed in it, that is, becomes insensible to the thermometer; and the same obtains, also, during the conversion of liquids into vapours. Hence Dr. Black called it concealed, or latent heat. The quantity of heat which is thus rendered latent, as a body becomes fluid, varies in different substances. Thus ice, as it melts, absorbs a quantity of heat sufficient to raise an equal weight of water 140° , whilst, during the fusion of tin, 500° are stated to disappear. It was proved, also, that during the freezing of liquids, a quantity of heat is set free corresponding to the quantity absorbed during liquefaction. And here, again, we have further demonstration of the wisdom and goodness of God; for had not the melting of ice or snow been thus rendered gradual by the large proportion of heat necessary to be absorbed, the slightest increase in the temperature of the atmosphere would suffice to thaw the heaviest fall of snow, and our lands would be devastated by sudden and extensive inundations.

The loss of sensible heat during liquefaction, is the basis of many of our processes for producing cold, as by freezing mixtures, &c.

VAPORIZATION.—This process takes place in two different ways: either rapidly, and attended with considerable commotion in the vaporizing liquid, when it is called "ebullition;" or slowly, and almost insensibly, when the term "evaporation" is applied to it.

It will be convenient to treat of each of these separately.

Ebullition.—The temperature at which vaporization takes place so rapidly as to constitute ebullition, is called the boiling point. This point varies in different fluids, that of water being 212° , whilst that of mercury is 662° ; but is constant in the same fluid, the circumstances being the same. The nature of the vessel has a slight influence on the boiling point: thus, water boils at a temperature two degrees lower in a metallic

vessel than in one of glass. Pressure affects, very considerably, the degree at which liquids boil: at the top of a mountain less heat is required to boil them than at the foot, owing to the diminished atmospheric pressure; and in a vacuum, the heat of the hand will suffice to boil water. But if subjected to a greater pressure, by confining it in a vessel, the boiling point is considerably raised; and it has even been conjectured, that if a vessel could be procured strong enough to resist the expansive force of the steam, water might be made red-hot. When a liquid has reached its boiling point, its temperature no longer continues to increase, although the application of heat to it is continued; nor does the temperature of the vapour rise higher than that of the liquid that produces it. From these and other facts, Dr. Black was led to suppose that the heat which is imparted to a liquid after it has arrived at the boiling point, becomes latent during its conversion into vapour, and this he afterwards proved by experiment. It was found, also, that the heat thus rendered latent was again set free when the vapour was condensed into the state of liquid. The quantity of heat thus absorbed by water, as it is converted into steam, would be sufficient to raise the temperature of an equal weight of that liquid nearly 1000° . These laws have been beautifully applied to the construction of the steam-engine, for an account of which we would refer our readers to Dr. Lardner's interesting work on the steam-engine.

Evaporation is constantly going on at the ordinary temperatures of the atmosphere. This occurs in all fluids, to a greater or less extent, and even in some solids, as camphor. It is most rapid in those liquids the boiling point of which is lowest.

A large quantity of heat becomes latent during evaporation, and hence considerable cold is produced. This may be illustrated by allowing a few drops of spirit of wine to evaporate on the hand. It is on this account that showers in summer are so refreshing, from the water absorbing, as it evaporates, the superfluous heat from the earth. Porous earthenware wine-coolers act on this principle: being dipped in water, they imbibe a certain quantity of it, which gradually evaporates, and, in doing so, abstracts heat from the bottle of wine placed in the cooler.

The process of distillation, for the purpose of separating spirit from fermented liquors, depends on evaporation. Alcohol or spirit of wine rises in vapour at a lower temperature than the water and other ingredients with which it may be mixed; it is therefore easily separable from them by heat; and being separated, is carried along a tube passing through cold water, by which it is condensed, and obtained in a less adulterated state. Evaporation is constantly going on from every piece of water on the surface of the earth; the vapour thus formed accumulates in the atmo-

sphere, and, under certain circumstances, again returns, the bearer of innumerable blessings,—at one time in the meek and lowly transparency of the dewdrop, at another in the sparkling brilliancy of hoar-frost; now it clothes the earth in the

radiant purity of the snow, now visits it in vernal showers, and traverses its bosom in a thousand rippling rills, whispering their simple songs of gratitude and praise.

W. R. W.

TALES OF THE INN KITCHEN.—No. II.

THE interest excited by the narrative of "The Gamekeeper's Daughter," told, as it was, with much feeling, could not but be very great. After awhile, however, when inquiries had been answered, and kind expressions had been interchanged, a second gentleman was called on for his tale, and he begged to place before them an account of

THE BECALMED SHIP.

Not a breath of wind had been stirring all day; the flag that was attached to the foremast-head hung listlessly by its side, while a burning sun poured down unremittingly his fiercest rays upon ocean and land. All on shore was perfectly still; not a sound indicative of labour was heard, even from the neighbouring plantation, so intense was the heat that had reigned throughout the day. The sailors on board the brig had been lying under an awning that was stretched upon deck, and, overcome by the sultriness of the air, had resigned themselves to sleep, from which the voice of the captain awakened them, as soon as he perceived the first motion of the streamer that gently moved when the first breath of the land breeze sighed around it. Roused from their slumbers, they proceeded to get the vessel under way; and as the last glimmering of the sun was seen through the trees that bordered the plantation of the principal man in the place, and the first signs of returning life and activity were perceptible on the shore, the shout of the sailors announced to the passengers below that they had taken their departure from the island of Antigua.

Among those who had shipped themselves for England were two gentlemen and their ladies, one of whom was accompanied by a younger sister, and the other with two lovely children. These, with four servants, three natives of Scotland, the captain and crew, made the whole number of souls on board the Harriet amount to twenty-one, for whom provisions for fifty-five days had been taken in. Their progress was very slow for the first four weeks, and the end of the sixth found them in the midst of the mighty Atlantic. The captain was constrained immediately to put both men and passengers upon short allowance. In the examination of their stores, they were full of consternation at the discovery that the sea had destroyed one barrel of biscuits, and that the requisite quantity of meat had not been stowed in the vessel previously to her departure from the island. Mutual reproaches and recrimination were then indulged, but soon

gave way to the anxious consideration of what, in such an emergency, was the best conduct to adopt. A still less allowance was given to each individual, both among passengers and sailors; and a hope was entertained by the captain that, before all their provisions were exhausted, some vessel would appear, from which a supply of necessaries might be obtained.

Three days after the passengers and crew had agreed to the diminution of their daily food, the slight breezes that had wafted them along gradually subsided into a perfect calm. Not a breath stirred the bosom of the mighty ocean, as it lay glittering in the sunbeams that lighted the waters many fathoms below the surface, and not a cloud hung beneath the blue heavens as the sun journeyed in his course, until he bathed his radiant forehead in the western waves. The ship lay motionless on the sea, as if spell-bound by the spirits of the deep; and so intense was the heat, that the few who came on deck found it painful to walk; it was as if burning embers had been scattered around: the pitch exuded from the interstices of the planks, and the iron stanchions seemed as if they had been exposed to the action of a slow fire. Heavily wore the hours of that day, and the anticipation of such another filled all on board with trembling dread. The supply of water, as well as the other provisions, was rapidly diminishing, although both were portioned out in small quantities; so that unless the wind should again rise, and that speedily, there would be no deliverance from an awful and terrible death. As the daylight departed, and the sky became brilliant with a thousand stars, a few of the passengers left their cabins to walk on deck. One of the married ladies brought her eldest child, a boy of four years of age, who, during the early part of the voyage, had been the pet of the sailors, who loved to listen to his engaging prattle, and to play with him in his little games, as his laughing glee often reminded them of those they had left in their own loved land, to whom they were then returning. About the time the captain had been under the necessity of shortening the daily allowance of provisions, the little fellow became ill, and called forth all the solicitous attentions of his parents for his recovery. A burning fever had seized him, and those who watched over him took most of the water which had been apportioned out to them to moisten the lips of the little sufferer. At first he seemed to revive, and for two or three

days very sanguine hopes were entertained of his recovery. On the first evening the ship was becalmed they brought him on deck, and hoped that a change from the almost intolerable temperature of their cabin would greatly restore him; and such, for a short time, appeared to be the case.

The night passed away, and the sun arose with new strength from his slumbers. Under any other circumstances, the surpassing splendour of such a scene would have awakened their greatest admiration and delight. From north to south the waters were streaked with lines of silver, glittering with beauty and brightness. A few fairy clouds that hung in the orient sky parted as the sun rose from the deep, and seemed like drapery drawn, by the unseen hours, from the couch where the rosy-fingered morn had been reposing. It was a gorgeous sight, as, "with new-spangled ore, the sun flamed in the forehead of the sky;" but the eyes that gazed upon him were heavy with grief and dismay, for no breeze as yet had arisen. In vain did they loosen the sails; no wished-for gale filled them. They cast on each other a fearful glance, and shuddered at the fate that seemed about to befall them.

Another day passed as the preceding; the ship still remained motionless, the heat was as oppressive, and the hearts of some began to faint. The sick child, having relapsed into a more dangerous state, demanded and received the utmost attention. As the mother bent over him, she seemed to forget her own increasing weakness: he was her first-born, and with the affection a mother only feels and manifests, she sat by his side throughout the day, and, with her own hand, cooled his parched lips, when his eye, meeting hers, indicated the wish he was not able to utter. When the next night drew on, her anxiety and her solicitude were increased, for the younger child became restless and fretful, and it was soon apparent that fever had seized him too. Her husband, with an aching heart, assisted her in attending to their little ones, and marked, with the deepest agony, that she herself was sinking through want of repose. But all his solicitations that she would, if only for a short time, leave the couch of her children, and endeavour to obtain the refreshment of sleep, were in vain, he could not prevail upon her to relinquish her office, or withdraw her attention, for one hour, from the exercise of her maternal duties. They watched the livelong night, and the morning still found them, sleepless and pale, by the side of their offspring. Both the invalids were worse, and it was evident to the parents that the sufferings of the elder would soon be terminated: his breathing became more difficult, and his strength was hourly failing.

On this, the third day of the calm, two others of the passengers—the sister of the married lady and one of the Scotchmen, who had been an overseer in a plantation on the island whence the

vessel had sailed—fell ill. The scanty supply of food, and the small quantity of water that was allotted to each, had impaired their strength; and the attention of their respective friends was called into requisition on their behalf. It was evident to all that three more such days could not be endured. There remained in the cask but barely sufficient water for that day and the next, and the last biscuit had been divided between them; so that if no change of weather took place, there would be no alternative but to resign themselves to their fate. Loud was the groan of anguish with which this announcement was received, and as thoughts of their homes and friends rushed over the minds of all, they wrung their hands, and wept in the wildness and bitterness of despair.

Some were young, and were following relatives who, on the preceding year, had embarked for England, and were awaiting in eager expectation for their arrival. Of this class were the lady and gentleman whose sister had sunk beneath the privations of the voyage. Her tale was pitifully sad: she had been betrothed in early life to a young Englishman, who, with his parents, had resided for some years in the island of Antigua, and had returned to his native land to enter upon the possession of an estate which had unexpectedly reverted to his family. Returning, when his affairs had been adjusted, to claim his affianced bride, he was lost on the passage; and thus her fondest hopes were blasted, and all her anticipations of future happiness destroyed. The death of her own parents, and the subsequent removal of two of her sisters to England, made her determine to visit that country with the remaining one, whom she now accompanied on the voyage. She anticipated a mournful pleasure in beholding that land of which, from her earliest childhood, she had heard so much; which had a double charm when remembered as the birthplace of him who had won her affections, and who had often wiled away the hours by his glowing description of the valleys, the hills, the cities, and the villages of his native land, to which he hoped, at no distant period, to lead her, as the wife of his youth. A pleasant, delicious dream! but one that he never realised. She lay in her cabin feeble and helpless, watched by the eye of her weeping sister, who endeavoured, with a mother's fondness, to anticipate her wants, and, with ready hand, to supply them. Round her neck hung a gold chain, to which was attached a miniature portrait of her lover, who, in the last moments of parting, had placed it there, that, by the possession of the semblance of his features, she might, as she gazed, feel less bitterly the pain of his absence. This she pressed with one hand to her heart, while the other was locked in her sister's.

"Maria," said the invalid, "I thought not, when I heard poor Henry had perished in the

waters, that I should find a resting-place in the depths of the ocean too."

"O, do not talk so sadly," replied her sister, "you will yet recover; another day, and the wind may rise, and we shall be able to pursue our voyage, and meet with another vessel, from which we may obtain the necessaries your feeble condition demands."

"I shall never be restored again," said the sufferer; "even if your hopes be realised, sorrow has pressed too heavily here;" and she laid her hand to her heart—and continued—"I am willing to die; life, since that fatal night when, through the wild roaring of the waves and the hollow murmurs of the storm, the cry of distress rose unheeded,—has had no charms for me. There was something in the prospect of visiting England which seemed to promise a little alleviation of my sorrow; but that country I shall never see. Do not take his portrait from me when I am dead, Maria; promise me you will not. Let it be buried with me in the sea."

"Do not give way to such gloomy thoughts, my dearest Emily," said her sister, "we are not without hope that a change in the weather will speedily take place, and we shall then be delivered from our present fears." But as she spoke, and tried to re-assure the fainting spirit of her sister, she could not take the same comfort to herself. The fear of a lingering death had seized all; and the dreadful intelligence that the last division of biscuits and water had been made, was only kept from the knowledge of the sinking invalid by her sister sharing her own supply of the latter with her.

As the third night set in, the elder child, who had been first seized by the fever, died. Agonizing was the grief of the bereaved mother, as she hung over the inanimate remains of her first-born, and long and bitter was the cry that her anguished spirit sent forth, as her husband tore her away from the couch on which her boy was laid in his still and unawaking slumber. That was a fearful night to all; not a single article of food remained, the water casks had been emptied, and a horrible fate awaited all, unless timely assistance should be afforded.

As the morning again broke on the waters, it was a fearful sight to see all in the ship who were able to come on deck, turn from their long and anxious gaze over the wide waste before them, and look with speechless agony in the face of each other. No help appeared nigh, and their parched lips quivered with fear and dismay. Alone there on the pathless sea—far, very far from any land—with the unclouded sun shining as if in mockery over them, and the waves glittering in beauty around—the vessel remained another day immovable. Some, in the wildness of despair, had laid themselves down to die, and, closing their eyes, awaited the stroke that should release them from their misery. Others, unwill-

ling to part with hope, remained gazing on the heavens, eager to catch the least indication of wind, and throwing up small pieces of paper, to see if a breath was stirring. But in vain: another dreadful night came on, with its dreary stillness. Scarcely a sound was heard throughout the ship, save the stifled groan of one of the passengers or crew; for, habituated as the latter had been to all the hardships of a nautical life, they now began to sink under their terrible calamity. The captain—comparatively a young man—who, leaving England as mate, had succeeded to the command of the vessel on the sudden death of the first officer at Antigua, was one of the first who resigned himself to despair. "I felt," said he, when narrating the circumstances to me, "that it was in vain to resist what appeared inevitable: I laid myself down in my cabin, committed my soul to God, and prayed to die."

On the fifth morning, a slight breeze stirred slowly the long steamer that hung idly so long at the mast head; and with their remaining strength, some of the crew endeavoured to prepare all the sails, that so favourable and long-desired an opportunity for removing from the spot where, as if held by enchantment, they had been detained for the last five days, might not be lost. But the men, reduced to the helplessness of children, by the want of the most common necessities of life, were unable to accomplish their object. They had not tasted food for two days; and now that the wind had arisen, only two of the sails were in a condition to receive it. Slowly, however, the vessel began to move, and a faint gleam of hope animated its crew that, during the day, they might fall in with some ship, and thus be rescued from their perilous condition.

The day wore away, and the vessel being half trimmed, proceeded but slowly. As the shadows of evening began to fall, the hearts of the men again sank within them, for they knew they could not endure another day the privations and pangs of hunger with which they were seized. As three of the crew were lying near to the stern wheel, one of them whispered to his next comrade, and as he spoke, both raised themselves on their arms, and the fire flashed from their eyes.

"We must do that or perish, Jacques," said he who first spoke; but he who was addressed turned away from his companion with a kind of loathsome horror, at the proposition he had made.

"I will perish before I do it," replied Jacques. "What! the child? Never ask me the question again."

"What, shall we not do it to save ourselves?" said the first speaker; "others have done so before us; and on the preservation of our lives depends the happiness of others we have left far away."

As he spoke he rose and staggered towards the door of the cabin in which were the lady, her husband, and children. His companion followed him with his eyes. The last words he uttered had called up a thousand feelings in his breast; and the desire of life, even if purchased in a manner at which he shuddered, was excited within him. A gentle tap at the cabin door was answered by a feeble voice bidding the visitant enter. The sailor stepped into the room, and signified to the parents that it would be well if the child who lay dead were removed from their sight; and that he would perform the melancholy duty of committing to the waves the remains of one who had endeared himself to all on board. The father looked at the mother of his child; and while she gazed for a moment on the sailor, as if to comprehend the true nature of his request, a sudden thought struck her, and she peremptorily refused to accede to it. "Not to-night," said she, "to-morrow will be time enough; no, not to-night;" and she hid her face and wept.

The sailor returned on deck, muttering between his teeth, and lay down once more beside his comrades, whose quick and fast breathing told him their end was approaching.

The next morning, which was the sixth from the commencement of the calm, as the sailor Jacques lifted his languid head from the deck, he thought he perceived a sail at no great distance. His strength seemed to return as, with an exclamation of delight, he roused those near him to look in the direction in which the ship had appeared to him, fearing lest his own eyes should have deceived him. A joyful cry rose from their lips, as they saw approaching them a large West Indian vessel, with all her canvass stretched. They watched her with trembling anxiety, and when, once or twice, she seemed bearing to the south, they hoisted signals of distress, which they soon perceived were observed, for she quickly bore down upon the Harriet, and proved to be the Alert, a Jamaica trader. A few words sufficed to explain their sad and doleful condition, and the captain of the Alert immediately went on board the ill-fated vessel, taking with him such necessaries and restoratives as his own ship supplied. The dangerous state of the young lady before mentioned demanded his first care, and he soon perceived she was rapidly sinking. Administering what temporary aid he was able, he visited each of the other passengers and the crew, in succession. He found the parents of the dead child sitting near his remains; and gently adverting to the prudence and the necessity of having him removed, he obtained permission to send his own carpenter to construct a coffin for him. That day, at noon, he was buried. As the mother, who insisted on being upon deck during the ceremony, saw the waters close over

her child, she gave one wild shriek, and sunk into insensibility. But another trial yet awaited her: her infant who had sickened on the second day of the calm, died that same evening. Poor thing! she mourned like Rachel for her children, and would not be comforted because they were not. She lived to reach England, but never recovered from the effects of that voyage.

For two or three days after the Alert had come up with the Harriet, the young lady who appeared near death when the captain of the former vessel visited her, seemed to revive, and sanguine hopes were entertained that she would recover; but the hectic flush that sat upon her cheek was delusive, and, as the torch sends forth a brighter blaze when it is about to expire, so her beauty appeared the more brilliant a short time previous to her dissolution. The Alert parted company with the Harriet when nearing the Channel, after having supplied the latter ship with provisions for a week.

It was on a clear and beautiful evening that the shout of the sailors on deck announced to the passengers in the cabin that the English shore was visible. Emily Dalmer listened to the exclamation of joy, and her countenance seemed suddenly irradiated.

"Take me, William," said she to her brother, "take me above; let me see that land, though it be afar off."

Her brother complied; and as she sat on the deck, and the gentle breeze that was wafting them along sighed through her dark hair, she gazed long and wistfully at the broken shore, towards which they were rapidly approaching. The sailors were ascending the shrouds to catch a better view of that welcome land; and their loud congratulations and boisterous mirth strangely contrasted with the silence of the little group that had gathered round the invalid. Her head had sunk on the shoulder of her sister, and she appeared overcome by the emotions which had been excited by the sight of that country with which some of her brightest and holiest hopes had been associated. As she remained in this position for some time, her sister attempted gently to rouse her, and softly recovering her arm from beneath the head of the lovely sufferer, parted the curls that had fallen over her face, and kissed her pale lips with the fondest affection. There was no pressure in return; and after her sister looked again on the features before her, she saw that the spirit had fled.

She lies in a beautiful and romantic churchyard on the coast of Devon, with this simple inscription on her tomb:—"Emily Dalmer, aged 24. A stranger in a strange land."

All the other passengers recovered from the effects of their hazardous voyage; and the Harriet still sails in the track she formerly pursued.

MEDICAL THEORIES.

SECOND ARTICLE.

THE French are amongst the vainest medical theorists of the present day and generation, but we do not contend that for this especial reason they are entitled to erect themselves into a medical autocracy, and assume the sway of universal critics, and dictators in the science of medicine. We must, however, on this, as on all other subjects, allow something for truth, and a good deal for vanity. By changing the chemical nomenclature, chemistry became the French chemistry; works of Gretry and Sachini and Cherubini constitute French music; the Paris Basia, and Monsieur Brongniart's barbarous nomenclature of rocks, have nearly put Dr. Buckland out of the field, and made geology the science of France alone. Dancing, dressing, capering, and cookery, we admit are theirs, without any other competitors in the universe. Every body allows them to be the best soldiers except the Duke of Wellington, and all except Mr. Seppings consider that they build the best men-of-war,—all except those who have travelled over them think that they have made the best roads; and our ladies' shoes must all be made in Paris; our dandy's gloves must come from the same mart; and in diseases, Monsieur Broussais reigns lord king paramount; he is, forsooth, to rule all stomachs, livers, bowels, lungs, and limbs, with bouillons, ptisans, and saignées. There is but one nation, and that is France—but one town, and that is Paris.

The French medical theorists believe very little more in the existence of gout than they do of the man in the moon. In England the word gout is a charmed word,—it is both cabalistic and surgical. It saves all trouble, care, and anxiety to the physician, and, by a necromantic transference or twist, it gives it all to the patient, with all full interest of pain and suffering included. No matter what the pain or the disease may be, or where it may take up its local habitation, only let the patient be sick and past forty, let him drink a bottle of champagne daily, and eat devilled turkey and pickled spinage about this time of the year, and a Hottentot would tell him he had the gout. The head, the heart, the stomach, the liver, the spleen, the nose or the great toe—be it dropsy, palsy, consumption, asthma, apoplexy, it is all resolved into the same pristine element of disease—the gout. It is as royal a road to physic as to death. If you are anxious for either, you cannot take a safer route. Catch the gout, and be well assured that it is of a good kind, and all your anxieties will be eased, all your profoundest wishes accomplished.

In the earlier days of our youth, when we were more prone and partial than our present advancing age will permit us to be, to doubtful theories and speculative sophistries, it often occur-

red to us as matter worthy of some doubt whether the lancet or the cannon-ball were the most dangerous instrument when wielded by a stupid surgeon, or fired off by a crazy artilleryman. The former of these possessed indeed the twin-power of doing often as much harm in the practitioner's pocket as in his hand. The internal theory of disease, of which some drowsy Scotch student has just obtained a sufficient insight to put his knowledge and his ignorance on a par, will teach him, if not in due time enlightened by wisdom, or darkened by death, to bleed one patient in a fever to death, and to inebriate the other with huge potations of port wine, sufficient either to drown himself, or to swallow up all the Temperance Societies in the United Kingdom in one wide, universal deluge. It has therefore become in our minds the food of much knowledge, and much experience and information have we gleaned from gathering the wheat and wisdom of our present age from the wild tares of delusion and deception on this subject, in which we rioted in the early days of youth and inexperience. We formerly looked upon the wisdom of the world as something very nearly approaching to the nature of an apocryphal revelation, but we now revere the dictum of the great universe as the voice and wisdom of a vast and unseen Spirit, who, by his eternal will and power, guides us in this world through paths of everlasting and radiant sunshine to the homes and abodes of true and everlasting happiness.

We have ceased to wonder at the knowledge which seems inherent in the brain of every sick man in the present day; we do not consider it for one moment as an equivocal mark of insane delirium, or as the result of an overburdened or overweakened intellect, struggling in the strangling depths of agonising disease to recover its lost power and potential influence over the distorted faculties of the mind. We now bend down our grey hairs in obedient attention to every word the suffering patient utters, and we do not pause in marvellous astonishment when we are informed by the sick man, that, with all his respect and esteem for our private character and worth, he cannot forego the impression that the art we practise and the profession we follow in public, are each of them made up of the same quantum of illusive and conjectural absurdities, and that, in our treatment of disease and suffering agony, we may be, in spite of ourselves, as much guided by the blind phantom tricks of fashion, as by the stern and just laws of true and upright wisdom. Nor, we regret to say, can we, upon deliberately considering the matter, wonder that such a statement should, from being a matter of conjecture, become at once the subject of a serious truth. What can we really think of

ourselves when the world looks upon us as it does? But, alas! for the days we live in, we do not perceive how it can be otherwise, when the trade or profession of physic is conducted as it is—subject, like a pair of gaiters or a Mackintosh waterproof, to the governing sway and fashion of the multitude—followed by countless hundreds, who are, in numbers, greater than those who swam unburied on the banks of the Styx; and who, pursuing their usual routine of circumvallation, with as little reasoning as steam-engines, do not take half so much thought as a tailor in adopting their line of professional practice and treatment to the cases and circumstances which were brought before them.

We shall not always discover in one and the same mind, that dexterous facility in the application of leeches, combined with an equal share of that judgment which renders the whereabouts to place a blister—a matter of far greater understanding and skill. Nor will the same practitioner who cures a typhus fever one day be enabled to relieve a patient who is dying from functional disease of the stomach; the greater chance is that the latter patient will die; and if the doctor pockets anything besides his fee it is the certain consolation arising from the fact, that if he had not entered into a partnership contract with the disease, the probabilities are, that the patient might have numbered many summers more. Such as these are among the number of the multitude of the present day, who envelope all they do in talk; they possess not the strength of that thought and reasoning which can alone disencumber them of the jargon of schools and colleges—than which they have nothing better to offer; and the only satisfaction you derive from either them or their conversation is the sole and simple variety of their manner and language. The doctrines which these theorists preach are always enveloped in doubt and discussion, and if they could be made aware of it, they would come out of this disputatious warfare with a better grace, if they did not occasionally interlard it with some absurd hypotheses of their own. If they see acutely, it is through green spectacles. They will also set themselves up, in the absurd insanity of their imaginations, for critics; and we need scarcely inform the readers of our Miscellany, that medicine and physic abound in criticism. Now, in our profession, we hold it as an axiom, worthy of Hippocrates, that no driveller or theorist will become a critic but from improper and disingenuous motives. Half the medical books in the libraries of the Colleges of Physicians and Surgeons are made up of little else than criticism; but it is always Cribb *versus* Belcher; some brazen idol must be knocked down that a golden calf may be hoisted in its place, which in its turn shall be laid prostrate in the dust whenever its ignorant worshippers shall pant for a greater or a more glaring novelty in their idol.

In this way they will alternately lift up and degrade Sauvages, and Cullen, and Vogel, and twenty more, as they would do also to those German theorists, Stahl, and Hoffman, and Van Helmont. We are of opinion that the archæus and spasm, on which these latter authors so learnedly wrote, may be considered as *par nobile fratrum!* and that if sthenia, and asthenia, and fermentation, nay, and the gastro enteritis of M. Broussais, too, were bottled up in Ariosto's jars, they would be very well disposed of, and the world, including both patients and physicians, would be no losers by the transference; it would only afford another apposite exemplification of exchange being no robbery.

There are some few among the continental physicians, who, in the violent outbursts of their theoretical fury, have declared that English physicians are wrong in every thing—ignorant of every thing—more ignorant ourselves than all Europe put together—poisoning quacks—empirics—ontologists, and we scarce know what besides. They declare that we can transfer cancers from the bosom of the wife to the stomach of her husband; a discovery on a par perhaps with that of General Pillet, who found out that the prisoners at Norman Cross had eaten up Lord Cawdor's horse, saddle and all. With that candour and caution which becomes us in the days when the aspect of a benign and venerable old age overshadows our countenance, we are meekly willing to confess that, in the ranks of our profession, we have had many creature-slayers, who have now gone to mingle with the countless crowds of those who went before them into "the presence." We have, truly we confess it, had our share of bad practitioners, and bad practice, and bad medical books, besides ontologists, and Brownists, and spasmodians, and humorists, and Abernethys, and Brodums, and Hunters, and Solomons, and last, though not least, we have had Eadys and Morisons. Verily the English nation would be in a most unpoetical and unpicturesque plight were they to be responsible for all the medico-chirurgical enormities and absurdities which any one of the above-named gentry may at any one period or another of their mortal existences have committed. We, who are somewhat better read in the manners of our foreign brethren, should be very loth to pin our faith to the prime belief that all Frenchmen wore wooden shoes and lived upon frogs: were such a fact a matter of true history, our sympathy and pity would be concentrated upon the fact or their being martyrs to corns and indigestion. That terrier spirit which influences the continental physicians in their criticism upon the theories and practices of English doctors, is such as would actuate a mastiff in worrying a rat or a badger. We may admit that the race of "pepper and mustard" is a useful race, and we should be glad if some of the number of *Messieurs les*

Médécins would accompany Monsieur Chabert in his next fire-eating trip to London, and read a few more of our books, and thus be enabled to distinguish between Dr. Bree and Martin Bree, and between Messrs. Cooper and Co. and Sir Astley Cooper, and thus treat us with proper corrosives—escharotics and vesicatories, only taking care to apply them to the diseased and not to the sound parts. We may tell them (and our many days, if we may so say, have been

pregnant with much experience,) that their practice is greatly injured and seriously deteriorated by a theoretical fatalism, which abounds in it. This Turkish creed, which they amalgamate into all their doctrines, is most abundantly and pre-eminently mischievous, whenever it is either detected or openly exposed, whether it be among the high or the low, in the palace or the garret, in physic, in morals, or in religion.

ΕΡΧΟΝ.

PERSIAN ANECDOTES.

(From the *Athenæum*.)

By various pious frauds the Soonny priests endeavoured to provoke the sovereign, Octai, against the professors of the Shiah faith; they saw impossible visions, and belied the prophet, who appeared to them in their dreams or in their meditations, bitterly lamenting the total ruin of his abused religion.

The enlightened Octai notwithstanding remained firm in his benevolent purpose, and maintained his resolution to preserve his character from being stained by acts of cruelty. A bigoted wretch—a Persian by birth—who had embraced the Mogul faith, and by his hypocrisy or enthusiasm had ingratiated himself with the leaders of that creed, thereby obtaining amongst them the reputation of a saint, once called upon the king, apparently in great perplexity and consternation. Feigning much agitation and distress, in a tremulous and doleful voice, he exclaimed, "O prince, thou hast thy father much offended! I saw the holy Zingis in a vision last night, who, in great anger, bade me to hasten and inform you that you have excited his indignation by your unlawful tolerance of the infidel Shiahs; and that unless you speedily quenched his burning wrath by a general effusion of the blood of the Râfizy-dogs, he will renounce you as an evil son, and let his curses fall upon you!" Octai gazed upon him for a while, and then calmly asked, "Did my holy father speak to you himself, or convey this message to you through some interpreter?" "Himself, himself," was the reply. "Do you understand the Mogul language?" inquired the Prince. Here the fanatic imposter was confounded, and was obliged to answer in the negative. "Thou art a liar," said the indignant Octai, "and a mocker of thy sovereign, for my father was ignorant of every other language."

When the new faith was first introduced, the prophet undertook personally to instruct his followers in the form and duties of his religion; particularly in the Manassik, or the ceremonies to be observed on the pilgrimage to Mecca. One day (during the season of the Huj) he was engaged with a large party of pilgrims in performing the Harwallah—a sort of dancing trot,

accompanied by the simultaneous motion of every limb and muscle, and by a succession of gurgling noises in the throat, such as none but a dromedary can imitate. While thus occupied, Omar, the second Khalif, broke out into a fit of laughter, much to the indignation of the prophet, who rebuked him, sharply for his want of reverence and decorum. Omar apologised, by assuring the prophet that his laughter had not been excited by the holy ceremony, but by the remembrance of a circumstance which had happened to him during the "days of ignorance." "Once," he continued, "whilst on a journey to Mecca with a few companions, we reached this very spot, worn out with fatigue and exhausted with hunger, having passed a day and night without food. Unable to proceed further, we prayed to the images of those deities—(made out of a composition of date and flour)—which we carried with us. But the idols were deaf to our supplications, and we were at last obliged to eat the very gods we had so lately worshipped."

The glorious days of the house of Bani-Abbas had already been numbered, but the effeminate Mostassam had personal vices enough to lead to and excuse the final extinction of his race! Ebni-Alkamy, his prime minister (who hated him more than any other of his oppressed subjects) from within, and Naseer-uddean, the preceptor of the Mogul prince (who owed him an old grudge) from without, urged the conqueror to the gates of Bagdad. Naseer-uddean had a few years before been at Bagdad, seeking shelter from persecution; when he was introduced to Mostassam, the latter asked him to what country he belonged? "Toos, please your highness," answered Naseer-uddean. "Art thou of the asses, or of the oxen of Toos?" said the Khalif (meaning the two principal branches of the Shiah faith—Akhbaries and Usoolies). Mortified as the illustrious refugee was at this inhospitable insult, he still submissively answered, "Of the oxen of Toos, please your highness." "Where then are thy horns?" said the insolent buffoon. "I have them not with me," replied Naseer-uddean, "but if your holiness permit me, I will go and fetch them." "Make haste hence, thou deformed animal,"

said the Khalif, "and never again appear in my presence in so imperfect a state!" Naseer-uddean hept his promise well, for, at the moment when Bagdad was on the point of being surrendered, and the Khalif driven to the last extremity, he sent him a message to the effect that the ox of Toos was at the gate with *his horns*, and inquiring, when would it please his holiness to receive him? Naseer-uddean had in the city another old offender, whom he was anxious also to chastise. This was Ebni-Hajeb, also one of the Khalif's ministers, and a person of great reputation for his learning; but, being an Arabian Soonly, and a very bigotted one too, he had behaved still more cruelly than his master to the distressed Persian Shiah when he sought protection at Bagdad. Ebni-Hajeb having been seized with depression of spirits, the physicians recommended him (and the priests granted him dispensation) to take, occasionally, a little wine. This happened when Naseer-uddean was at Bagdad. One day, Ebni-Hajeb feeling himself particularly melancholy, and having, in consequence, taken a larger dose than usual, he became unusually merry; and in that state he ordered his boat to be made ready, and requested Naseer-uddean to accompany him on the Tigris. Having reached the middle of the stream, he stopped the boat, and produced the several volumes of Naseer-uddean's works, which the learned refugee had presented to the Khalif—some of them in the original manuscript, and not yet transcribed, and, in the presence of their anxious author, he threw them all, one after another, into the river, with such spiteful force that the water was splashed about in every direction: when, turning himself, on each occasion, to his mortified guest, he exclaimed in Arabic, and with a sarcastic smile of triumph, "How wonderfully it bubbles!" When the turn of Naseer-uddean came, he, too, gave full vent to his revenge. He ordered Ebni-Hajeb to be cased, up to his neck, in an ox's hide, just taken off the animal, and, having filled the skin with air, he laid it for a few hours in the sun, till it became quite dry, and sounded like a drum. Then the victor advanced close to his half-exhausted enemy, gave him a kick of triumph, and, as he rolled on the ground, exclaimed in Arabic also, "How wonderfully it rattles!" This brutal severity towards a helpless captive, is an everlasting stain on the otherwise illustrious character of this distinguished man.

When the power of the Khalifs was diminished from the usurpations of not a few adventurers, they had the mortification of beholding the finest kingdoms and provinces seized upon and erected into independent states. An outward show of respect, (not more than that paid to the pope by the European sovereigns of the last century,) was all that the head of the Mahomedan religion received; the substantial power being completely

in the hands of the monarchs of Ghaznah and the kings of Persia. The great Mahmood, indeed, the patron of Ferdousy, treated the Khalif with the utmost respect. On ascending the throne of his father, he sent an ambassador to Bagdad, with a magnificent present, to entreat the Khalif's blessing and solicit a title from him. His envoy lingered for a whole year in the capital, without being able to accomplish the wishes of his sovereign. At last the grand vizier of the Mohammedan Pontiff, finding his master in a remarkably good humour, ventured to represent to him that the ambassador of Mahmood, who had contributed so much to the cause of the true religion, and treated the Prophet's representative with great reverence, had been long detained, waiting for permission to depart with a title for his master. "I am aware of it," replied the Khalif, "but I know not how to comply with Mahmood's wish: what title could I confer on him without degrading all similar distinctions? Mahmood's father it is true, was a prince; but his mother was a slave. Yet I am unwilling to disappoint him, lest he should become desperate, and an enemy to the true faith. Could we not find some equivocal word, the use of which would, at the same time, express his parentage, and yet, from his ignorance of Arabic, satisfy his desire?" After some deliberation they hit upon the word "Wily," which in Arabic, means not only "a friend," but also "a slave:" it is needless to point out in which sense they applied it. But Mahmood, and the learned men of his court, were not so ignorant as the Khalif had imagined; and the ambassador was sent back to the Khalafat with a hundred thousand dirhems, and the following petition:—"Mahmood, the humble dog of the dignified threshold of the Khalafat, who, by the blessing of God, and through the prayers of your holiness, has converted a thousand grand temples of the idols into Mohammedan mosques, and extended the true faith over a vast portion of the globe, now sends 100,000 dirhems as an offering to be laid at your holiness' feet, and humbly entreats that, in return, your holiness' servants would vouchsafe to add to the distinguished title already bestowed upon him one single letter, and that this should be the letter Alif, (A.)" The request was granted, and Mahmood thereby changed his title from "Wily" to "Wally," the latter word signifying "a prince."

Yazeed, who reigned at Damascus about the year 679, was a man of considerable taste and refinement, an eloquent orator, and an admired poet. Some specimens of his composition, which are still extant, display no ordinary powers of mind. The first and the last lines of the ode with which the bard of Persia, the celebrated Hafiz, opens his magnificent "*Divan*" (*work*), are borrowed from Yazeed. It was once sarcastically asked of Hafiz, "How could a distinguished poet like yourself, a Shiah too, stoop to borrow from

Yazeed, who was not merely a Soonny and a usurper, but also the murderer of Hosseyn, our third Imam?" He answered, "Which of you, seeing a dog running away with a diamond, would not stop the brute, and rescue the jewel from his unclean mouth?"

The Zand king was affable and gracious, and anxious to make his subjects happy, but, unfortunately for the literary institutions of the country, he was exceedingly rude and illiterate. Ignorance, indeed, in the superlative degree, was "the badge of all his tribe:" and scarcely a single individual out of so many different families of the Zand dynasty, had the least pretension to refinement; with the exception of the king himself—who was at least humane and benevolent—they were in fact a band of illiterate, selfish, half savage robbers. As an example, one of them once beat a poor wretched scribe nearly to death, for not having a letter ready written, which he wanted to send to his wife. "You rascal," roared the foaming grandee, "when I go to a shoemaker, or a hatter, they fit me in a moment; how is it that you beggarly writers alone require a previous notice, and the description of the kind of letter, such as a man should send to his wife? If you are a scribe by trade why have you not a sufficient stock of wares to supply your customers with?"

Kareem Khan bestowed great care on the education of his eldest and only son—Abul-fatah Khan, whom he destined to his throne; but the weak prince possessed no talent whatever, and all the pains and diligence of the many literary men, whom his father intrusted with his education, were entirely thrown away. He not only fancied himself a poet, but that his wretched compositions were equal to the most celebrated works of either ancient or modern bards. Being a prince, and presumptive heir to the kingdom, he had been perhaps too much flattered; and the frankness of Meerza Reza—the first poet of the age—(whom the prince once importuned to tell what he honestly thought of one of his odes,) proved too sharp for his irritable temper. He treated his eminent tutor even worse than the mortified archbishop did the honest Gil Blas; for, darting a fierce look on the object of his indignation, he exclaimed, "I often tell my father that you poets and grammarians are great asses, but he himself being a greater ass, he never believes me. Here," said he to his attendants, "take this old donkey into the stable, put a halter on his head, tie him there, and let him eat straw till his understanding is improved." The order was executed accordingly; but the prime minister rushed into the presence of the royal poet, and entreated him to consider the consequence of this rash sentence. "This man," he continued, "whom your royal highness has so disgracefully punished, independently of being your own preceptor, is a great favourite with his majesty; and what will

the king say,—what will be his feelings when he hears you have treated his friend in this manner?" This remonstrance had some effect, and Meerza Reza was delivered from his ignominious situation. A few days after, another fit of the *cacoethes scribendi* came upon his royal highness, and he produced another wretched ode. The unfortunate Meerza Reza was again sent for, and the prince having apologised for his past indignity, repeated his new ode, and most emphatically a second time put the Meerza on his honour to declare what he thought of it. The poet paused a while; then rose gently from his seat, made a profound bow, and, without saying a word, proceeded to leave the room. Surprized at this behaviour, the prince called after him—"Where art thou going, Meerza?"—"To the stable, please your royal highness," answered the poet, "to save you the trouble of sending me there."

While at Kermanshai, a collector of the revenue, who had embezzled a large sum of money, fled from the officers of justice, and took refuge in the house of Auka Mohammed Aly, the Mojtahed (or chief Mulla) of the city. The king demanded the man: but the Mulla would not surrender him, although he declared himself willing to hear and decide the case, if the king would send his Vakeel (or counsel) thither. The proud monarch would not be dictated to, and the scrupulous priest would not abate a jot of his privilege. The king at length became enraged, and directed his officers to proceed in a body, and drag the man out of his sanctuary. The exasperated Mojtahed immediately proceeded from his house to the great mosque, bidding the people follow him there, for the Mohammedan religion was endangered by an infidel usurper. In less than two hours the news spread throughout the city and the camp, and an immense multitude were assembled in the great Jamea: the Mojtahed then ascended the pulpit, and there denounced Mohammed Khan as an unbeliever, on whom in a most solemn manner he pronounced sentence of excommunication, and exhorted the faithful, in the words of the prophet, to revolt against an infidel king, who himself had revolted against religion. The shops, and even the mosques, were forthwith closed; all business was suspended; and denunciations against the king were uttered by all classes of his subjects. His soldiers everywhere identified themselves with the people, and his nobles and courtiers would have deserted him, had he not accepted the only alternative they suggested, and with a sword hung about his neck, and with the Koran in his hand, the absolute monarch of all Persia, in the presence of thousands of his subjects, knelt down before the head of the Mohammedan religion, and implored his mercy in a flood of tears! "Rise," said the exulting prelate; "if thou comest in this manner like a repentant child, it is my duty to forgive thee, and pray that God may forgive thee too.

Be virtuous, and fear not, thou art the king of Persia, and the defender of the faith." The Mojtahed had only to ascend the pulpit once more, and to announce his satisfaction at the king's conduct, when the people gradually retired, and in a few hours order was entirely restored.

SAVA SAVEETCH AND HIS CLERK.

A RUSSIAN SKETCH.

SAVA SAVEETCH was reckoned one of the cleverest sheriffs in the whole province. He was of a full figure, and, from having served some time in the police dragoons, still retained his military attitudes and manner, kept himself always as straight as a rush, and in turning, made a rapid "face-about" with his whole body. Years, and the fumes of his potations, had weakened the roots of his hair, so that he had almost lost it entirely, except some tufts on his whiskers and chin. His long nose, and the extremities of his meagre face, were covered with livid carbuncles; and from under his bushy, hoary eyebrows glared a pair of small grey, cattish eyes. He always went about in his official uniform surtout, and wore in his waist a Cossack *portépée*. He never put on his sword but when he went upon any official business; his usual weapon was a Cossack whip, with a leaden bullet plaited into the end of it. His head was generally covered with a stiff-crowned leathern cap, which added to his military appearance. His voice was like the growling of a bear. His writing department was managed by an old clerk, who spent three-fourths of his time with his leg tethered to a writing table. In addition to this, by Sava Saveetch's orders, his boots were taken off, to prevent him from decamping to the cabaret. But the supple clerk found the road to the bottle without rising from his chair. Some of his cronies among the under-strappers would fetch him *vodky*, in apothecaries' phials, several doses of which he would dispatch every hour, from the time that Sava Saveetch

had, in quest of his bottles and cans, ransacked the stove, chimney, and even behind the casks and tubs. On holidays only he had liberty to get drunk; and then he was usually brought home at night as stiff as a stock, laid in the lock-up room, and water poured upon him. In his journeys through the district, Phomeetch (this was his name) had also full permission to drink a settling bowlful, but only after he had finished his business; for after his drunken bouts, his hand shook so as to render him unfit for work. Sava Saveetch called Phomeetch a golden man; and his inclination to drunkenness he attributed to his uncommon talents, which, in the opinion of old-fashioned people, cannot flourish unless they are moistened with spiritual dew. According to this maxim, Sava Saveetch was himself a genius; however, to give him his due, Sava Saveetch was thoroughly versed in business, particularly in conducting examinations, following up proofs, and general investigations, only he did not know how to put his thoughts upon paper so easily as he could pour ardent spirits down his throat—could not pick out for himself, in both capitals, such a pair of spectacles as would enable him to read hastily-written papers, even by syllables, the same as if they were printed; and, owing to the multiplicity of business, did not recollect the dates of the ukases. In this Phomeetch was his Mentor. The inhabitants of the district, as a tribute of justice to Sava Saveetch, called him the "Grey Wolf," and his faithful coadjutor Phomeetch, was called the "Trap."

LINES WRITTEN AT THE REQUEST OF A LADY WHO HAD LATELY BECOME BLIND.

THY will be done, O God, thy will be done!
 Though to these sightless orbs for ever hid
 All forms of beauty, and all smiles of love,
 The sun his splendour, and the moon her light,
 The canopy of heaven a starless void,
 And the fair landscape, rich with varied hues,
 The verdant fields, the blooming trees and flowers,
 The sun-lit stream, bright flowing through the vale,
 Alike to me one universal gloom.
 Thou still art present, and thy light Divine
 Shines brighter 'mid the darkness of the scene:
 That inward light sustains and cheers my heart;
 Thyself more fixed my soul to look upon,
 By outward hinderance now the less obscured.
 Things seen by mortal eye must pass away,
 How soon! but the invisible remain,

Remain for ever, by that light revealed.
 Thou primal Source of light, and life, and joy!
 Eternal Father! shine into my heart,
 There let the image of my Saviour dwell,
 Bright with thy Spirit's effluence Divine;
 Sustain, 'mid all my complicated woes,
 My sinking faith, that I may bear them well—
 With resignation meek and patient hope,
 Unmoved by suffering, unsubdued by death.
 And when released from this dark tenement,
 May I behold the bright unclouded Sun
 Of Righteousness arise, and radiant shine
 In His eternal light, amid the choir
 Of seraphim, hymning the grateful song
 Of Moses and the Lamb around thy throne.
 Jan. 10th, 1837.

R. S.

NATIONAL CUSTOMS.

CAFFRARIA.—When visited by sickness and the harbingers of death, the benighted mind of the Caffre is distracted by dreadful apprehensions and tormenting fears; these, however, he carefully conceals, and can seldom be prevailed upon to give free expression to his feelings, even when consciously sinking in the very agonies of dissolution. Tears are regarded as the proof of an imbecile and unmanly spirit; hence, whatever pain he may endure, he seldom suffers nature thereby to relieve herself; nevertheless, the gross darkness that envelopes his soul is awfully manifest at this dread crisis. No sooner do convulsive symptoms make their appearance than the dying are immediately declared to be dead; and are at once carried out into the forest, or laid in a ditch out of sight, and at a distance from the place of their residence. Two reasons are assigned for this inhuman measure: first, that the hamlet may not be defiled by the breathless body lying in it; and, secondly, that it may not be requisite for any one to touch the corpse after the spirit has departed. It is a fact, and to every thinking mind a heartrending fact, that thousands are thus dragged from their habitations by their nearest relatives, and literally placed in "the region and shadow of death" while in the actual possession of all their rational faculties. Such is the melancholy situation of numbers at this very moment, wholly destitute of every degree of comfort, and of the faintest gleam of hope, regarding either this world or that which is to come. No friendly voice is heard cheering them amidst the struggles of dissolving nature; no kindly-helping hand is lent to turn them from side to side; nor have their sinking spirits any the least expectation of a Deliverer. For, alas! they know not that there is a Saviour. The moment the spark of life becomes extinct, and sometimes before, "ravening wolves around" feed upon their remains unmolested.—*Kay's Travels in Caffraria.*

NORWAY.—There is a very simple and very ancient way of assembling the people in this country for public business. A bud-stick, or message-stick, the size and shape of our constable's baton, is painted and stamped with the royal arms, and made hollow, with a head to screw on one end, and an iron spike on the other. The official notice to meet, the time, place, and object, are written on a piece of paper, which is rolled up, and placed in the hollow. This is delivered from the public office, or court-house, of the district to the nearest householder, who is bound by law to carry it within a certain time to his nearest neighbour, who must transmit it to the next, and so on. In case of two houses, equally distant, it must be previously determined by the fogs at which he shall deliver it. If the owner is not at home, he is to stick it "in the house-father's great chair, by the fireside;" and if the door be locked, must fasten it to the outside. Each is bound to prove, if required, at what hour he received, delivered, or stuck it. He who, by his neglect, has prevented others from receiving the notice in time to attend the meeting, pays a fine for each person so absent. There are fixed stations at which the bud-stick rests for the night; and it cannot be carried after sunset, or before sunrise. The householder to whom it comes last takes it back to the office. In a country so extensive, with its population scattered in valleys, divided by uninhabited fjelde, and with few paths of communication, this primitive sort of gazette is the most expeditious mode of publication. In the Highlands of Scotland, the stick, burnt at one end, and with blood on the other, was a similar device for assembling a clan in arms.—*Laing's Norway.*

CHINA.—The tongues of ducks are among the dainties of Chinese epicures. In one of the lanes running westward from Leuenhing Keae, there is a shop containing a great variety of live fowls, besides several species of dried ones, for sale. One article puzzled

me much; and by inquiry I found it to be nothing more nor less than a string of dried tongues obtained from ducks. They were stretched out to the utmost length, resembling awls in shape, and hardened almost to the firmness of iron.—*Chinese Repository.*

ICELAND.—The most important branch of rural labour in Iceland is the haymaking. About the middle of July the peasant begins to cut down the grass of the tún, (the green around his house,) which is immediately gathered to a convenient place, in order to dry; and, after having been turned once or twice, is conveyed home on horseback to the yard, where it is made up into stacks. At the poorer farms, both men and women handle the scythe; but in general the women only assist in making the hay after it is cut. In many parts of the island, where there is much hay, the peasants hire men from the fishing plains, who are paid for their labour at the rate of thirty pounds of butter a week. They cut by measurement; the daily task being about thirty square fathoms. Hay-harvest being over, the sheep and cattle that had been out all summer on the mountains are collected; the houses are put into a state of repair for the winter; the wood needed for domestic purposes is brought home to each farm; the turf is also taken in. During the winter, the care of the cattle and the sheep devolves entirely on the men; and consists chiefly in feeding and watering the former, which are kept in the house, while the latter are turned out in the daytime to seek their food through the snow. When the snow happens to be so deep that they cannot scrape it away themselves, the boys do it for them; and as the sustenance thus procured is exceedingly scanty, they generally get a little of the meadow hay about this time. The farm hay is given to the cows alone. All the horses, excepting perhaps a favourite riding-horse, are left to shift for themselves the whole winter, during which season they never lie down, but rest themselves by standing in some place of shelter.—*Henderson's Iceland.*

EGYPT.—In Egypt, the dead, after being embalmed, were deposited, in great numbers, in caves or places formed under ground. These are now known by the name of "mummy pits." The following is an interesting account of a visit to one of them:—"We now went to see the mummy pits. It is impossible to conceive a more singular and astonishing sight than a tomb of this description. Imagine a cave of considerable magnitude, filled up with heaps of dead bodies in all directions, and in the most whimsical attitudes: some with extended arms, others holding out a right hand, and apparently in the attitude of addressing you; some prostrate, others with their heels sticking up in the air. At every step, you thrust your feet through a body or crush a head. Most of the bodies are enveloped with linen, coated with gum, &c., for their better preservation. Some of the linen is of a texture remarkably fine, far surpassing what is made in Egypt at this day, and proving that their manufactures must have arrived at a great degree of excellence. Many of the bodies, probably of the lower orders, are simply dried, without any envelopment. Innumerable fragments of small idols are scattered about; they are mostly human figures of Osiris, about two inches long, with the hook and scourge in either hand: some are of stone, some of baked earthenware, and others of blue pottery. The bodies are stowed in compact masses, tier on tier, always crossing each other. In some instances we found the hair quite perfect. It was in a tomb of this description that some of the diggers found a beautiful network, composed of long blue beads, hollow, with threads passed through them; the parts of the net hanging down over the shoulders, and all emanating from a *scarabæus thebaicus*, which was on the crown of the head. It was found on the head of a female mummy."—*Irby and Mangies' Travels.*

GEMS.

MEMORY.—We all know what a power there is in memory, when made to array, before the guilty, days and scenes of comparative innocence. It is with an absolutely crushing might that the remembrance of the years and home of his boyhood will come upon the criminal, when brought to a pause in his career of misdoing, and perhaps about to suffer its penalties. If we knew his early history, and it would bear us out in the attempt, we should make it our business to set before him the scenery of his native village, the cottage where he was born, the school to which he was sent, the church where he first heard the Gospel preached; and we should call to his recollection the father and the mother, long since gathered to their rest, who made him kneel down night and morning, and who instructed him out of the Bible, and who warned him, even with tears, against evil ways and evil companions. We should remind him how peacefully his days then glided away; with how much of happiness he was blessed in possession, how much of hope in prospect. And he may be now a hardened and desperate man: but he will never believe, that, as his young days were thus passing before him, and the reverend forms of his parents came back from the grave, and the trees that grew round his birthplace waved over him their foliage, and he saw himself once more as he was in early life, when he knew crime but by name, and knew it only to abhor—we will never believe that he could be proof against this mustering of the past: he might be proof against invective, proof against reproach, proof against remonstrance; but when we brought memory to bear upon him, and bade it people itself with all the imagery of youth, we believe that, for the moment at least, the obdurate being would be subdued, and a sudden gush of tears prove that we had opened a long sealed-up fountain.—*Méville.*

SCIENCE.—It furnishes those comprehensive analogies, and contrasts, and varieties of fact, which awaken recollection, and exercise and strengthen the mind; which serve to correct precipitancy of judgment, to render us ingenuous in our deductions, temperate in the formation, and modest in the maintenance, of opinion—to confirm those high intellectual and moral habits that eminently qualify for religious study. What a noble capacity for the defence of our holy mysteries is matured under the discipline of abstract science! Within its sublime recesses are wrought and tempered the swords of flame that move on the battlements of our paradise; from this school have issued the mightiest champions of the faith. The pursuits of taste, by cultivating our powers of contemplating the good and the fair, and by evolving our susceptibilities of pleasure from such perceptions, co-operate with religion in refining and elevating character. Do they not also diffuse a peculiar charm through the sacred writings, that detain us oftentimes to linger with fondness over their pages—entice many, by whom they might otherwise be neglected, to the perusal of them—and allays much of the repugnance that is felt at the purity of their morals, and the stern consistency of their truths? Does not history confirm the record of the inspired narrators—the knowledge of ancient customs reconcile apparent discrepancies—and geology lend a tributary light to illumine the earliest details of revelation?

How full, how exquisite, are the manifestations of God, that are presented in the study of his works! How impressively do his nature and character affect the mind, which, ascending the heights of science, lays itself open to the moral power of the scene that expands around—contemplates the silent, viewless energy that impresses the mightier movements, that supports the complicated relations of the universe, that endues each department with its properties, that, by its visitation, preserveth the spirits it hath made, that deviseth

the organization of every living thing moving on the face of the earth, that arrayeth the structure of every plant!

Science and literature kneel at the shrine of religion; and although visionaries would put forth their hands to thrust it back, she accepts the offering.—*Rev. A. Waugh, jun.*

WAR.—The history of every war is very like a scene I once saw in Nithsdale. Two boys, from different schools, met one fine day upon the ice. They eyed each other with rather jealous and indignant looks, and with defiance on each brow. "What are ye glowrin' at Billy?" "What's that to you? I'll look where I have a mind, an' hinder me if ye daur." A hearty blow was the return to this; and there such a battle began. It being Saturday, all the boys of both schools were on the ice, and the fight instantly became general and desperate. At one time they fought with missile weapons, such as stones and snow-balls; but at length they coped in a rage, and many bloody raps were liberally given and received. I went up to try if I could pacify them; for by this time a number of little girls had joined the affray, and I was afraid they would be killed; so, addressing the one party, I asked what they were peltin' the others for? What had they done to them? "O, naething at a', man; we just want to gie them a good thrashin." After fighting till they were quite exhausted, one of the principal heroes stepped forth between, covered with blood, and his clothes torn to tatters, and addressed the belligerent parties thus: "Weel, I'll tell ye what we'll do wi' ye: if ye'll let us alane, we'll let you alane." There was no more of it; the war was at an end, and the boys scattered away to their play. I thought at the time, and have often thought since, that that trivial affray was the best epitome of war in general that I had ever seen. Kings and ministers of state are just a set of grown-up children; exactly like the children I speak of, with only this material difference, that, instead of fighting out the needless quarrels they have raised, they sit in safety and look on, hound out their innocent but servile subjects to battle; and then, after a waste of blood and treasure, we are glad to make the boy's condition,—*"If ye'll let us alane, we'll let you alane."*—*Hogg.*

FASHION.—Fashion rules the world, and a most tyrannical mistress she is, compelling people to submit to the most inconvenient things imaginable, for her sake. She pinches our feet with shoes, or almost chokes us with a tight neckerchief, or nearly takes away our breath by tight lacing. She makes people sit up at night when they ought to be in bed, and keeps them there in the morning when they ought to be up and doing. She makes it vulgar to wait upon one's self, and genteel to live idle and useless. She compels people to visit when they would rather stay at home, eat when they are not hungry, and drink when they are not thirsty. She invades our pleasure, and interrupts our business. She persuades people to dress gaily, either on their own property or that of others; or whether agreeable to the word of God or the dictate of pride. She ruins health, and produces sickness; destroys life, and occasions premature death. She makes fools of parents, invalids of children, and servants of all. She is a tormentor of conscience, a despoiler of morality, and an enemy of religion; nor can any one be her companion and enjoy either. She is a despot of the highest grade, full of intrigue and cunning; and yet husbands and wives, parents and children, masters and servants, of every colour and of every clime, have become her devotees, and vie with each other who shall be most ardent in their attachment.—*Christian Sentinel.*

LIFE AND MANNERS.

GEORGE IV.—The following anecdote was related to me, says Dr. Sprague, of America, in his letters furnishing an account of his journey to Europe, of his late majesty, as being well authenticated. When he was in Ireland, two or three years since, he told Lord Roden, a man of decided Christian character, that on a particular morning he was coming to breakfast with him. He accordingly came, and bringing with him two or three of the nobility, happened to arrive just as his lordship and family assembled for domestic worship. Lord Roden being told that his guest had arrived, went to the door, and met him with every expression of respect, and seated him, and the gentlemen that accompanied him, in his parlour. He then turned to the king and said, "Your majesty will not doubt that I feel highly honoured by this visit; but there is a duty which I have not yet discharged this morning, which I owe to the King of kings—that of performing domestic worship; and your majesty will be kind enough to excuse me while I retire with my household and attend to it." "Certainly," replied the king, "but I am going with you," and immediately rose and followed him down into the hall, where his family were assembled, and taking his station in an old arm-chair, which, I understand, has acquired an immense value from that circumstance, remained during the family devotions. This anecdote certainly reflects honour upon his lordship and his majesty; while it exhibits in the one the dignity of unyielding Christian principle, it displays in the other at least the courtesy of a gentleman, and the natural homage which every man feels for a constant, religious character.

A DIFFICULTY OVERCOME.—A ridiculous instance of the change effected in public opinion of late occurred a short time previously to my arrival at the Egyptian capital: a Levantine tradesman of Cairo, wishing, probably, to do honour to his patron St. Anthony, and at the same time to give his friends a treat, took a joint of pork to be cooked at a Mahomedan bakehouse. The backsliding baker of the faithful made no scruple in admitting the unclean flesh to cook in company with orthodox meats; but one of his customers, a more rigid observer of the Koran, on coming for his bit of buffalo, discovered it with horror, baking alongside the smoking ribs and crackling skin of the abominated beast, and raised an outcry against the offending baker, who was instantly dragged before Habib Effendi, (a sort of sitting magistrate of the Egyptian metropolis,) and ordered to explain forthwith his reason for daring thus to set the mandates of the prophet at defiance. "Truly," said the trembling culprit, "I have lately witnessed such changes in Egypt, that I thought I was committing no sin. Do I not daily see Moslem soldiers equipped as Franks? Beys, half-dressed as Franks? Women shamelessly exposing their faces like Franks? Frank dishes eaten—nay, even Frank wines drank? Could I, with such sights before my eyes, suppose there was any sin in allowing a piece of Frank pork to bake quietly by the side of Mussulmanish meats?"—adding that, in what he had done, he had, in fact, but acted up to the "spirit of the age." The Mahomedan sage was a little staggered; he admitted, however true all that had been stated might be, (and he regretted to say that there was much in the example of some who should know better, to lead away ignorant men like the culprit,) yet he was placed there to see that all the faithful inhabitants of Cairo acted up to the "spirit of the Koran"—that pork was pork; and the precepts of the prophet must be obeyed. A quibbling Moolah here observed, that fire was a

purifier of all things—upon which, after a consultation, it was decided, that no harm could have been done to the other meats in the oven, by the steam of the Levantine's pork, and the complaint was dismissed. The triumphant baker now professes to roast "Frank and other meats," and has had a thriving business ever since the wise decision of the judge in his favour.—*Scott's Rambles in Egypt and Candia.*

ANTEDILUVIAN LONGEVITY.—In how short compass is included all that the Spirit of God has seen meet to record of the greater part of those patriarchs who lived between Adam and Noah! Long as was the life of those men, and very long as that of some of them, their birth and their death is here separated only by a few lines. "And he died," is the affecting close of the little narrative of one after another. Even the hoary Methuselah, over whom nine hundred and sixty and nine years rolled in long and weary succession, passes from us with this brief memorial, "he died." Was it because their lives were so unprofitably spent, that nothing was judged to be worthy of record? Or was it because, in their times, no important addition was made to the stock of revealed truth—no further light thrown on the designs of mercy, obscurely intimated in the first promise, and unfolded by subsequent events, which were therefore judged more deserving of a place in the sacred history? Whatever may have been the reason, we are sure, at least, it was not because during those successive generations there was wanting a like variety of incidents, a like mixture of good and evil, to that which chequers the life of men now. Enos and Cainan, Jared and Methuselah, had their pleasures and their pains, their joys and their griefs, just as Abraham and Jacob had. They had their active days, and the days when they leaned on the staff, and sat at the door of the tent. Once the cultivators of the ground, they at length looked on, as others handled the implements they could no longer wield. They married and gave in marriage, they built and they planted, they sowed and they gathered, they reared altars, and slew sacrifices, and digged wells. But when gone by, how short does their long day appear! What a little portion of the line of time does it fill up! "Their love, and their hatred, and their envy, are now perished, neither have they any more a portion for ever in anything that is done under the sun." The short sum is this—they were born—they lived a while—they died.—*Willis.*

A DEAR LOBSTER.—The late Duke of Norfolk was fond of the luxuries of the table, and, although apparently as joyous and blithesome as any one, he could be as morose and ill-tempered as any person breathing. Those who knew him could pretty well anticipate when a breeze was likely to spring up, as an ebullition of temper was always preceded by a convulsive heaving of his ponderous shoulders, as exemplified by the following trait:—A select party, about twelve in number, had assembled in St. James's square, and were partaking of a sumptuous dinner, when, on a sudden, the earl-marshal's shoulders began to undulate, and the following short colloquy between a then-favoured servant and his grace took place: "I do not see a lobster on the table, Dodson." "No, your grace." "I think I ordered one, sir," roared the Duke. "Yes," replied Dodson, "you did, your grace; and I bid as far as 4*l.* 16*s.* for one; but, there being but one in the market, I could not get it: the same lobster being divided between the Lords Anglesea and Sefton, who were resolved to have it!" Jockey of Norfolk said no more.

BROKEN SHIPS COME TO LAND.

Yea, "broken ships *do* come to land," and "thereby hangs a tale" worth telling; though a tale of this kind is very often most effectively told in the answering of a question; and the question here, naturally, and almost necessarily, is, "Why should broken ships come to land?" There is an easy and pleasant answer to this, and to all similar questions, in a very singular work, produced by the learned rector of some parish in Kent, (Bromley, we think, but we will not be positive,) some ten or a dozen of years before the close of the last century.

This learned person, for we believe he was *A.M., Oxon.*, saw meet to pen a new system, or hypothesis, of the working of the world, and all things that therein are; and, as the learned "King Jamie" did, when he essayed to tune the folks of Scotland into a more classical kind of "poesy" than they had previously put in practice, he expounded the "newlis and cautalis" of nature, according to his new hypothesis. In order that this new system might captivate, both the grave and the gay, the author has rendered it in prose, and also in "blank" verse; and it would have puzzled a conjuror, even when the art of conjuration was in the zenith of its ascendancy, to say whether the verse or the prose was the more blank of the two.

The "Analytical Review," to which it was understood that both Priestley and Price contributed at that time, smote the Kentish rector "hip and thigh" on the subject of his duplicate book. Whether the smiting was inflicted by either of the two sharp-quilled authors that we have named, or by one whom we do not choose to name, is a matter of no moment after the lapse of so many years; but the theory therein set forth is public property, although the volume in which it appeared is, in all probability, now as dead as Julius Cesar. It seems that this learned person took for calm earnest the opinion which the satirical author of *Hudibras* puts upon the shoulders of Anaxagoras, the philosopher of Clazomene, namely, that the sun is

"a piece
Of red-hot iron as big as Greece;"

for he maintains, positively and stoutly, that the cause of the earth's gravitating toward the sun, and of all bodies near the surface gravitating to the earth, is the existence of "a great magnet" in the centre of our globe. If he had not been sublimed above all material things, he would, in all probability, have had some perplexity about the difference between this central magnet of the earth, and the magnets with which we are conversant on its surface; because they attract only a very few select substances, while his is a "very whale" of magnets, and attracts all matter equally, in proportion to its quantity, without the smallest distinction as to its quality.

[No. 18. MAY 3, 1837.—2d.]

VOL. I.

This matter of the magnet is not, however, the one which is so unique in itself, and so very convenient for all who are "put to their wits' end" on subjects of physical philosophy. Others besides him have aimed at the performance of mighty deeds, and the overcoming of any tough and gnarled difficulties, by means of magnets. We have, for instance, known of more than one very ingenious, but not very philosophical mechanic, who laboured to produce an engine of perpetual motion by means of magnets; and we have no desire to blame them for their selection; for a magnet is just as likely to produce a perpetual motion as—any other thing that could be named.

The point upon which we have always admitted the universal and beautifully accommodating nature of this reverend person's philosophy has reference to the tides; or, as he calls them, "the flux and reflux of the sea;" and he says that these alternate with each other, "in consequence of their regular and settled habit of so doing." That he learned this most universal and convenient mode of dealing with philosophic difficulties at Oxford, we do not mean to say; but we do mean to say that it is too much for being any one man's discovery, though a dean, or even a bishop, far less a rector.

If we were to take our stand upon this, the most impregnable ground of which we have any knowledge in all philosophy, we should make short work of the matter, and say, that "broken ships come to land" in consequence of their regular and settled habit of so doing. We are fearful, however, that there may be, among the readers of "The Miscellany," some "black sheep," whose "carnal wit and sense" may so far "overcome them," that they may refuse to avail themselves of this short and easy method of dealing with philosophical difficulties; and so, for their perverse and unbelieving sakes, we shall endeavour to give a particular explanation of this fact of the broken ships coming to land.

Substances which are specifically heavier than the water of the sea fall to the bottom as a matter of course; and it depends on the depth in which they sink, and the current of water that may be setting at that depth, whether they shall ever come to the shore or not. If they sink in the profound depths, which we have no reason to believe are affected by any currents, then we must conclude that they remain at rest there, unless they are upheaved to the surface by the action, of course, of those subterraneous powers which the Great Author and Governor of the system of nature has appointed to effect the production of new lands when the old ones are so worn down as to be no longer fit for the support of growth and life.

Leaving these out of the question, and at-

T

tending only to such substances as float on the waters of the ocean, or are liable to be moved by the currents of these waters, we cannot help feeling, if we make our observations with judgment and accuracy, that there is a wonderful difference between the living and the dead. We, of course, do not mean the simple fact of life in the one and no life in the other, because that is involved in the mere use of the epithets by which we distinguish them. But while they are alive, the inhabitants of the sea have no tendency to come to the shore, of the mere physical constitution of their nature; and coming nearer to the land, and removing to a greater distance from it, are movements which all of them that have the power of locomotion perform with equal ease. Many fishes come to the shallows in order to deposit their spawn; and the reason, though they themselves are not, of course, aware of it as *reason*, seems to be, that, in the shallow waters, more action of light, heat, and air operates on the genus, and calls them into life much more speedily and certainly than they would be called were they to be deposited in deeper water. When this operation, the most important one of their lives, is performed, these fishes again betake themselves to much deeper water, in which they remain and recover their strength, and do not again revisit the shores and shallows till they are stimulated by a fresh impulse of reproduction. In their going seaward, they do not appear to have any more severe labour to perform than when they come to the shore; and the conclusion that we may, and must, draw from this is, that they have perfect command of themselves in the sea, and are not induced either to the shores or to the deep water by any power or tendency extrinsic of themselves.

The very same thing holds with animals that are covered with crusts or shells, and with marine plants, when they are in the living state,—not one of them has the slightest tendency to come on shore, by the operation of any general principle, or any principle external of themselves. The medusæ and other radiatæ, which appear to have less command of themselves in the water than any other marine animals, are more frequently found stranded on the beaches. But they are found most abundantly after storms; so that they, too, may be said to be drawn by the wind and the waves, and not drawn by any attraction which exists between them and the land. The same may be said of marine plants. It is true that the greater part of these in our seas are *rooted* plants; but to these the root is a mere support, from or by means of which the rest of the plant derives no nourishment. In other seas, especially in the great eddies of tide in the tropical parts of the oceans, the Atlantic more than any other, as there is a more decided revolution of the current there, there are vast extents of sea-weed which is not rooted, and yet

which is never scattered into the other parts of the sea, while it is in the living state. In short, the fact is perfectly general, and we may state it as such, that the living inhabitants of the water, while they remain in life and health, have no tendency to come to the shore any more than to move in any other direction.

There must be a general reason for this general fact, and that reason is easily seen: the water takes no hold upon the living plant and the living animal,—it does not wet them, it merely surrounds them, and so gives them the support of its weight; but it has no tendency to make them move in any one direction, unless when they are borne away by the mere mechanical force of its current. This is produced upon nearly the same principle as we resort to when we grease the axles and other working parts of our engines and machines, in order to lessen their friction; only, it is done with far more perfection than we can do it. Whether the inhabitant of the water is plant or animal, and if the latter, whether it is covered with skin, with scales, or with a shell, there is always an *epidermis*, or scarf-skin, upon it, which cannot be wetted by any length of exposure to the water as long as the creature is alive.

This is produced by a sort of mucous secretion which lubricates the epidermis, and which is not soluble in water so long as the creature is alive. This differs in quantity, and probably also in kind, in the different species, being greater, generally speaking, in proportion as the fish has more action in the water. Skate, for instance, drives about so rapidly that they have been called the “eagles of the sea,” and they are among the most mucous of all the finny race. Soles, on the other hand, range but little, and the quantity of mucus upon them is proportionably small. In all, however, it is perfectly adapted to the need the animal has for it, upon the beautiful principle of “no want no waste,” which is clearly traceable through the whole of creation. This mucus is a secretion of the animal or the plant, and must, as a matter of course, cease to have any influence very soon after death occurs. Any one may be practically convinced of the truth of this by observing how very soon a dead fish, or sea plant, macerates and dissolves in the very same water which is health and protection to a living one.

We see, therefore, why the living thing does *not* come to the land; and this is at least one step toward showing why the dead one *does*. The water *wets* the shores of the land; and, wetting them, there is an adhesion between them, and a friction when the one moves upon the other. The effects of this friction may be seen in the eddies which are formed in the loops of a river's banks, and in which the water moves contrary to the current; and also in the abrasion, or wasting away of the bank or shore when a cur-

rent sets against it. A dead substance floating in the water is wetted and laid hold of in a similar manner, and is thus at the mercy of the current. The greatest exception to this is oil, which spreads in a thin pellicle over the surface; and the effect of oil, in lessening the turbulence of waves, by diminishing the friction of the air and water, is so well known as to be proverbial.

But though the water wets, lays hold on, and is capable of carrying along the dead substance, this is not sufficient to show that a dead substance, which floats, *must* come to land, though it may in a great measure determine where the landing shall be made. Productions of tropical America, for instance, are often cast on the western shores of Britain; but no British production is ever cast on the shores of America.

The general set of the current from America to our shores explains why that which floats in the dead state, and is, in consequence, at the mercy of the current, should move along with the current: but it does not explain why the floating substance should get out of the strength of the current, and get stranded; and this, generally, in the eddy where the set of the water is the other way. We must, therefore, look somewhere else for the cause of all the wreck and ruin floating in the sea, invariably coming to land, and leaving the face of the ocean free and clear.

Where shall we look for this? It is clear that the attraction of gravitation will not answer our purpose, because the direction to the land is right across that of gravitation. It is equally clear that the common attraction of cohesion will not do, because it operates only upon substances which are nearly in contact. Electricity, magnetism, and the other peculiar modifications of attraction, chemical or otherwise, to which we are in the habit of referring pretty generally—

when we do not know very well what to say—also fail us in the explanation of this very simple fact of coming to land.

Even while we write, a theory has been broached, and supported by experiments which some of our most able investigations of the niceties of philosophy admit to be conclusive. This theory is too recent and recondite for the mass of the people yet; but the gist of it is, that there is a general attraction of cohesion in matter, of which not only all the named attractions, but gravitation itself, are merely modifications; gravitation being the modification answering to the quality of matter, without any reference to quantity or kind; and the others, the modifications arising from kind and quality. If this can be fully established, it will be a giant step in the philosophy of matter, and there are hopes, inasmuch as the researches concerning electric action appear long to have pointed to some such result as this. Still, it is rather too early to have perfect confidence.

In the meantime, we may state the coming of the broken ship to land, thus:—The water wets and lays hold of both the shore and the floating substance; and, laying hold of those, it draws them together, just as water draws itself into the openings of a sponge, or the spaces between crystal and crystal in a list of sugar. The strength of the attraction depends on the nature of the substance. It dissolves the sugar but not the sponge. A bit of wood floating in mid ocean, and the shore, stand in the very same relation to each other as the proximate parts of the sponge and the sugar. The only difference is distance, which may be a modification, but cannot be a cause. The distance is too great for the water climbing between them; but the tendency is to draw them together till they can; and so, "broken ships come to land."

BRITAIN.

CHAPTER I.

[THE multiplied and multiplying modern histories of England prove the general dissatisfaction which prevails with those which are already extant. And as we see little improvement in the new claimants to notice, and wish to put into the hands of our young men especially a more condensed and yet full history of our country than we believe has been furnished elsewhere, we propose to insert a chapter occasionally in our Miscellany, till the whole is finished—always premising that our specimens prove acceptable to our readers. We have only to add, that it is written by a gentleman who has devoted many years to the subject.]

THE BRITISH PERIOD OF ENGLISH HISTORY.

1. The very names of Britain, England, or Albion, have occasioned considerable dispute; one question being, whether its first name was Prydain, Pridania, Britain, Bretagne, Pritannia, Bretanac, Brutania, Breatin, or Brydain; and

another, whether it was called Albion from its *white* cliffs, Alben from its *high* cliffs, or Alvin from both causes united. It is the opinion of some that the name, England, first given probably by the Saxons, was anciently Englewria, Englewry, Englexhyria, Ingland, Angleland, Angleslonde, &c. And the Saxon, British, Gallic, French, Latin, Greek, German, Italian, Phenician, and many other languages, have been adduced by different advocates, as furnishing certain etymological proof; but the whole of this subject is *via deserta*.

2. Quite as various are the conjectures about the first inhabitants. Gaul, Germany, Rome, Greece, Egypt, Phenicia, have by different theorists been deemed the mother of the colony which peopled the island; but the old Britons

believed themselves to be island-born. Nothing certain is known, further than that, long before the Christian era, Britain was visited by the Phenicians and Carthaginians for its metals. Companies of them colonised Cornwall; a fact which is sufficiently indicated by many of its local names.

3. The island is supposed to have been separated by volcanic action from the continent; of which the analogous geologic qualities of the south-east coast, and that of France, are offered as proofs. At the time of the Romans it was nearly covered with vast forests; one of which, with intermissions for pasturage and towns, extended, in the south, from Kent to Somersetshire; another, in the north, covered half of Scotland; and a third included the present counties of Lincoln, Derby, Stafford, Leicester, Warwick, Northampton, and Rutland. At that period, and long after, the boar, bear, wolf, fox, several kinds of deer, of which one was very large, wild bulls, cows, distinguished for their whiteness, badgers, otters, and wild cats, were common. A powerful kind of dog, and the greyhound, are also mentioned, by the Roman writers, as peculiar to Britain. The climate, owing to the prevalence

of forest and stagnant water, was then considerably colder in winter and less heated in summer, than at present; though, subsequent to this period, the vine was cultivated in the open air, to a great extent, in the midland counties.

4. The Britons were rude, but not so barbarous as is often represented. The island, at the time of Cæsar's landing, was inhabited by more than forty distinct and hostile tribes; which necessarily retarded their mental improvement. They had above a hundred towns, of which thirty were south of the Thames and Severn. The seven tribes which occupied the country between the Humber, the Mersey, and the Thames, are thought to have had forty. Five towns belonged to the tribes which lived beyond the Severn and the Dee; and the Brigantes, who possessed the north, occupied seven or eight more. A British town, according to Cæsar, was a track of woody country, surrounded and fortified by a ditch and a mound, which secured the inhabitants and cattle. The island contained, probably, at that time, not more than 600,000 adults, at most. Of these, the following, according to Ptolemy, were the principal tribes:—

Name of Old Inhabitants.	The part they occupied.	Their chief Towns.
Atrabatii	Berkshire	Nalena, or Calena.
Belgae	Wilt, Hants, and part of Somersetshire	Venta Belgarum, Iscales, Agus, Calida.
Brigantes	From Yorkshire into Northumberland	{ Epiacum, Vinnovium, Calatum, Olicana, Caturactondium, Isurum, Eboracum, Rigodunum.
Caledonii		
Cantæ		
Cantii	Kent, and part of Middlesex	Londonium, Damenum, Ratupia.
Carei		
Carnonacæ		
Catychelani	Bucks, Beds, Herts, and Huntingdon	Salena Verulamium.
Cerones		
Coritani	{ Northampton, Leicester, Rutland, Notts, and } Derbyshire	Lindium Raga, or Rata.
Cornavii	Warwick, Worcester, Stafford, Salop, and Cheshire	Deana, or Deonna, and Viroconium.
Creones		
Damnii	Clydesdale and Lennox	{ Colonia, Coria, Lindum Vaudara, Alanna, Victoria.
Demetæ	Caermarthenshire, Cardiganhire, and Pembroke.	Luentinum, Maridunum.
Dobuni	Gloucester and Oxfordshire	Corinium.
Dumnonii	Cornwall and Devon	Voliba, Uxela, Tamara, Ica.
Durotriges	Dorsetshire	Dunium.
Epidii		
Gadeni	Tiviotdale and part of Northumberland	
Logi		
Mertæ		
Novantæ	The neighbourhood of Galloway	Lucopibia and Religionium.
Ordovices	North Wales	Mediolanum Brannogenium.
Otadeni	The north sea coast from the Tyne to the Forth	Curia Brimenium.
Parisi	East Riding, Yorkshire	Pitarria or Picarra.
Regni	Surrey and Sussex	Neomagus.
Selgovæ	Nithsdale and Annandale	Carbantorigum, Corda Tremantuem.
Silva Caledonia		
Silures	{ Herefordshire, Radnor, Brecknock, Monmouth, and Glamorganshire }	Bulleum.
Siment, or Icenii	Norfolk, Suffolk, Cambridge, and Huntingdonsh.	Venta Icenorum.
Texali		
Trinobantes	Middlesex, Essex	Camudolanum.*
Vacomagi		
Venicones		

* These names of the British towns are mostly Roman, and are perhaps oftener translations of the old British name,

than merely Latinised. This is one cause of the geographical obscurity that belongs to this period of our history.

Of these, the Belgæ, the Silures, and Trinobantes, were the most powerful; and those who lived on the sea-coast incomparably the most civilised; for they made their own clothing, wore a square plaid, and even rings on the second finger!

5. The Britons often named their towns from their rivers, on whose banks were all their cities; or from some circumstance connected with the particular spot on the banks where they stood.

In the old British, *Avon* meant a river; *Cymmer*, the confluence of two streams; *Bala*, the departure of a river from a lake; *Nant*, a brook; *Aber*, the fall of a less into a greater water; *Lhuch*, *Lach*, a lake; *Eors*, a marsh; *Rhaidr*, a cataract; *Tam*, a smaller river; *Clyde*, a stream; *Mar*, water; *Tre*, *Trev*, *Tra*, or *Tira*, signified a family or home; *Dorf*, or *Thorp*, a dwelling; all which, with a little reflection, will lead to the true knowledge of many names of places.

THE NAMES OF SOME OF THE ENGLISH RIVERS AT THAT TIME.

Old Name.	Modern Name.	Old Name.	Modern Name.
Subriana	The Severn	Abu	The Humber
Novuis	Nith	Garyenum	Yara
Deva	Dee	Idumania	Blackwater, Essex
Toisobuis	Conway	Tamessa	Thames
Tutrobuis	Tivey	Urus	Ouse
Tobuis	Towcy	Glotta	Clyde
Ratostaubuis	Wyc	Fala	Vale
Tamarus	Tamar	Dovus	Dove
Iaca	Ex	Avona	Avon
Alenus	Ax	Athesis	Tees
Roxa	Loth	Tucssa	Tweed
Finna	Eden	Trehenta	Trent
Alannus	Alno	Lindis	Witham
Vedra	Either the Were, or Tyne	Spea	Spey.

6. The form of government, as appear from Cæsar, Diodorus, Cassius, and Solinus, was monarchical; possessing as much power as the king had skill to acquire, and ability to keep. He commanded in war; with the vicissitudes of which much of his power rose and fell. The British king could do nothing without the auguries of the Druids, and the permission of the inferior chieftains. Crimes were considered as committed, not against the king, but against God; hence penalties were in the hands of the priests, and consisted of fines and excommunications. The royal revenues were slender and precarious; being part of the spoils and weapons of war, the produce of rude cultivation and of cattle, together with some obscure taxes, (from which the Druids were exempt,) and presents, which the poor were obliged to offer in order to secure protection, and the rich to avoid spoliation. These customs differed under each of the petty kings.

7. The chieftains recorded their victories, and other important events, by the erection of a stone; while the bards, who often relieved the tedium of their journeys, celebrated and inlaid them in more lasting songs; of which, according to some, there were more than a hundred kinds. The poets consisted of two orders,—the *Faids*, or religious poets; and the *Bards*, or secular poets; both of which were held in so much distinction among the Britons that they associated with nobles, and even checked the will of kings. Nor must it be forgotten that the poet was then, as in all incipient societies, the musician: for Nature of old wedded music and song together. The only instrument known then was the lyre.

8. The Silures were the first of the Britons who

bartered with foreigners: but what commerce could there have been without weight, number, measure, or money? According to Strabo, the first merchants who changed with the Britons were the Phenicians, who, 1250 B.C., passed the Straits of Gibraltar; but Bochart, and a host of inferior literati, have thought that the Cassiterides, Scilly, Cistymnydes, or Tin Isles, then ten in number, were discovered by them B.C. 904. All that is certain is, that they were known in the time of Herodotus B.C. 440 years; but their situation is not described.

9. The articles which the old British then exported were lead, tin, wool, and skins; of which the tin sold at high prices in all the chief places of the world, for, at that time, it was considered the most valuable metal! Lead was so common, according to Pliny, that the Phenicians were obliged, in policy, to keep back the greater part of what they obtained in order to advance the price of the rest. Strabo informs us that the Phenicians gave the British, in return, salt, earthenware, brass, chains, necklaces, and other trifling ornaments. After monopolizing this trade for about 800 years, the Greeks, Gauls, and Romans, (through Pytheas of Marseilles, about A.D. 330,) discovered its source. Polybina wrote a book concerning the British tin: and, for tin, says Pliny, the Indians gave their best diamonds! Afterwards the Isle of Wight,* was, according to Diodorus, the chief depository

* The space between the isle and the mainland was, at low water, dry. In the eighth century the water separating it from the coast of Hampshire was only three miles wide; now it is seven. Similar changes have taken place in respect to other British isles.

of tin; which was then conveyed, by rude Gaulish merchants, up the French rivers to various parts of the world. Such was the state of trade prior to the coming of Cæsar.

10. From the Giralduſ, we learn that the old British house (as far as ſuch a fabric could be ſaid to exiſt) was only one circular room, in whoſe centre was the fire; around which huſband and wife, parent and child, ſtranger and friend, ſlept on ruſhes; and in the top of which a hole was left for the entrance of the light, and the emission of the ſmoke.

11. The boats which the Britons chiefly uſed were made of wattles covered with ſkins—the latter article ſerving alſo for a poor ſail: from the lightneſs of their conſtruction they were capable of being carried about; while they answered ſufficiently well for ſkimming along the coaſt, from which the ignorance and fear of the generality reſtrained them from departing. Solinus ſtates, however, that the channels were often croſſed by them. Beſides which, they muſt evidently have poſſeſſed ſhips far ſuperior to theſe, for they aſſiſted the Gauliſh Veneti—theirſelves no mean ſailors for that age—againſt Cæſar.

11. The juice of woad, and of other vege-

tables, mixed with earthy ſubſtances, were uſed to ſtain, with ingenious devices, the bodies of the Britons; who, at the time of the invasion— thoſe at leaſt, in the middle and northern parts of the iſland—chiefly wore ſkins. In the ſouthern parts, however, where rude tillage and paſtorage obtained, the inhabitants often wore, in the colder ſeaſon, a rough woollen garment; which they are thought to have made with the glutinous parts of bark, and to have dyed in the glaring colours with which barbarians no ſooner become acquainted than enamoured. The Britons alſo poſſeſſed probably ſome knowledge of working the metals; of which there are not wanting modern as well as ancient indications; while their numerous urns at once decide the fact that they practiſed the potter's art. The huſbandman uſed for manure a "white marl,"—probably chalk and lime,—which Pliny affirms was ſo efficacious as to laſt ſeventy years. The granaries were ſimple ſubterraneous pits and holes in the rock. So highly, however, did agriculture come to be valued among the Britons, in proceſs of time, that the plough, as well as the place of religious worſhip, had the privilege of ſanctuary for criminals.

AUTOBIOGRAPHY.

[From the Preliminary Eſſay on Letter Writing, prefixed to the "Chriſtian Correoſpondent," an invaluable work, in three volumes, edited by James Montgomery Eſq., and published by Ball. It is a work we cordially recommend. Four hundred and twenty-three letters, written by perſons of all clafſes, on Chriſtian principles, were never before collected.]

WHEN a man undertakes to be his own biographer, he places himſelf in a very difficult and perilous ſituation. Before he can gain credit for one honourable motive, every ſinifter one that can be imagined will probably be laid to his account; and in a very few inſtances can he hope to obtain from his judges that impartiality in hearing his ſtory which they require of him in relating it. This narrow-minded jealousy ariſes from that pride of heart which almoſt every man tolerates in himſelf, and perſecutes in all beſide; it is the beam in his own eye, which, inſtead of blinding him as it ought, ſeems to quicken his ſight in ſearching out the mote in his brother's eye. This ſpecies of hiſtory, on the ground of ſome peculiar advantages which it poſſeſſes, and becauſe it is ſeldom fraught with danger, except to the author himſelf, ought to be treated with more indulgence than it generally experiences. Whatever a man ſays of himſelf is genuine; whether it be true or falſe it is equally his own. Even in hypocrisy he is no hypocrite, for deceit then is natural; if he aſſumes a virtue which he has not, he expoſes a vice which he has; if he pretends to talents which he does not poſſeſs,

he diſproves his claim by the inability with which he aſſerts it. One part of his character he may conceal, but the very act of concealment betrays another; if he cover his breaſt with both his hands, he may be ſhowing us that they are not clean; if he turns away his head to hide his face, perhaps he is diſcovering to us his baldneſs behind. Let him repreſent himſelf as he will, we ſhall ſee him more nearly as he is than any other man could have repreſented him. This conſideration alone goes far towards counterbalancing the few objections that may be urged againſt autobiography; for, practiſe as he may upon our good-nature, or preſume as he will upon our credulity, the general fidelity or falſehood of the author's own ſtatements can be more correctly aſcertained than thoſe of any ſtranger concerning him can be either eſtabliſhed or refuted.

A man's genuine autobiography, however, muſt be ſought for in his friendly and confidential correſpondence; in letters written on all kinds of occaſions, in all moods of his mind, and intended for the eyes of none but thoſe who could at once underſtand their ſlighteſt alluſions as well as their minuteſt details,—on ſubjects real, not imaginary, but which were ſpecially intereſting, congenial, or familiar to both parties, referring to their modes of life, rank in ſociety, family connexions, perſonal circumſtances;—all theſe being more or leſs illuſtrative of the language,

manners, and customs, style of conversation, state of literature, science, politics, religion, law, commerce, arts, and manufactures; in a word, the prevalent occupations, amusements, and pursuits of the people, the country, and the age to which he belonged; as well as exhibiting his own peculiar habits, tastes, and dispositions.

Letters, moreover, are side-lights to history; marginal notes or running commentaries on the universal volume of man as he is, as he was, and as he ever will be,—the same in essentials, though infinitely modified in the external manifestation of these, by the form of government and society, the degree of intelligence and virtue, or of ignorance and profligacy, under which the individuals of his species, singly or in masses, have been born and grown up to the utmost stature, which, according to their varied circumstances, they could attain, as immortal spirits dwelling in mortal bodies, during a course of threescore years and ten. How much have the annals of our own country been enlarged and enriched, within the last fifty years, from the hidden treasures of family papers, and personal memoirs of public agents in the great events of their times, composed by themselves for the use of their children and posterity? but especially, how much have those annals been elucidated by the private and even secret correspondence of such characters, which, after having been long locked up in cabinets and libraries, inaccessible to general research, have recently been given out, either in bulk to the public indiscriminately, or submitted to the inspection of enlightened men like Fox and Mackintosh, who have undertaken to rescue important portions of our national history from the discreditable obscurity, and even obloquy, under which they have been left by the negligence, prejudice, or incapacity of former chroniclers! But, if letters be thus auxiliaries to history, as history refers to man, the perpetual inhabitant of every region of the globe, they are distinct chapters in his family history; autobiographical sketches of men, individually or in companionship with others in domestic life. Princes, warriors, statesmen, patriots, philosophers, poets, artists,—people of every rank in society, every diversity of employment, and every degree of mental power and cultivation,—all, in this kind of inter-communion, show themselves of the same blood, complexion, and spirit with their countrymen and contemporaries, as well as kindred to the whole species in those general qualities which distinguish man, whether civilized or savage, from the brutes that perish. Bruce, in Abyssinia, says, "I heard the skylark singing at Massuah the same notes as in England." So man, in the abstract, speaks every where the same language, notwithstanding the confusion of Babel, and the countless multiplication of cognate, yet strange tongues, which followed the spread of the builders all over the face of the earth. The

language of the heart,—man's true mother tongue!—that is, the language of the affections, is literally translatable from one dialect into another, wherever it has been embodied in fixed vocal sounds, or their alphabetical signs. Akin to the delight and surprise which Bruce experienced, when he heard the skylark in Abyssinia singing the same notes as in England, is the pleasure which we feel, when, in bosom-intercourse with their friends, we find the venerable and the illustrious, the great and the good, among our forefathers, speaking this universal language of the heart, in our own vernacular tongue; at the same time reviving within ourselves those very emotions, enjoyments, and sympathies which were among the most precious of our own experiences, and are cherished with the most endeared of our recollections. It was not merely the unexpectedness and strangeness of hearing in a far land the song of the most common of English birds, that affected the traveller with a joy which the same notes had never awakened in him before, when he heard them every day; it was because that song, those "same notes," carried him home in the spirit to his own land, renewed the days of his youth, restored the countenances of the friends whom he had left behind, and caused him to anticipate the happy meeting which he hoped to have with them on his return; when he should sit down, in the peace of old age, on the spot where he was born, and where he hoped to be buried, beloved in life, and honoured after death, as one who had been a public benefactor, by the fruits of his labours, perils, sufferings, and discoveries. In reading the epistles of those who have been so long our elders, or were so far our superiors, we not only become more intimately acquainted with them, but more nearly allied to them; and, while we rejoice to find, that, as in the elements of our common humanity, they were in all respects like ourselves,—through the consciousness of that equality we are enabled, in no mean degree, to rise, sympathetically at least, towards the standard of their moral or intellectual pre-eminence. At the same time, such discoveries of them are well calculated to keep us humble in our own esteem; for, if the letters of the most exalted personages bring them down to our level in the ordinary affairs of life, and occasionally lift us out of ourselves towards their elevation, yet the tone and style of these unaffected compositions will always correspond with their high qualities; and passages of peculiar force will frequently elicit evidence of how far they are in reality above us in things the most excellent. Casual expressions, incidental sentiments, fall from their pens, in the fervour of spiritual communion with their dearest connexions, which reveal in a moment, and perhaps but for a moment, all the beauty or grandeur of the writer's character; like those magnanimous replies, on great emergencies, when the whole soul of a

hero or a martyr has revealed itself in a word of rebuke, admonition, or encouragement to faint-hearted attendants. Cæsar, when in imminent peril of being foundered in a storm at sea, chid the cowardice of the captain of the vessel, by exclaiming to him, "Fear not: your vessel carries Cæsar and his fortunes." Pompey, when embarking in a tempest, on a voyage to bring corn from Sicily, to supply the wants of his famishing fellow-citizens, on being urged to wait for more favourable weather, replied:—"It is

necessary that I should go, but it is not necessary that I should live." There cannot be a question which was the nobler sentiment in these two cases, though each was perfectly in keeping with the character of the man, as well as splendidly contrasting them with each other. It must, indeed, be acknowledged, that, though Pompey had here, as at the battle of Dyrrachium, the advantage of his rival, on most occasions Cæsar showed as much superiority over him as he did in the field of Pharsalia.

CHRISTIANITY.

[For the following admirable letter from Alexander Knox, Esq., to the Rev. John Jebb, we are likewise indebted to "the Christian Correspondent."]

YESTERDAY, as I was walking in the streets, I asked myself, "What is Christianity?" It is, answered my mind, a Divine system of spiritual attractions, by which, whosoever gives himself honestly to them, is effectually drawn out of the otherwise invincible entanglements, and inextricable intricacies, of this dark, miserable, polluting, heart-lacerating world, (the *αἰὼν τοῦ κόσμου τούτου*—the *ἐξουσία τῶν κοσμοκρατερῶν, τοῦ σκοταύου, τοῦ αἰῶνος τούτου*), and led forth into what David has described as "green pastures, beside the still waters;" or what Saint Paul has emphatically called *ΖΩΗ ΚΑΙ ΕΙΡΗΝΗ*, "Life and peace." The truth is, to a person of any sensibility, this world is a wretched place. There is not a step in life where we can be sure of not meeting some latent, lurking thorn; and when we fall in with those various adventurers, described by Lucretius—if they are in pursuit, they rudely shove us by; if they are in possession of their prize, they despise us in their hearts, and tell us by their looks and manner that they do so. A hard, selfish, thorough-paced mind, goes on, and cares not; but the sensible, delicate, feeling spirit, is ever pushed to the wall. To such a spirit, then, what a gentle, blessed relief is afforded, by a heart-knowledge of Christianity! There is no abatement of feeling; the vivid perception is as great as ever. But the heart and mind are so occupied, so filled, so richly compensated, and so deeply tranquillized, by the pursuit, the contemplation, the confident, affectionate, filial apprehension of God; the scripturally revealed God, Creator, Redeemer, and

Sanctifier; the incarnate God, touched with the feeling of our infirmities; and all this infinitely harmonizing, or rather identifying, with the philosophic view of the *first good, first perfect, and first fair*, while it is practically and experimentally evinced, by undeniable, invaluable, never-failing influences and effects within; all this together forms such a set-off against, and such a refuge from, the common pains and penalties of mortality, as often makes the naturally vulnerable mind rejoice in its quickness of feeling, because this serves to enhance the preciousness of the blessing.

Perhaps this view may appear to you too highly coloured. It would be so, were it to be taken as the hourly state of a Christian's mind; but all this, to its extent, is the cloudless meridian state. Many partial obscurations occur, to diminish this clearness; but they only diminish it; the substance still remains. A kind of mental rain and storm may, also, be often experienced; and the weather-beaten pilgrim may tremble to find himself driven, as he thinks, to the very edge of some dangerous precipice. But he does not fall over. He recovers his footing, and his confidence; and in a little time the sky is cleared, and the air becomes calm and genial. Amid all this, however, there is sensible progress. And this variety has its great use. In order that the mind may maintain its victory over sin, it must be kept on the alert by temptation. In order that it may continually look to Heaven for strength, it must be made to feel its own entire imbecility. And it is on the whole necessary, that nothing here should be perfect, in order to the eternal sabbatism being rightly pursued, and habitually anticipated.

RELIGIOUS DISSIPATION.

CAN, then, religion and dissipation, two things so opposite in their nature, be associated? Is it not a contradiction in terms to assume that the truly devout can be at the same time dissipated? These are questions which very naturally suggest

themselves to those of our readers who know little of the religious world, and who attach to dissipation no other meaning than that which generally obtains in their own circle. Religion, strictly speaking, is a pure and heavenly essence, which can never be

debased by an unhallowed amalgamation with the evil principles and habits of our corrupt nature. For these it has no tolerance; and it enters the heart on the express condition that it is to maintain perpetual warfare, not only with sin, but its airy shadow, its unsubstantial appearance. The imperfections and follies of religious people are not, then, to be charged upon their piety; so far as they indulge in what religion condemns, they are departing from its spirit, and furnishing an evidence against the influence, if not the sincerity, of their profession. When, indeed, their conduct and the prevailing dispositions of their hearts associate them with the world, with its maxims, and its distinguishing amusements and pleasures, whatever they may profess, their religion scarcely amounts to a name; the veil of their hypocrisy is so transparent, that it only reveals what it is intended to hide. In attributing, therefore, dissipation to the religious, we are not to be understood as intending to throw down the barrier which must ever separate the church and the world. The anomalous, or rather the amphibious creatures which seem to belong to both, who are seen one day in the sanctuary and another at the theatre, who exchange prayer-meetings for card-parties, and the Bible for the romance, are not pointed at by the subject of the present essay. They have Jacob's voice, but their hands are the hands of Esau; it is only by a too common and latitudinarian courtesy that they are denominated Christians.

But among the inconsistencies which mark a religious profession, even where there is a commendable abstinence from worldly pleasures, there is a species of dissipation of a most injurious tendency, and the effects of which are abundantly visible, especially in the metropolis, and at certain seasons of the year; to one of which we are now rapidly approaching. It is distinguishable rather as a state of mind and feeling, than by the nature of the objects by which it is elicited and confirmed. The objects in themselves are not only blameless, they are praiseworthy and excellent. To frequent the temple of God—to assist, by our presence and patronage, by our efforts and influence, the numerous benevolent and religious institutions which are at once the glory and the safeguard of our land, and which constitute Britain the missionary of the nations, and the tutelary angel of the human race, is not only innocent, but laudable, and to regard them with indifference would be to betray a total want of personal Christianity. But it is possible to “serve the gods amiss;” it is possible to lose, in the pursuit of these objects, all the advantages—as far as we are ourselves concerned—which render them valuable. It is possible to hear too many sermons, and to be so devoted to the public, as to lose all individuality in our Christian profession. There are duties enjoined by religion which we owe to ourselves, to our families, to

our pastors, and to the church with which we are more immediately connected. Whatever is inconsistent with the regular and conscientious discharge of these, though it may be good in the abstract, is, to us, an evil of no trifling magnitude. The “flying camp,” as it has been facetiously called, which is ever hovering around a new preacher, which is to be found in every place of public resort where novelty is to be seen and heard, which is always abroad and never at its quarters, is an irregular and useless appendage to that army which is led on to victory and triumph by the illustrious Captain of Salvation; they add nothing to its discipline, nothing to its success; they may seem to swell its numbers, but they encumber rather than assist; they make little progress in knowledge, and none at all in sanctity; they are, in truth, the curse of our churches, and the reproach of our common faith. These people are always hearing, but never doing: the intervals, when their example ought to shine, are wasted in languor or restless anticipation; their principles, instead of being strengthened, evaporate by constant excitement; their love to the Saviour can only be kept warm by being steeped in an azotic atmosphere; and they can be devout and benevolent only in a crowd; and when the sympathy of numbers is withdrawn they are mere religious automata, without the informing spirit or the feeling heart. This is religious dissipation; and it is indicated when the closet does not receive us as our home—when family religion is either suspended or performed in a confused and hurried manner, and when self-denial is viewed by us as an obsolete requirement of the Divine Lawgiver—when our own pastors are forsaken for the wonderful man just come up, and when the quiet and unobtrusive obligations of church-fellowship are merged in the noise and bustle of large popular assemblies.

This is an evil which is becoming infectious; and those who are free from its worst symptoms, are not wholly beyond the reach of danger. The “May meetings,” as they are familiarly termed, while they bring with them “all that I love and much that I admire,” certainly open the door to this malignant intruder; and, without great care and watchfulness, may steal from us as much as they impart. If they are attended for the mere purpose of gratification, if we go only to be pleased, without the spirit of devout supplication, which implores a blessing upon their efforts, and without a determination to favour them by our contributions, they are likely to prove fatal snares to our piety. It is impossible for the same individuals to attend them all without breaking in upon other and more imperative duties; and he is unmindful of his religious consistency who suffers himself to be drawn by them from the business of life and the spiritual interests of his own heart. It were to be wished, too, that these

meetings had in them less of ostentation, of rivalry, and of flattery; that they were conducted more in the spirit of godly simplicity; that principles were appealed to rather than the passions. It is true, that whatever is human is imperfect, and we must take the good with all its accidental evil; yet ought we to be aware of the temptations which are ready to assail us, for often where there is the least suspicion there is the greatest peril. It is not for us to impugn motives and

to judge the heart; but surely, when there are palpable indications of a frivolous spirit, and when the spiritual temple is raised amid the din of instruments and the clamours of the lookers-on as well as of the workmen, it becomes us, at least, to examine ourselves, to set a guard over our principles, and fervently to pray that we may at last enter the ark, as well as assist by our efforts in its erection.

HAIR-BREADTH ESCAPES.—No. III.

AN OFFICER'S LADY.

You will believe me when I assert that I quitted Calcutta and its neighbourhood with an aching heart. The colonel was ordered to the Mysore country, whither I accompanied him with our infant son; for soon after our arrival I had become a mother. We were at length stationed at Vellore; and to that mutiny, which was most maliciously ascribed to the influence of the Missionaries, but which arose from a totally different cause, have I to attribute my greatest earthly loss, and a train of sorrows, which, but for the sustaining power of the Gospel, would long ere this have consigned me to the grave.

On my arrival in England, I learnt with surprise and indignation, that the fanatical zeal (as the divine philanthropy of the Missionaries was contemptuously called) of a few Christians, in a very distant part of British India, and of whom the native troops in the Mysore had probably never heard, had provoked the mutiny at Vellore, and the massacre of so many of my brave countrymen. But it was not zeal of any kind that occasioned this dreadful catastrophe. It was pure absurdity. An insane order had been issued from some mysterious quarter, for altering the turban of the sepoy into something like the helmet of our light infantry, and for preventing them from wearing on the forehead the distinguished mark of their caste,—as direct an outrage of their religious customs as it would be to prohibit baptism among Christians. This was indeed a flagrant insult to their faith, an overt act of intolerance; yet with it the religion of their persecutors had nothing to do. It was a military folly—a war against turbans and toupees, and which, like most of the follies of despotism, which interfere with long-established customs and prejudices, led to very disastrous consequences.

With my beloved husband I spent nearly four years of uninterrupted felicity. Our dear Charles grew up, a lovely scion from the parent stem, and his infantile prattle often drew from his father many expressions of tenderness which suffused my eyes with tears of joy. Our affections flowed, and mingled towards this object of mutual endearment. I was too happy.

The last evening we ever spent together was one of peculiar satisfaction. We conversed of England—happy England; and by a natural transition, our minds were carried upwards to that better country—the Christian's heaven—the Christian's home. The Bible lay before us, and I read the last chapter of the Revelations. We then knelt down, and my husband offered up a prayer remarkable for its calm solemnity and fervour. With pathetic earnestness he prayed for me, and our little boy. It was love, conjugal, paternal love, heightened and hallowed by a sublime and exquisite devotion. As we rose, I pressed his hand to my heart with a rapture which I never felt before; nor shall I feel it again till I behold his welcoming smile on the shores of immortality.

About nine o'clock we retired. At two in the morning we were awakened by a loud firing. The colonel hastened to the window, which was open, and demanded from the crowds of sepoy that were assembling at the main guard, the cause of the disturbance. No answer was returned; but the rapid continuance of the firing left us in no doubt of the perils which threatened us. I had not power to articulate, and I dreaded, even by a look, to agitate my husband, whose countenance, I perceived, was already pale and troubled. With his characteristic coolness and self-command, he wrote a note to be forwarded to Arcot for reinforcements; and gently urging me to seek safety in my chamber, he rushed into the thickest of the danger, hoping by his presence to reclaim the less desperate to a sense of duty, and either to vanquish the others, or to bring them to terms.

Instinctive terror induced me to close the doors of my apartment, and to seek for my child and attendants the best retreat in my power. I endured two hours of excessive alarm. The thunder of the cannon, and the loud volleys of the musketry, which, with alight intervals, continued till four o'clock, shook my nerves, and I almost died with apprehension. Once, when the firing ceased at the main guard, I imagined that I heard the footstep of my husband.

I ran to the door, but before I could open it he was gone. New dangers awaited him at the European barracks, where the conflict was renewed, and where the disaffected were making their last, desperate struggle. It was too successful, and in a few moments a scene of dreadful carnage and plunder ensued. I had ventured twice from my apartment down to the hall, to ascertain, if possible, the fate of my husband. The last time, as I stood in a situation open to the veranda, a figure approached me, and a flash from a distant musket discovered to me a military uniform. I trembled for my safety, and that of my dear infant. I had courage, however, to ask, who was there? The reply was—"I am an officer of the mainguard—my brave comrades have all been murdered—the rebels are advancing—fly for your life!" I rushed back to my chamber, but, before I could reach it, this unfortunate man experienced the doom of his companions. He was cruelly butchered in Colonel Wilmington's* dressing-room. Every moment increased the horror of my situation. Daylight revealed a shocking spectacle. The parade was covered with soldiers of the sixty-ninth regiment lying dead. Sepoys were running in all directions, shouting and yelling with the ferocity of demons. Some, with savage brutality, were insulting the remains of their hapless victims; while others, intoxicated with success, were ransacking the houses, intent only on rapine and murder. At this moment I gave up all for lost. My husband's miniature was in the drawer of my dressing-table. I took it with convulsive agony and placed it in my bosom. It was an involuntary act of tenderness. I was resolved to retain his dear image even in death. Scarcely had I indulged this pardonable weakness, ere a loud noise in the hall, adjoining my bed-room, announced the crisis of our fate. I moved softly, and looking through the door, discovered two sepoy's beating our furniture to pieces. At the suggestion of my Ayah, we concealed ourselves beneath the bed. Scarcely had we taken this precaution ere the door was forced, and shots poured into the apartment. I have now in my possession a ball which fell close to me, and had nearly proved fatal to my child.

With the energy of despair, I resolved to make a desperate effort to save our lives. With my Charles in my arms, and the women following me, I presented myself from the back staircase to the sepoy's who were on guard. It was a mother's appeal, the appeal of holy nature in its last extremity, and, though made to the hearts of barbarians, it was not in vain. We were permitted to seek refuge in the stables: here we had not been five minutes when we were visited by a sepoy, whom I instantly recognised as a man to

whom the Colonel had shown many little acts of kindness, and who had manifested an unusual attachment to our darling son. He looked fearfully round, as if apprehensive of being discovered, and whispered to me in hurried accents to escape, pointing at the same time to a fowl-house, which had a bamboo front, as the only asylum. I objected, that there we should be exposed to the view of our enemies. However, I deemed it prudent to follow his suggestion, and he kindly covered our hiding-place with a large mat, and furnished my little Charles with half a loaf of bread, which he greatly needed. Here, famished with thirst, and full of the most dreadful apprehensions, I continued another three hours, every successive moment of which augmented my terror, lest the screaming of my poor boy, who was alarmed at the firing, should reach the ears of our bloodthirsty foes, and allure them to the spot. Through an aperture I distinctly saw my house plundered, and frequently was chilled with horror when I heard the enraged murderers repeat my name, and threaten me with instant death.

But amidst all these horrors, fears for myself were absorbed in anxiety for my husband. I dreaded to hear of his assassination, and I really believe I should have braved death, and searched for him on the parade, had not the situation of my babe withheld me from the rash attempt.

Exhausted by fatigue and terror, nature was just sinking under the accumulating pressure, when the tremendous roar of cannon at the gates roused my attention, and inspired me with hope. What I conjectured proved to be true: the nineteenth dragoons, from Arcot, had arrived. My heart beat violently, and I almost fainted with the sudden emotion as I heard the trampling of their horses on the drawbridge, and the welcoming huzzas of the garrison. Still I was afraid to leave my place of concealment. My name was repeatedly called, but I knew not whether it was a friendly or a hostile voice; till perceiving several British officers, I imagined that one of them was my husband, and instantly sprang forward to meet him. But, alas! it was a sad illusion. In an agony of suspense I looked round on all the group, but he was not there. They first told me he was wounded. In mercy they would have deceived me, but my prophetic soul too surely foreboded the heart-appalling fact—I was a widow, and my babe an orphan: so soon passed away my dream of happiness.

Inconsolable at my loss, I could not pray; even the resources of piety seemed to fail; I felt as if utterly forsaken, and almost questioned the oracular assurance of my dying father. I was a stranger in a strange land. My hopes were withered, and there were no dews of heaven to refresh them; no fostering hand gently to raise them upon their bruised stem; no sunshine to restore their fragrance and their beauty. They

* The real name may be found in the journals of the time.

were crushed, and my poor, weak heart was crushed with them. Grief is scarcely grief that is relieved by the luxury of tears; I could not weep; I have no doubt there was impiety in this sorrow. It was a virtual arraignment of the wisdom and mercy of Providence; it was charging God foolishly; and in this consisted its bitterness. If Divine faith had not been obscured, and almost annihilated, my calamity would have been great; yes! with all the supports of religion I could scarcely have borne it. The infusion of despair made it intolerable. Alas! it was the hour and triumph of weakness; it was nature subduing principle: but God was merciful. I fled from him into the deep recesses of my woe, but there, where I endeavoured to avoid, I found him. The chastising rod dropt from his hands, and he said unto me, "Live!" In the extremity of my anguish his compassion visited me.

All the relief which sympathy and kindness could afford, I experienced from my friends: my

sex, my loss, the delicacy of my situation, conspired to ensure me the tenderest offices of humanity, even from strangers; but it was the sacred page, the promise of strength according to my day, the light of salvation irradiating the gloomy path of adversity—it was this which supported and cheered my heart. Now I learned to appreciate the value of Christian principles, and the incomparable excellence of the Holy Scriptures. Under this, the heaviest calamity of my life, I experienced their mighty efficacy. When at ease, and enjoying all the comforts of life, I could only speculate on this efficacy, or believe it on the testimony of others. Now, I knew it for myself; speculation became confirmed persuasion, and faith arose to assured certainty. Thus the advantages of my affliction greatly counterbalanced its suffering, and I was taught in the sad school of adversity. It came in darkness and in terror, but before the glorious beams of heavenly hope it melted into a thousand forms of beauty.

MAY.

WELCOME, welcome, once again,
With thy bright and beauteous train;
Queen of sunshine and of flowers,
Goddess of the roseate hours,
In thy golden chariot come,
From thy fair and distant home,
Where the nightless scenes arise,
Far beyond the deep blue skies;
Girt with robes of radiant hue,
Light as morning's filmy dew,
While the wreaths of roses fair
Twine around thy sunny hair,
And upon thy forehead shine
Glittering gems of hues divine.

Trees, with dress of living green,
Welcome thee, their sylvan queen;
And along the smiling plain
Birds awake their vernal strain,
While th' echoing hills reply
To their pleasant minstrelsy.
Brightly now the summer beam
Dances on the sparkling stream,
Flowing softly, murmuringly,
Where the willows sadly sigh,
And the flowers look up and smile,
Gladdening in that light awhile;
Primrose pale and violet fair
Fling their fragrant incense there;
Cowslips shine with modest pride
On that streamlet's grassy side,
And the wild rose in its bloom,
Scatters round its rich perfume.

Village maids, as evening comes,
Gaily hie from cottage homes,
Tripping fast to daisied green,
Where the rustic virgin queen
Holds her high and sovereign court,
While her subjects round her sport;
And, as mirthful music plays,
Whirl along the dizzy maze.
Wrinkled care, with leaden eye,
Darkened brows, and blighting sigh,
May not in that train appear,
Breathing sullen sadness there.
Smiles are brightening every face,
Ills to mirth have given place,
Pleasure rules the laughing throng,
Pleasure wakes the joyous song;
Heart with heart, and hand in hand,
Lightly trip that happy band;
Or beneath the green-wood shade
Walk the swain and blue-eyed maid,
Whispering low the tender tale
"While the evening shades prevail,"
And the moon, through glancing boughs,
Hearkens to their solemn vows,
And with chaste and holy light,
Breaks the gloom of silent night.

Welcome, welcome, with thy train
Fair and smiling; may thy reign
Be of gladness and of flowers,
Sunny skies and laughing hours.
Happy, then, thy gentle sway,
Child of summer! blooming May! T. W. A.

CHRISTIANITY THE ONLY PREPARATION FOR DEATH.

No one will deny that death is an object of reasonable dread and apprehension. The terror with which this opprobrium of our nature is invested is made up of various appalling elements. Death is undoubtedly an object of instinctive aversion to every creature capable of feeling; but he is properly an object of terror to man only. Whence arises this?

In the first place, assuredly from the original superiority of his nature and destiny, which placed him above the control of death; and, as the thinking immortal principle still remains in him, its enforced and *unnatural* association with that which is its *natural* antipathy, its eternal contrariety, must inspire him with agonising sensations whenever it is realized. On this

account, man alone, among the creatures of this mortal world, is surprised with miserable pain, the soul's forebodings of indefinable horror, when death shakes over him his dreadful dart. The flowers rise, blossom and perish; they emit their life in dying fragrance, and there is no terror in the departing loveliness. The creatures endowed merely with life and instinct, bow to inevitable fate, but there are no premonitions to alarm them. They feel the pang of nature, but not of mind: it is momentary, and then follow the undisturbed repose, the slumbers of eternal rest. Not so with man. That which arms Death with his greatest terror is, what we know and what we do not know on subjects of infinite moment to our well-being and happiness. In one word, our knowledge and our ignorance equally awakens in our souls the most appalling dismay, when we think of ourselves as creatures, dependent, accountable, sinful, and dying. On all these points our knowledge and ignorance are strangely blended, and leave us nothing to hope, but every thing to dread. I know that I am a creature, but I know not why I am created, nor by whom. I know that my life and destiny, however they may be connected, and whatever consequences they may involve, are in the hands of another; but I know not whether it is Providence, or chance, or fate. I know that I am accountable, for I have an inward consciousness of good and evil, of right and wrong, of virtue and vice, of piety and irreligion; yet on every one of these interesting subjects I am strangely ignorant. I transpose and confound them, and have no clear apprehension of their specific and characteristic distinctions. I know that, as an accountable creature, I am depraved and guilty; that I am in a state of misery,—the consequence of the moral disorders with which I am infected and surrounded. But I am ignorant of a remedy: I know not that I can be pardoned—I feel that I deserve to be condemned: but whether retribution be in this life, or whether in a life to come, or whether there be a future life, and whether there I shall suffer punishment, and whether that punishment will be temporary or eternal, I am totally uninformed. But, in connexion with the certainty of death,—with my natural dread of annihilation, and the instinctive revolting of my heart from the idea of a judgment of which I have awful and undefinable impressions, my ignorance gives a terrible preponderance to anxiety and fear, and death concentrates in itself all the horrors which a soul can endure while united with a body which is likewise doomed to suffer the unutterable pang. Now, it may be important to inquire, how all this is met by those systems which either do not recognise or which reject Christianity?

Philosophy, as it is called, cannot advance us a single step: it may increase the vividness of our perceptions, and strengthen our convictions as to the truth of all we know, but it can add nothing new. It cannot lift up the veil and remove our ignorance. It can offer nothing to allay our fears, nothing to mitigate the real terrors of death. But it will be said that, among the philosophers of the ancient world, and their followers, almost innumerable instances occurred of tranquil, and even triumphant, dissolution. But, in the majority of these cases, it must be admitted that hope, in the true and proper sense of the term, did not form an ingredient; or, if it threw any cheering influence over the spirit, it was founded on ignorance, and was therefore no better than unreasoning presumption. A human being, wholly unconscious of spiritual subjects, unacquainted with his own immortality, with the nature of God and himself, and his aggravated offences against his Creator, and with the awful retribution which his offences deserve, may die at ease, because he dieth as the fool dieth. Amongst persons of this class, the best and most enlightened individuals of the heathen world must be included,

and their repose in death, the tranquillity which they felt and displayed, is a totally different thing from the peace which pervades the bosom of the dying Christian. In many cases it was mere apathy, proceeding from a mind disciplined to an unnatural persuasion that insensibility was the highest virtue; in many more, it was mere dissatisfaction with life; in others, an entire disbelief of the reality of the state on which they were about to enter; and, in some, the resignation which flowed from the desire of being released from excessive pain. The deaths of which I am now treating, likewise differ essentially from the peaceful departure of Christians in this,—that, in the one case, the passive virtues alone are summoned to the task of bearing the weight of unavoidable evil; in the other, there is not only submissive endurance, but positive enjoyment,—the bitterness is not only neutralized, but a sweetness is actually infused into the cup of mortality.

While philosophy is thus confessedly an insufficient qualification for a conquest over the last enemy, it will be found that superstition, and false religions, the inventions of men, have been equally powerless in assisting them to dispel the terrors of death. Superstition (and in this term I include every species of idolatry that has at any time obtained in the world) is indeed the creature of human fear, invented for the sole purpose of annihilating that fear, by imaginations the most vile, principles the most atrocious, and actions the most diabolical. Thus, in every age, and among all nations where it prevails, it obliterates and destroys all that is great, holy, and divine in the universe, for the purpose of deceiving the soul into a fallacious confidence in the hour of death.

Infidelity undertakes to conquer the king of terrors, and by a method exclusively its own. With what success we may easily ascertain by considering the nature of the process which it employs, and its general effect upon its votaries when its principles are brought to the test. To insure peace in death, infidelity endeavours to divest sin of its turpitude, and thus offers the greatest violence to the conscience,—to extinguish in the soul its natural longing after a future state; and thus the dread of falling into nought is left to operate with all its power, as simply more tolerable than an apprehension of impending retribution. But infidelity is the most treacherous, as well as the most daring, enemy of man. How often does it take off its mask, and reveal its real character to its victim, in the hour of his utmost need, in the moment of his greatest peril? There may be some few instances among unbelievers of an apparent superiority to the anxieties and sorrows of death; but I confess I have never met with any well-authenticated case. Where, on any occasion, it has been pretended or paraded, it has been nothing more than an affected composure, proceeding from an arrogant wish to make the last act of life confirm its preceding professions; or it has been the vanity of perpetuating a philosophic character the ruling passion strong in death; or the pride of not retracting sentiments which, from pride, had been maintained,—the desire of posthumous renown among their own party,—the hope to make their disciples stand firm by their example,—ambition to give their last possible blow to revelation,—or, perhaps, the fear of expressing doubts which might beget a suspicion that their disbelief was not so sturdily as they would have it thought. Above all, might they not, as a punishment for their long neglect of the warning voice of truth, have been given up to a strong delusion to believe the lie they had so often propagated, and that they really expected to find in death that eternal sleep with which they had affected to quiet their own consciences, and had really weakened the faith of others? Tranquillity and infidelity are not natural allies, and

in death they cannot meet. For if we suppose that the infidel wavers, and that scepticism places him in equilibrio between the opposite decisions of faith and unbelief, what terrifying apprehensions must be the consequence! That religion he has so wantonly impugned may, after all, be true; that Jesus whom he has blasphemed, may, after all, be the Son of God; and that hell that he so often despised as a figment of the brain, may turn out to be no less than an everlasting reality. But let us take another supposition—that the unbeliever possesses, in his own mind, a full assurance of the truth of his principles: this very assurance must greatly augment the natural terrors of death. If infidelity be true, then this life is our only possession—this world our all. We must, to be consistent with ourselves, set an infinite value upon both; on these principles death comes to rob us, not only of life, but of being. But infidelity changes its character in the dying hour. It flatters its votaries till they find themselves in the presence of the king of terrors, and then their false friend laughs them to scorn, and departs, leaving them to the faith of despair—the faith of demons, who believe and tremble. One exclaimed, struggling in death, "That there is a God I know, because I feel his wrath; that there is a hell I am certain, having received the dreadful earnest of my inheritance there." The late excellent Bishop Porteus has remarked, that "the writings of Voltaire have unquestionably produced more infidels among the higher classes, and spread more general corruption over the world, than all the voluminous productions of all the other philosophers of Europe put together." And mark the end of this man. "It is stated," continues the Bishop, "as a well-authenticated fact, that the nurse who attended him on his death-bed, being soon after called to attend another person in dying circumstances, eagerly inquired whether this person was a philosopher, (that is, an infidel,) assigning as the reason of her inquiry, that she had suffered so much, had been so greatly terrified by the extreme dread and horror which Voltaire had expressed, that she was determined to attend no one who was not a Christian. There was much effort to conceal the agonies of his mind from the knowledge of the world; but the effort was vain. His last words are said to have been, 'I am abandoned by God and man.'" Hobbes died like a true sceptic. Is it not a comfortable confession, uttered in the immediate prospect of dissolution?—"I give my body to the dust, and my soul to the great *Perkaps*. I am going to take a leap in the dark."

All those instances, in the hour of death, of a confirmed, or rather undisturbed, state of mind, separate and apart from religious consolations, known and avowed by the soul in the full possession of its faculties, must be resolved into ignorance, or stupidity, or hardened unbelief, or the influence of opiates. This tranquil mode of dying is no evidence of safety. A man walking upon a precipice is not secure because he is ignorant of his situation; but this ignorance keeps him easy, and laughing, and singing, till he falls off. And thus we are told of the wicked, that "they have no bands in their death, and their strength is firm."

The levity of Hume, or his philosophic equanimity, as it has been called by his friends, is a case which makes sadly against his cause, and those who take an interest in its success. A writer in the "Eclectic Review" at the time when Ritchie's "Life of Hume" first made its appearance, so completely exposed this dying scene, that we have heard little of it since. I cannot conclude this article with a more apposite quotation than from this admirable critique. Speaking of the indifference to life and to all existence which the

author of the *Essays* which teach scepticism as a science betrayed on this solemn occasion, the reviewer proceeds—

"First. Supposing a certainty of the final cessation of conscious existence at death, this indifference to life, if it was not affected, (which, indeed, we suspect it to have been, in part,) was an absurd undervaluation of a possession which almost all rational creatures that have not been extremely miserable have held most dear, and which is, in its own nature, most precious. To be a conscious agent, exerting a rich combination of wonderful faculties—to feel an infinite variety of pleasurable sensations and emotions—to contemplate all nature—to extend an intellectual presence to indefinite ages of the past and future—to possess a perennial spring of ideas—to run infinite lengths of inquiry with the delight of exercise and fleetness, even when not with the satisfaction of full attainment—and to be a lord over inanimate matter, compelling it to an action and an use altogether foreign to its nature—to be all this, is a state so stupendously different from that of being simply a piece of clay, that to be quite easy and complacent in the immediate prospect of passing from the one to the other, is a total inversion of all reasonable estimates of things; it is a renunciation, we do not say of sound philosophy, but of common sense. The certainty that the loss will not be felt after it has taken place, will but little soothe a man of unperverted mind, in considering what it is he is going to lose.

"Second. The jocularity of the philosopher was contrary to good taste. Supposing that the expected loss were not, according to a grand law of nature, a cause for melancholy and desperation, but that the contentment were rational; yet the approaching transformation was, at all events, to be regarded as a very grave and strange event, and therefore jocularity was totally incongruous with the anticipation of such an event: a grave and solemn feeling was the only one that could be in unison with the contemplation of such a change. There was, in this instance, the same incongruity which we should impute to a writer who should mingle buffoonery in a solemn crisis of the drama, or with the most momentous event of a history. To be in harmony with his situation, in his own view of that situation, the expressions of the dying philosopher were required to be dignified; and if they were in any degree vivacious, the vivacity ought to have been rendered graceful, by being accompanied with the noblest efforts of the intellect, of which the efforts were going to cease for ever. The low vivacity of which we have been reading, seems but like the quickening corruption of a mind whose faculty of perception is putrefying and dissolving even before the body. It is true that good men of a high order have been known to utter pleasantries in their last hours; but these have been the pleasantries of a fine ethereal quality,—scintillations of animated hope,—the high pulsations of mental health,—the involuntary movements of a spirit feeling itself free even in the grasp of death,—the natural springs and boundings of faculties on the point of obtaining a boundless liberty. These had no resemblance to the low and laboured jokes of our philosopher; jokes so laboured as to give strong cause for suspicion, after all, that they were of the same nature, and for the same purpose, as the expedient of a boy passing through some gloomy place in the night, who whistles to lessen his fear, or to persuade his companions that he does not feel it.

"Third. Such a manner of meeting death was inconsistent with the scepticism to which Hume was always found to avow his adherence; for that scepticism necessarily acknowledged a possibility and a chance that the religion which he had scorned might, notwithstanding, be found true, and might, in the moment after his death, glare upon him with all its terrors. But how dreadful to a reflecting mind would have been the smallest chance of meeting such a vision! Yet the philosopher could be cracking his heavy jokes, and Dr. Smith could be much diverted at the sport.

"Fourth. To a man who solemnly believes the truth of revelation, and therefore the threatenings of Divine vengeance against the despisers of it, this scene will present as mournful a spectacle as perhaps the sun ever shone upon. We have beheld a man of great talents and invincible perseverance, entering on his career with the profession of an impartial inquiry after truth, met at every stage and step by the evidences and expostulations of religion and the claims of his Creator, but devoting his labours to the pursuit of fame and the promotion of impiety, at length acquiring and accomplishing, as he declared himself, all he had intended and desired, and descending toward the close of life amidst tranquillity, widely extending reputation, and the homage of the great and learned. We behold him appointed soon to appear before that Judge to whom he had never alluded but with malice or contempt; yet preserving to appearance an entire self-complacency, idly jesting about his approaching dissolution, and mingling with the insane sport his references to the fall of "superstition"—a term of which the meaning is hardly ever dubious when expressed by such men. We behold him at last carried off, and we seem to hear, the following moment, from the darkness in which he vanishes, the shriek of surprise and terror, and the overpowering accents of the messenger of vengeance! On the whole globe, there probably was not acting, at the time, so mournful a tragedy as that of which the friends of Hume were the spectators, without being aware that it was any tragedy at all."

THE REVIEWER'S TABLE.

The Christian's Daily Treasury: containing a religious exercise for every day in the year, by EBERNEZER TEMPLE, has led us to the reflection that this is not only the age of inquiry, but, if we may judge from the numerous devotional manuals which are daily issuing from the press, the cause of genuine piety is also on the advance. Mr. Temple has furnished his quota to the general stock. "The Christian's Daily Treasury" will enrich many a heart, and cheer the pilgrim on his way to heaven. Here is food for a year, and it is better than the manna, it is—in a nobler sense—"angels' food," and will bear keeping. It may be repeated day after day, and for many a year, and will be ever fresh; out of this treasury we may draw things new and old.

Pastoral Appeals on Conversion; by the Rev. CHARLES STOVEL, is filled with scriptural sentiments and searching appeals; but we wish Mr. Stovel would cultivate a more correct taste, and aim less at originality.

RANSOM'S Temptation: a Treatise on Satanic Influence; is a small but excellent work, worthy of being

ranked with the best theological treatises in our language.

Stevenson's Sacred History, from the Creation to the Death of Asa; is well worthy the attention of all, especially of the young. It is to be followed by a second part, but was it really desirable to divide the work? We naturally wish for the remainder.

The Cedar Fallen, a Piece of Music; by Mr. JOHN KING, occasioned by the death of Dr. Rippon, is well composed, and very correct in its harmony.

We have read with pleasure *Original Hymns, intended to be sung at the Public Meetings and other Services of Temperance Societies*. By JOHN BULMER. Second Edition. Sold by Jackson and Walford.—We hope that these hymns will answer the pious purpose of their esteemed author. The notes are a valuable and useful addition.

The Dreadful Requisition; or, a Treatise on God's Righteousness in Punishing the Neglect of Souls. By the Rev. C. STOVEL, is worthy of its great subject, and has our cordial commendation.

MEN AND THINGS.

ST. ROCHE.—We give the following article relative to a Catholic saint, merely to show what some men believe.

All that Butler can affirm of him is, that, making a pilgrimage from Montpelier to Rome during a pestilence, he devoted himself to the sick, became infected, made a shift to crawl into a neighbouring forest, bore incredible pains with patience and joy, returned to France, practised austere penance and piety, and died at Montpelier.

In the "Golden Legend" he is called St. Rock, and it relates that when infected by the pestilence, and lacking bread in the forest, a hound belonging to one Gotard daily took bread away from his master's board, and bare it to Rock, whom Gotard thereby discovered, and visited, and administered to his necessities; wherefore the hound came no more; and Rock was healed by revelation of an angel; and with touching and blessing he cured the diseased in the hospital, and healed all the sick in the city of Placentia. Being imprisoned, and about to die, he prayed that he might live three days longer in contemplation of the Passion, which was granted him; and on the third day an angel came to him, saying, "O Rock! God sendeth me for thy soul; what thou now desirest thou shouldest ask." Then St. Rock implored that whoever prayed to him after death might be delivered from pestilence; and then he died. And anon an angel brought from heaven a table, whereon was divinely written in letters of gold, that it was granted—"That who that calleth to Saynte Rock mekely, he shall not be hurte with ony hurte of Pestylence;" and the angel laid the table under Rock's head; and the people of the city buried St. Rock solemnly, and he was canonized by the pope gloriously. His life in the "Golden Legend" ends thus: "The feast of Saynte Roche is always holden on the morowe after the daye of the assumpcion of our lady, whiche life is translated out of latyn in englysshe by me, William Caxton."

There is an entry among the extracts of the churchwardens' account of St. Michael, Spurrier-gate, York, printed by Mr. Nichols, thus: "1518. Paid for writing of Saint Rokey Masse, 0l. 0s. 9d."* His festival on this day was kept like a wake, or general harvest-home, with dances in the churchyard in the evening.†

The phrase, "sound as a roach," may have been

derived from familiarity with the legend and attributes of this saint. He is esteemed the patron saint of all afflicted with the plague, a disease of common occurrence in England when streets were narrow, and without sewers, houses without boarded floors, and our ancestors without linen. They believed that the miraculous interposition of St. Roche could make them as "sound" as himself.

There is a rare print of this saint, with an angel squeezing the wound, by D. Hopfer.—*Hone's Every Day Book*.

HYPOCHONDRIACISM.—The most melancholy record of the miseries of hypochondriacism is to be found in the diary of Dr. Walderstein, of Göttingen. He was a man much deformed in person, and his mind seemed as distorted as his body. Although of deep learning and research, and convinced of the absurdity of his impressions, yet he was unable to resist their baneful influence. "My misfortune," says the doctor, "is, that I never exist in this world, but rather in possible combinations created by my imagination to my conscience. They occupy a large portion of my time, and my reason has not the power to banish them. My malady, in fact, is the faculty of extracting poison from every circumstance in life; so much so, that I often felt the most wretched being because I had not been able to sneeze three times together. One night when I was in bed I felt a sudden fear of fire, and gradually became as much oppressed by imaginary heat as though my room were in flames. While in this situation, a fire-bell in the neighbourhood sounded, and added to my intense sufferings. I do not blush at what might be called my superstition, any more than I should blush in acknowledging that my senses inform me that the earth does not move. My error forms the body of my judgment, and I thank God that he has given it a soul capable of correcting it. When I have been perfectly free from pain, as is not unfrequently the case when I am in bed, my sense of this happiness has brought tears of gratitude in my eyes. I once dreamt," adds Walderstein, "that I was condemned to be burnt alive. I was very calm, and reasoned coolly during the execution of my sentence. 'Now,' said I to myself, 'I am burning, but not yet burnt; and by-and-bye I shall be reduced to a cinder.' This was all I thought, and I did nothing but think. When, upon waking, I reflected upon my dream, I was by no means pleased with it; for I was afraid I should be.

come all thought, and no feeling." It is strange that this fear of thought assuming a corporeal form in deep affliction, had occurred to our poet Rowe, when he exclaims, in the "Fair Penitent," "Turn not to thought my brain." "What is very distressing," continues the unfortunate narrator, "is, that when I am ill I can think nothing, feel nothing, without bringing it home to myself. It seems to me that the whole world is a mere machine, expressly formed to make me feel my sufferings in every possible manner." What a fearful avowal from a reflecting and intelligent man! Does it not illustrate Rousseau's definition of reason—the knowledge of our folly?—*Millengen's Curiosities of Medical Literature*.

A REMARKABLE INCIDENT.—In the beginning of 1815 a circumstance took place which excited much interest in Paris. A surgeon in the army, named Dautun, was arrested at a gambling-house in the Palais Royal, on the testimony of a scar in his wrist. Some time previous, the officers of the night had found, while passing their rounds in the different parts of the city, four parcels tied up. One contained the head, another the trunk, a third the thighs, and a fourth the legs and arms, of a man. In the teeth, tightly compressed, was a piece of human flesh, apparently torn out in the dying struggle. The parts were collected, and put together in their regular order, and exhibited for a number of days at the Morgue. The mystery which involved this dark transaction excited quite an interest, and numbers went to behold the corpse. The general and only conviction was, that he must have been murdered; but for a number of weeks no clue was obtained to elicit information on the subject. When it became improper to keep the body longer above ground, a cast in plaster was taken, fully representing the murdered victim, and this remained a much longer time for the public to see. At length Dautun happened to be engaged in gambling at the Palais Royal. He played high and lost. Calling for liquor to drink, and angry because the waiter was somewhat tardy, when he came with it, Dautun emptied

the glass, and threw it at the waiter. It was shivered into a thousand pieces, and a fragment was carried into Dautun's wrist, under the cuff of his coat. The spectators gathered around, and, learning the accident, wished to see the gash: he drew down his sleeve, and firmly pressed it round his wrist; they insisted on seeing it, he obstinately refused. By this course the bystanders were at length led to suppose that something mysterious was involved in this conduct, and they determined at all events to see his wrist. By force they pushed up his sleeve, and behold a scar, recently healed, as if made by tearing out of flesh, appeared. The landlord had been at the Morgue, had seen the murdered man with the flesh between the teeth, and it struck him in a moment that the flesh was torn from this man's wrist. Charging them to keep him safe, he hastened to call in the legal authorities, and arrested him.

In the event, Dautun confessed that, being quartered at Sedan, and out of money, he came to Paris to try some adventure. Knowing that his brother had a large sum by him, directly on his arrival he went to his lodgings in a retired part of the city, about eight in the evening. He entered the house, unnoticed by the porter, and passing to his apartment, found his brother asleep. He immediately commenced his work of death: his brother waking up defended himself, but in addition to the surprise and horror of the moment, being in a feeble state of health, all the desperation of his struggle was overpowered. In the scuffle he tore out the flesh. Being killed, the surgeon cut up the body, tied it up in four parcels as before-mentioned, secured the money, and retired.

He also confessed that, eleven months previous, he had murdered an aunt, who was living with a second husband, to obtain money. Her husband was arrested, and imprisoned for a number of months; but as nothing appeared to criminate him, he had been discharged. The writer saw the unhappy fratricide on his way from prison to the place of execution.—*Zerah Colburn's Memoirs*.

GEMS.

ANTIQUARIAN ENTHUSIASM.—The following anecdote is related in Nichols's "Illustrations of Literature," upon the authority of Mr. Dallaway, vol. iii. p. 727. Upon the receipt of a letter at Townley, from Mr. Jenkins, the then English banker at Rome, promising him the first choice of some discovered statues, Mr. Townley "instantly set off for Italy, without companion or baggage; and, taking the common post conveyance, arrived *incognito* at Rome, on the precise day when a very rich cava was to be explored. He stood near, as an uninterested spectator, till he perceived the discovery of an exquisite statue, little injured, and which decided his choice. Observing that his agent was urgent in concealing it, he withdrew to wait the event. Upon his calling at Mr. Jenkins's house in the Corso, who was not a little surprised by his sudden appearance, the statue in question was studiously concealed, while the other pieces were shared between them with apparent liberality. Mr. Townley remonstrated, and was dismissed with an assurance that, after due restoration, it should follow him to England. In about a year after Mr. Townley had the mortification to learn that the identical young Hercules had been sold to Lord Lansdowne at an extreme, yet scarcely an equivalent, price." This transaction must have occurred some time before 1790. It was in that year that the Hercules was sold by Mr. Jenkins to Lord Lansdowne. A different story is, however, told of this Hercules in the account of it in the first *Dilettanti* volume, pl. xl. Mr. Townley is there stated to have had the choice of the two statues at the time they were discovered; to have fixed from

description, but afterwards to have repented of his choice.

THE CONSERVATORS OF TRUTH.—Heresies have seldom or never taken their rise from the mass of the people. Look at the history, trace the origin, of the principal corruptions of Christianity that have prevailed at different periods, and you will uniformly find that they commenced in the higher classes, among men of leisure and speculation; that they were the product of perverted ingenuity and unsanctified talent. Adopted to subvert the purposes of avarice and ambition, they were the invention of spiritual wickedness in high places. The commonality, tenacious of the habit of thinking and acting as they have been trained, are slow in adopting novelties, and the last to be misled by the illusions of hypothesis, or the false refinements of theory. Let but the great body of the people be enlightened by the word of God, let them comprehend its truths, and imbibe its maxims, and they will form the firmest bulwarks against every erroneous and delusive system. It is in a virtuous and enlightened population, and especially in a yeomanry and peasantry informed and actuated by the true spirit of religion, we look for the security and preservation of its best interests. It was among them that Christianity commenced its earliest triumphs; among them the reformation, begun by Luther, found its first and latest friends; as it was in this department of society our holy religion first penetrated. Should the time arrive for its disappearance in other quarters, it is here that it will find its last and safe retreat.—*Robert Hall*.

LIVINGSTON'S SYSTEM OF PENAL LAW IN THE STATE OF LOUISIANA.

CHAPTER I.

AMERICA is the world of progress. Social humanity there develops its energies, without being counteracted or misdirected by antiquated institutions based by tyranny on popular ignorance. Hers has been an onward course. Old edifices she has not had to pull down before she could raise her own fabric of society; she has had little to unlearn; and, to guard her against constructing systems fatal to her national happiness and prosperity, Europe exhibits a thousand beacons to warn and to instruct her. In common with all the friends of justice, we hail the "System of Penal Law for Louisiana," which Mr. Livingston, one of the most eminent men in America, has drawn up and submitted to the legislature of that state, they having unanimously previously intrusted to him the arduous undertaking. It is a noble monument of genius, industry, and patient research, and we hope that it will lay the foundation for similar systems throughout the civilized world. It is high time that the legislature of Great Britain should take up this subject in good earnest: America has certainly taken the lead, and set the example.

We shall lay before our readers the arrangement of Mr. Livingston's work, with pertinent observations upon its different codes, for which we are indebted to the "North American Review," one of the best conducted periodicals in the United States.

The "System of Penal Law" opens with a preliminary title, briefly stating the fundamental objects for the attainment of which it is established, and the plan and divisions in which it is framed.

The original design of Mr. Livingston was to comprise the whole system in a single code, giving a separate book to each of the principal divisions; a little experience, however, showed him that, by such an arrangement, the subdivisions would not be sufficiently numerous to preserve order and distinctness in the distribution; and that, by forming separate codes, these would be secured, and an easier mode of reference obtained. This plan and division, therefore, were finally adopted.

The system comprises four distinct codes, and a book of definitions.

The first is called the "Code of Crimes and Punishments." It is divided into two books: it contains general principles, and the description of all acts or omissions that are declared to be offences, with the punishment assigned to each.

The second is called the "Code of Criminal Procedure." It is divided into three books: it contains the means provided for preventing offences that are apprehended, and repressing those that exist; it directs the mode of bringing of-

fenders to justice, and it describes the forms to be used in judicial proceedings.

The third is called the "Code of Evidence." It is divided into two books: it contains the nature and whole law of evidence in penal as well as civil cases, and it lays down the rules applicable to the several kinds of evidence.

The fourth is called the "Code of Reform and Prison Discipline." It is divided into three books: it contains a system of prison discipline, in all the stages in which imprisonment is used, either as the means of detention or punishment; the places of confinement, the treatment of prisoners therein; and the proper provisions for the voluntary and compulsory labour of discharged convicts and irreclaimable vagrants.

The concluding division of the system is a "Book of Definitions," which defines the technical words and phrases used in the several codes.

I. The "Code of Crimes and Punishments" is, of course, the most interesting portion of the work; it is that in which Mr. Livingston displays his adherence to, and interpretation of, the principles of jurisprudence previously laid down as the basis of his system; that by which the soundness and practicableness of these is to be effectually tested. It is a different, perhaps an easier task, to reason on the general principles of science, to point out incontrovertibly what justice, philanthropy, and knowledge require, than to frame laws imbued with the spirit of these, which shall also meet the exigencies of human society, and prevent or repair the injuries arising from depravity or crime. To show what is right and fit, is the delightful aim of philosophy; to reduce it and apply it to practice, is the studious labour of legislation.

The first book of this code contains general provisions, relative to the operations of the laws, to prosecutions and trials, and to the circumstances under which acts, that would otherwise be offences, may be justified or excused. These provisions embrace, in brief and simple language, what is necessary to protect the criminal from injustice, while they sustain the administration of the laws. In most instances they do not differ from those which belong to the enlightened jurisprudence of modern times; but in some, Mr. Livingston has made changes too important not to be noticed.

Offences are explicitly confined to such acts or omissions as are made the direct subject of legislative decision; and no pretence of their being within its meaning or spirit, no vague reference to the laws of nature, religion, or morality, is permitted to sanction the notice or punishment of them. The necessity of this provision has been proved by the frequent practice of American courts. Deriving their jurisprudence chiefly

from the unwritten code of England, many instances are not wanting of the introduction of constructive crimes which are utterly at variance with institutions where interference in the different departments of government is forbidden. No injurious consequences arising from an unpunished offence accidentally unprovided for, can equal those which have resulted, and must inevitably result, from judicial legislation.

Another provision, novel in its character, which is introduced by Mr. Livingston, is that which simplifies the law, and ascertains the comparative degrees of guilt where crimes are committed by several persons. To assimilate a person actually ignorant of a crime with the perpetrator, because accident or the bonds of kindred may have made him acquainted with and induced him to conceal it, seems to be equally harsh and unjust. To relieve a suppliant offender who relies on our generosity, is an act which humanity can scarcely condemn, even in a stranger. To make obedience to the law consist in sacrificing the ties of nature, in betraying those nearest and dearest to us by affection and by blood, can only be the rule of a barbarous and distant age. "Almighty power," Mr. Livingston eloquently remarks, "might counteract, for its own purposes, the feelings of humanity; but a mortal legislator should not presume to do it. In modern times such laws are too repugnant to our feelings to be frequently executed; but that they may never be enforced, they should be expunged from every code which they disgrace." To put an end, therefore, to this conflict between natural sensibility and harsh legislation, Mr. Livingston provides that no relative of the principal offender in the ascending or descending line, or in the collateral as far as the first degree, no person united to him by marriage, or owing obedience to him as a servant, shall be punished as an accessory. He thinks, however, that cases involving other ties of gratitude or friendship, cannot be so properly distinguished by law, and he leaves them for the consideration of the pardoning power.

The second book of this code is the most important in the whole system. It enumerates, classes, and defines all offences, as well as prescribes the nature and extent of punishments. The former naturally divide themselves, for the purpose of arrangement, into two great classes of public or private injuries, according to the character of the object against which they are directed. The latter are founded on the principle, that loss of personal liberty, of property, and of social and political privilege, are the best modes of suppression, prevention, and reform.

Under the head of public offences are ranked those which affect the sovereignty of the state, in its legislative, executive, or judiciary power; the public tranquillity; the revenue; the right of suffrage; the public records; the current coin; the internal and external commerce; the freedom of the press; the public health; the public pro-

perty and highways; the morals of the people; and the exercise of religion. Each of the offences falling under these heads is accurately defined, and provisions intended to meet every case have been introduced, with an industry that has left little, if any thing, unnoticed. In regard to some of them there is considerable novelty.

In offences against the legislative power, all interference by violence, threats, or corruption is forbidden under appropriate penalties, instead of being left to be repressed by the supposed inherent right to punish contempts.

In those against the judiciary, while such as are of more usual occurrence are guarded against, those which may be committed by the functionaries themselves are specially considered. Combating with firmness, but without disrespect, the strongly-urged sentiments of those who think it degrading to suppose that men entrusted with this high office can be influenced by such inducements as would bias others, Mr. Livingston has applied, in this instance, the same strict principles of positive legislation as in every other.

"I acknowledge," he remarks, "the force of the maxim, that confidence in generous minds begets a disposition to merit it; but I deny the propriety of its general application. The penalties of law are founded on the supposition that, without them, its precepts would not be fulfilled. Could we count on that generous disposition which the objection supposes, there would be no need of any sanction to our laws. The legislator need only point out his will, and express his confidence in the integrity of those to whom it was directed, and the work of legislation would be done. But the argument is not pressed so far. It is acknowledged that penalties are necessary to insure obedience in ordinary cases; but it is said that judges form an honourable exception. Restrain all the rest of the world by the fear of punishment; trust to the integrity of the judge for the performance of his duty. What! will you impose no restraint? no impeachment for corruption? no indictment for bribery? Yes, these we will allow; but he must not be restrained from accepting presents as the testimonials of friendship, which are no more than common courtesies of life. Now, if you can think it necessary to guard against the gross corruption of direct bribery, why will you permit a practice which is the most common mode of effecting it? Not to speak of their being made the vehicle for the more glaring crimes, their unfavourable effect on the mind of man is evident to any one who has the slightest knowledge of the world. Received as tokens of kindness at first, their slight value excites no suspicion: they are multiplied; their value is increased, and the obligation goes on augmenting until it can only be discharged by a favourable decree. But the practice ought to be forbidden, if it should have no other effect than that of exciting suspicion. If the judge has been in the habit of receiving presents of

game or liquors from a suitor who gains his cause, the loser will not fail to attribute it to the flavour of the venison, or the exquisite taste of the wine. Nor is the inhibition either new, or considered as derogatory to officers of the highest trust. It is a constitutional provision, that no one holding an office of trust or profit under the United States, shall accept any presents from a foreign power. If this does not degrade the ambassador, why should a similar one degrade the judge? Besides, be consistent. You have two sets of judges; if those who determine the fact, when they are exhausted with hunger and fatigue, receive the slightest refreshment from one of the parties, you dishonour them by setting aside their verdict, as being corruptly procured, and often punish them for misconduct; and yet you think it degrading to the other class of judges to prevent them receiving gifts of much greater value."

So in regard to the punishment for contempts—a power subject to be exercised by courts in a manner and to an extent utterly at variance with the principles conceded in every other instance to be just. This indefinite offence, and this dangerous power, are reduced to that certainty and limit which are prescribed in respect to other crimes. Ample means of repression are vested in the court: they may remove every actual interruption of their proceedings; they may enforce prompt obedience to their orders; they may, if simple removal is not sufficient, restrain by imprisonment. But here their extraordinary interference stops; the interruption being at an end, the trial and punishment must follow in the regular mode. The judge is not made an accuser, nor the accuser a judge; the dignity of the court is not lessened by angry altercation; above all, the chosen ministers of the law are not specially allowed to violate its most sacred forms.

Among offences against morals, Mr. Livingston has embraced and punished insulting and indecent language to women, deliberate seduction, and the infamous agency of ministering to the vices of others; all of them basely profligate, though our codes, following in the track of the English law, have omitted or inadequately guarded against them. In the same spirit, he has denounced a proper penalty against violating the sanctuary of the tomb; a provision in accordance with the natural sentiments of men in every country and age.

Under the head of private offences, are ranked those which affect individuals, and injure them in their reputation, their persons, their political privileges, their civil rights, their professions, and their property. From among them is wisely and humanely excluded, suicide; the sad act of misfortune or despair, which most criminal codes have chosen to treat as a crime of the deepest dye. It seems, indeed, a peculiarly strange dictate of law, to pursue with penal sanctions

the inanimate body, which has ceased to feel either ignominy or pain. But it becomes still more so, when, by so doing, we inflict exclusively upon the innocent all the consequences. To prevent or to remedy, even to punish it, is beyond our power; we can only harrow the feelings, and seize on the fortunes, of those who have been made already to suffer from the sensibilities of human nature, and, with impotent revenge, strike the guiltless because the guilty has placed himself beyond our reach. The justice, therefore, as well as the propriety of omitting this, in the enumeration of crimes, seems indisputable.

In treating of offences which affect individual reputation, Mr. Livingston has examined, with extreme care, the whole subject of libel and slander. This has always proved peculiarly difficult, where free institutions exist, since the instrument usually employed in the work of detraction, is also one necessary to spread information, promote science, support political and civil liberty, and disseminate the truths of religion. To permit its unrestrained employment for these noble ends, and yet to prevent its use for the destruction of individual reputation and happiness, is a task worthy, from its importance, of the most zealous studies of a beneficent and patriotic legislator. In the code of Louisiana, the indefinite and absurd offence of libelling incorporeal beings (if we may use the phrase) is totally abolished; men are to be protected, not governments, courts, or corporations; private character is to be guarded, not public measures. These, which are for the benefit of all, must be guarded by the approving support of all; they must be strong enough, in the language of Cromwell, "to stand against paper shot," or they are not worth guarding; and while to discuss them in the widest possible range must be a trifling evil, to impose the least restraint on their examination would be one of incalculable amount. In regard to individual character, however, every man is equally protected from defamation, every man has a right to appeal to the laws; and, upon the same principle, whether he is thus injured while executing a public trust, or pursuing his private business. That principle, as admirably laid down by Mr. Livingston, is, to punish an act wilfully done, which injures the character of a fellow-citizen, without any motive of private good or public duty. This reaches the great object of the law of libel, without violating any rule of justice or general utility; it meets the cases, in which the truth of the statement may or may not be a justification; it permits the exposure of that which is proper to be made known, but not of what, without any corresponding benefit, would tend only to produce injury, ridicule, or misery.

In the important title of offences against the person, (a class of crimes which it is, perhaps, the first object of civilized society to prevent,) each

of the various kinds of injury, from a simple assault to homicide attended with every circumstance of aggravation, is defined with extreme care, and with an anxious desire properly to measure the degrees of guilt. In the sections relating to justifiable homicide, the rules are clearly laid down that authorize the execution of the orders of magistrates or courts, and the defence of person and property to the last extremity. In no branch of criminal law are such rules more needed for the information and protection of a citizen. His first duties to his country and to himself are those of aid to the public officer and resistance to private aggression. Properly to perform these, is not only legal, but praiseworthy; to do so improperly, constitutes an offence, which brings down the severest penalty of the law. The same act in one way is a duty, in another a crime. It is, therefore, a cruel defect in legislation, to leave in the slightest degree obscure, as has been too generally the case, the rules that justify homicide, either in the execution of a public law, or the defence of a private right. Excusable homicide is made to differ from this, in being involuntary, and unavoidable by common prudence or care. Culpable homicide embraces those acts which can neither be justified nor excused, and which, beginning at the lowest degree, where negligence alone, without any criminal intention, is to be attributed to the perpetrator, rises to murder in its appalling forms of assassination and parricide. Those who are satisfied with the provisions derived from the common law of England, which knows only the two classes of manslaughter and murder, will, perhaps, be startled at eight degrees of guilt, graduated according to the intention and manner of the crime. Yet, certainly, to confound together a sacrifice of life caused by negligence and by design; by extreme provocation and with the want of any; by open attack, and by secret assassination, poison, or lying in wait; by avowed hostility and by a breach of those holy relations which imply confidence, fidelity, or protection; is a defect of jurisprudence in respect as well to the designation of crimes, as to the just assignment of punishment.

The class of offences which forms the concluding chapter of this code, embraces the numerous catalogue of those affecting property. They are arranged and defined with much care, whether arising from a malicious intention to destroy, or a fraudulent design to appropriate property that does not belong to the offender.

The means by which Mr. Livingston proposes to secure obedience to the provisions he has thus made; to prevent or to punish the offences he has thus elaborately arranged and defined; are limited, as we have already observed, to the deprivation of personal liberty, property, and social and political privileges.

He discards the disgusting, cruel, and ineffi-

cient modes of punishment which, under greater or less modifications, have continued, until a very recent period, to disgrace the jurisprudence of countries pretending to the greatest refinement, and continue at present to be approved, and even applauded, in that of the largest number of the nations of the world. He proposes to abolish at once, and in every instance, all punishments that spring from a desire to gratify revenge, or to inflict on the offenders inhuman suffering. He stops not with the prohibition of the faggot or the rack, because they are universally denounced by modern justice or humanity; but he equally prohibits punishments of the same character, that are yet retained, and which a similar spirit of justice and humanity ought equally to condemn. Banishment, imprisonment in chains, exposure to public derision, mutilation, and stripes, are all still inflicted by the codes of enlightened nations, but are all a violation of the same principles, which prohibit, in penal sanctions, injustice, cruelty, and revenge. Banishment forces upon another country him who has violated the laws of his own, in defiance of the common rights of nations; it leaves the criminal at liberty to repeat his crime, where his character and habits are unknown; it holds out no means of reformation; and it offers no salutary example to deter others from the commission of a similar offence. Imprisonment in chains is at once cruel and unequal; it is always a torture to the weak, and may be so to the strong, according to the discretion and petty despotism of his jailer; it preys upon the spirit by the infliction of bodily pain; it obliges to constant and debasing indolence. Exposure to public derision is a mode of punishment, whose absolute inefficacy has been established by its increased disuse; it can produce no reform in the offender; it serves, on the contrary, to harden him in crimes; it offers no useful example to those who behold it, for it appeals only to the lowest passions, and if it creates any other sensation, it is that of sympathy. Mutilation is almost repudiated from the code of modern nations: it inflicts indelible marks of disgrace, which drive the wretched victim into the constant repetition of his crimes; it has no real motive but revenge, for its sole consequence is bodily suffering; it destroys the hope of reformation, and exhibits to society a picture that excites either its sympathy or disgust. Stripes are liable to almost every objection that can be made to public exposure and mutilation: they are founded on the propriety of inflicting pain; they are cruel and revengeful punishments; they produce public and lasting shame; they bring no repentance; convince the criminal of no error; but restore him to his associates at once exasperated and disgraced.

Mr. Livingston thus confines the punishments, prescribed in his system, to the deprivation of

personal liberty, property, and social and political privileges. Fines, disfranchisement, and imprisonment, are those only that he proposes to inflict; but these he varies and graduates according to the nature of the crime, and the circumstances that extenuate or aggravate it. Pecuniary fines; degradation from office; temporary suspension of civil rights; permanent deprivation of civil rights; simple imprisonment; imprisonment at hard labour; and solitary confinement during certain intervals of the time of imprisonment, to be determined in the sentence,—such is the scale adopted in this code. He contends that this is sufficient to produce the just ends of punishment, and has, in itself, peculiar and indisputable advantages; that it affords a prospect of reformation in the criminal, highly probable; that it restrains him effectually from the repetition of his crime; that it offers a permanent and striking example to deter others; and that it is so mild that it can enlist no prejudice against its execu-

tion and in favour of the sufferer, either among those called upon to try and condemn him, or those whose duty it may be to carry the sentence into effect. He submits, that its sufficiency is secured by the advantage it has of being divisible almost to infinity; that there is no offence, however slight, to meet which it may not be moderated; none so atrocious, that, by the accumulation of its various degrees, an adequate punishment may not be found; that it may be made, also, to suit the differences of sex, age, habits, and constitution, which in themselves cause and constitute so different an amount of actual suffering to the criminal, where the nominal penalty is the same. So far as regards imprisonment, either in its simple or more severe character, this scale of punishment looks to the penitentiary system for its complete development and perfect execution; it therefore improves in efficiency as well as humanity, with all the improvements of that admirable mode of punishment.

SITTINGS FOR MY PORTRAIT.

FIFTH SITTING.

"Indeed, my dear sir, I must proscribe that very set and thoughtful look which you have lately assumed."

"Well, but Mr. Painter, I trust you will not give me a thoughtful and vacant countenance."

"Certainly not, but I must paint what I see: so have a care that you do not make yourself appear what you are not."

"Yes, yes, I grant this is of material consequence every way; but what is to be done: am I to sit for hours in a constrained position, with a forced smile to look amiable, or a steady gaze to look profound?"

"No, no; the natural look."

"Well, how is that to be accomplished?"

"Perhaps best by cheerful or at least agreeable ideas, elicited by conversation: I wish I could thus engage your attention; for I want not a drawing of the features only, but the soul's expression. In order to this the mind must be interested, so as to avoid both the relaxation of weariness and the stimulus of undue excitement. May I request you to propose a topic which may give us at least some mental occupation?"

"Can any thing be better than to talk about your art, its origin and progress, together with the great names that have immortalised it? I confess it is not a study exactly in my way, and yet, ever since I have sat to you, I have felt myself as it were enlisted in your ranks, and inspired with an awakening curiosity respecting the powers of the pencil. And, by the bye, what strange impulses and what singular and subtle laws of association guide us! This new interest of which I have spoken reminds me of an extraordinary

development of the same kind in another way of which I was once conscious, and which may perhaps aid again in considering the diversities and ramifications, as I deem it, of the social principle. I was once travelling in a gig, and on suddenly emerging from a cross-road found myself by accident and by a sort of a jerk in the very centre of a large electioneering party, who were hurrying with pipe and drun, carriages and horses, and colours flying, a merry cavalcade, to the county town to vote for their favourite candidate. For myself, I was perfectly ignorant of the names and parties in question, and at that time cared comparatively little about politics or members of parliament; and yet in a few minutes I caught the flame, and burnt with as true a heroism and vehement anxiety as any 'chiel' among them. Nay, I believe I absolutely vociferated and clapped with the loudest, and turned as eager an eye every instant to the state of the poll. My present feeling with regard to painting is, I judge, analogous to this; and not supposing myself exclusively or preeminently sensitive, I conclude it is to be accounted for by the very nature of our mental constitution.—Now, what think you, Mr. Painter, of a long digression?"

"Oh, sir, 'tis the very thing—I have been doing wonders: pray proceed."

"Not, however, with digressions, I assure you; for in fact I wish to be instructed as well as painted. Pray what do you imagine was the origin of this splendid art of yours?"

"I presume an observation of nature."

"Probably: and do you not suppose that the first principles of the art must have been elicited by noticing the shadows of objects, which pro-

jected upon plane surfaces the very shape and figure of all living and all inanimate things. Surely the conception of the art must have been very early formed by seeing these imitations every where and in beautiful perfection. Trees, mountains, animals, were thus exhibited on the outspread canvass of Nature herself."

"You are unquestionably right; and accordingly simple outlines existed long before the expression of relief or the application of colour. It was simply drawing, and of course at first very rude and imperfect in its character. The second step was to apply colours and to attempt the fillings up; which was primarily done by merely covering the different parts of a sketch with different colours. Afterwards, from observing how the objects of nature appear in relief, what is termed the "*chiaro-scuro*" was invented; for which, indeed, even before the application of colours, the Greeks have acquired a merited celebrity. Its origin must have been, as you have remarked, very early: in fact, it claims the highest antiquity; for Plato, who lived 400 years before Christ, says that painting had been practised in Egypt for 10,000 years. Whatever we may think of his chronology we must at least trace this noble art to the remotest ages. I might remark, too, that the drawing of figures of men and animals appears to have been most rudely practised, for we find them in Egypt, still preserved in the chests of mummies; and by these we perceive that their whole art consisted in laying on colours, without that admixture and tinting which are of such essential importance. With the exception of the Chinese daubings, we have little knowledge of the history or character of ancient efforts in art till we come to the fifth century before the Christian era."

"But I remember allusions to the subject in Homer. For instance, in the *Iliad*, Helen is represented as working at a tapestry, on which she sketched the various combats of which she was the cause."

"Very true; and what is termed lineary painting was practised long before Homer's time. Polygnote of Thasos was, I believe, the first who clothed his female figures, and varied the colours of the different parts of their dress. He was also the first, as Pliny says, who could shew the teeth. Zeuxis and Parrhasius flourished about the year B.C. 400, when the art sprung from its infancy"——

"Yes, and I should think into something like manhood; for I remember reading the story of these painters, which is, I think, to this effect.

There was a contest of skill between them. Zeuxis declared himself to be vanquished; for while in a cluster of grapes which he had painted, he deceived the birds, Parrhasius, in a curtain which he executed, deceived Zeuxis. What was the progress of your art among the Romans? I should suppose, from their energy of character, it must have been early introduced and successfully cultivated: unless indeed their military projects absorbed all taste."

"This might be the case. They were long content to employ foreign artists, till Fabius became both the first painter and the first historian in his country. He, however, awakened no emulation, and not a painter of celebrity adorns the Roman annals till the times of the emperors. The worthless Nero emulated this art, and ordered a colossal picture of 120 feet to be painted, which was destroyed by lightning. This is the only painting on cloth mentioned by the ancients."

"Were not the ancients distinguished by their paintings on walls and ceilings?"

"Yes; and their paintings were either in fresco, with deeply inlaid colours and a bold outline; or on the dry stucco, in distemper or encaustic painting, about the nature of which there has been some dispute. But Pliny says the most eminent of the ancient productions of art were the moveable pictures, on wood, canvass, or marble. Four paintings of the latter class have been found among the antiquities of Herculaneum. The art of painting, which had sunk into decay, was revived in Europe about the commencement of the fourteenth century. The first attempts were made in Italy, and were devoted to the representation of our Saviour's passion on the walls of chapels and churches. A great number of figures were often crowded into their subjects, often to the extreme detriment of the general effect. Dominique Ghirlandais, a Florentine, was the first who grouped his figures, and distinguished by exact gradations the spaces which his figures occupied. Leonardo da Vinci was the inventor of numerous details in this art:—but I shall fatigue you with my details."

"Oh, by no means; quite the reverse. I am prodigiously interested in a subject somewhat new to me; but I was about to inquire respecting what has been often termed the '*schools of painting*.'"

"I am glad you have named this, because, instead of merely referring to a few individuals whom I was about to mention, it will be best to introduce them in their proper connexions."

BRITAIN.

CHAPTER II.

18. THE old British religion was Druidism, a system which was here carried to perfection.

The objects of worship were a supreme Being, called *Hassus* and *Tertates*; *Teranis*; the sun

and moon under various names, as Bel, Belinus, Belatucardus, &c., to which their cromlechs, and circular masses of large stones and round towers were dedicated; Saturn, Jupiter, and Mercury, whom their mythology derived from the same source as the Greeks and Romans; Andraste, Orwana, and Minerva, and hundreds besides. According to Gildas, they had more deities than the Egyptians, for they deified the stream, mountain, lake, valley, and almost every object in nature.

Their religious principles were twofold: First, such as the initiated alone acquired in the most secret manner, and which they were bound, by the most dreadful oaths, to keep from the rest of mankind; these, except the immortality of the soul, which was encumbered with metempsychosis, or the passage of the soul into other bodies, were not allowed to be written, nor divulged to women, nor exposed in any other way. Second, such as were suited to the depraved and ignorant multitude, calculated to flatter their leading passions, and to enrich and aggrandize the priests. These—the acquisition of which required twenty years—were taught by the priests or Druids; conveyed in fables, songs, and marvellous traditions; and, usually uttered from an eminence, produced, as might be expected, a great effect upon the people.

Their rites, according to Diodorus, consisted in singing hymns made by the priests, and accompanied by music, in praise of the sun. Their prayers were offered through the priest or Druid, whose hand was upon the sacrifice, which was commonly an ox, sheep, calf, goat, or some other valuable animal, of which they always selected the best. But often this sacrifice was either from the unfortunate or the innocent of mankind. The human victim was generally offered amidst crowds, before or after a war, in a public sickness, or when some great man was ill. And the mode of sacrifice was to prepare a huge wicker-work colossus, fill it with the victims, surround it with faggots and hay, and reduce it to ashes. Their other sacrifices were mostly divided into thirds; of which the sacred fire took one, the priest a second, and the sacrificer and his friends the remainder. They had no statues of their gods; their temples were all circular; and, before worship, they thrice went round the altar. They were also greatly addicted to divination; some of their methods in which may be learned from the description below.* They worshipped

the moon, or the evil god, at midnight, deprecating its wrath; but the sun at noon. They divided their time into weeks, but do not seem to have observed a Sabbath; yet they held a lunar religious feast, which began, says Pliny, on the sixth of every new moon. The annual cutting of the mistletoe, generally about the tenth of March, their new year's day, was another feast. On the first of May was a feast to the sun, when they lighted fires on all their high places. Midsummer's day was also a sacred feast. November the first was a feast of thanksgiving for the summer and the harvest.

Their places of worship were roofless, and stood on hills, or in the heart of the thickest groves, surrounded, according to Lucan, with a moat. The priests, when engaged in religious acts, were always garlanded with oak leaves. The druidic priests were much hated by the Romans; and were cruelly destroyed, in the isle of Anglesea, by Suetonius. A few who escaped to Ireland and the Scottish isles soon disappeared; but the effects of their doctrines and practices were traceable among the people till the time of the Norman invasion.

The priests, a division of whom was called Druids,—from the Greek name of the oak, their sacred tree,—had supreme power in religious affairs, and, indirectly, in secular proceedings also; dwelt apart from the people; nor could any act of religion be performed without them. They were all exempted from taxes, and from state services. The Archdruid was chosen by the vote of the other Druid-priests; the election sometimes ending in a war. His residence was in the isle of Anglesea, as vestiges still extant are thought to prove; and the whole druidical hierarchy—composed of two orders, the Druids above named, and the Faids, whose office it was to indite hymns and superintend the music—were subject to his authority. According to Diodorus, Strabo, and Caesar, the priesthood pretended to foretell things to come, and to receive messages from the gods. Like the monks of modern times, some of the British priests were formed into fraternities, and invested with special privileges, while others retired to the hermitage or cell. Most of them lived in a state of celibacy; attended, however, with female slaves or devotees. Their property consisted of a portion of the offerings made to the gods; the spoils of war; the gifts of the people, large in proportion to their gratitude or their fears; or land, which, in some instances, amounted to whole islands, as the isles of Harris, Man, Anglesea, Wight, &c. The Druids practised medicine, taught the little knowledge which the people then possessed, administered the laws, which were uttered in a kind of verse, and initiated nearly all the rich into their orders, from which great emoluments, and greater power, necessarily accrued. These were still further increased by the fact, that, on the

last day of October, every person was obliged to extinguish his fire, and could rekindle it only from the Druid's altar, after the payment of the national tax; to secure which the custom was doubtless introduced. The number of the Druids was probably not less than thirty thousand; in fact, the Druids were the scholars, poets, divines, and judges of their age; which, added to their wealth, accounted for their power. They taught something of astronomy, mechanics, a metaphysical mythology, geography, and a marvellously potent botany.

To these Druids might be added, according to Tacitus and Suetonius, the three sects of Druidesses; the first of which were devoted to perpetual virginity, lived together in societies, pretended to the gift of prophecy, to supernatural power over the sea, diseases, the animal and vegetable world, and even over themselves; on which accounts they were greatly admired by the people. Another sect married, and waited on the celibate Druids; and a third performed the meanest offices of the temples.

The Britons, especially those inhabiting the north, were, according to Strabo, who saw many of them prisoners at Rome, six inches higher than even the Germans, who, till then, had been reputed the tallest of men. They had blue eyes and yellow hair, which they dyed with still brighter colours, wore it long, and washed it often; they were very muscular, and swift of foot. Like all barbarians, they were indolent, counting it dignified to abstain from labour; they were all shaven, except on the upper lip; were very egotistic and vain; long lived, many of them exceeding a hundred and twenty years; loud voiced, inquisitive, vindictive, and hospitable, as a sign of which, the chiefs never shut the doors of their huts. The natives shared, in common with the savages of other lands, in the arts of climbing, swimming, wrestling, and in the power of passing unhurt through forests and bogs, where, by decoying their Roman enemies, they often beat them; and from their accomplishments in these important respects—still cultivated by thousands of their more civilized successors—they often derived their names. Till the third century, they went nearly naked, except, indeed, on special occasions, when the women were known from the men by wearing fuller clothing, which, though made of skins, was by no means wanting in gaiety. What they wore in the day covered them at night. They also used mocassins, or a garment which at once answered for breeches, stockings, and shoes, and which they called "*bracce*;" and kings were often known from the rest by having on their heads plumes of feathers.

The Britons were also fond of relating their

feats of strength, of cunning, and deceit, which one tribe regarded as quite lawful to practise on another. But they had an utter aversion to every kind of slavery. Some writers think they indulged in games of chance, but this is very doubtful.

At the invasion, the food of the inhabitants was roots, baked acorns, wild fowl, and cattle, wild or tame. Pliny relates that the Britons used a kind of butter, and ate twice a day; but that, for reasons unknown, they never used the hen, the hare, the goose, nor certain kinds of fish. They also used to preserve their flesh by a species of black salt, made from wood ashes and sea water. The ordinary drinks were water and milk, often mixed with the blood of enemies; honey diluted, and called "*mead*;"* and an intoxicating liquor, something like beer, which the natives would often drink in immoderate quantities for many days together.

At meal-times the old British sat in a circle on the ground, each having a little stool, on which his food was placed, which he ate with his fingers, while his children or slaves stood behind to serve. Their dishes were osier or wooden baskets; and their drinking vessels were horns or shells, whence they sometimes called their drink "the strength of the shell." They had frequent feasts, always attended with dancing, music, and songs, and often followed by war on some other tribe, or a hunt, in which the women and dogs joined; while some authors maintain that the aristocratic game of hawking must be traced to the practices of our savage ancestors.

Marriages were also celebrated by feasting; when, if the bridegroom was rich, he gave presents to his wife, if poor, he received them from their mutual friends. At the birth of the children, the women are said to have needed little and often no help; while the new-born child was plunged in a river or lake. The sons were trained to arms from a certain age, before which the father thought himself disgraced if found in their company; and they are said to have been often fed with the point of the sword, to make them remember that on its use depended their food. Names were not given till after the children had performed some remarkable action, the nature of which should discriminate them and become their name.

The old British were distinguished from nearly all other barbarians by the great attention which they paid to their women, who were often treated as oracles, and allowed to exercise a considerable power. Chastity does not appear to have been one of their virtues, though there are reasons to believe that they punished adultery.

* The mead-maker was the eleventh person in dignity in the old Brito-Cambrian court.

ANECDOTE OF BONAPARTE.

THE following adventure occurred in the brilliant days of Napoleon's empire.

It is well known that he was fond of going about Paris, early in the morning, accompanied only by the Duke de Frioul, and he was always greatly pleased when he escaped being recognised. About six o'clock one morning, in the month of March or April, he left the Elysée early, in company of Duroc. They bent their course towards the Boulevards, and on arriving there, the emperor observed, that they had got out very early, as all the shops were yet closed.

"I must not play the Haroun-al-Raschid so early," said he; "besides, I believe it was always at night that he wandered forth with his faithful Giaffar."

When they arrived at the Passage du Panorame, some of the shops were already opened. One of them particularly attracted the emperor's attention. It was the celebrated *magazin* of Florence alabaster, which was kept then, as it is now, by M. L——, and his sister, natives of Switzerland.

There was at that moment nobody in the shop but a servant girl who was sweeping it, and whose movements were much constrained by the fear of breaking any of the brittle but invaluable articles around her. The emperor was amused at the cautious way in which she performed her task, and after he had stood looking at her for some time he said, "*Ah, ça!* who keeps this shop? Is there neither master nor mistress here?"

"Do you want to buy any thing?" said the girl, suspending her labour. Then leaning on her broom, she rested her chin on her two hands, and stared the emperor full in the face, apparently half inclined to laugh at his eccentric appearance. Certainly it would be difficult to imagine a more comical figure than Napoleon presented in his Haroun-al-Raschid costume, as he used to call it.

He wore the famous grey frock coat;* but it was not the coat itself, it was the make of it, which rendered it so singular. The emperor would never allow his clothes to be in the least degree tight; and consequently his tailors made his coats as if they had measured them upon a sentry-box. When he married Maria Louisa, the King of Naples prevailed on him to have his clothes made by his tailor. The emperor wore them most courageously for a short time; but he could endure the torture no longer, and he begged for mercy. He submitted the question to the decision of the empress, who as long as she could ride on horseback, and take four or five meals a day, was always good-humoured and willing to agree to any thing. She therefore granted Napoleon full power to dress according to his

own fancy; saying that she liked the Emperor as well one way as another. Perhaps she would have spoken more correctly had she said she did not like him any better one way than another.

With the loose frock coat above described, the emperor wore a round hat, slouched over his forehead, to prevent his being recognised. His unfashionable appearance, joined to his abrupt and uncereemonious manner, led the servant girl to conclude, at the first glance, that he wished only to purchase some trifle, worth about ten or fifteen francs, and that it was certainly not worth while to call her young and pretty mistress for so paltry a customer. But the emperor thought differently, and after looking about him for a few minutes, he asked in an authoritative tone, whether there was any one whom he could speak to.

Mademoiselle L——, who had just risen, at that moment came down stairs. On seeing her, the emperor was struck by her beauty and her elegant appearance; and in truth she might well have vied with the finest woman of the imperial court.

"*Parbleu, Madame,*" said the emperor, touching the brim of his hat, (for he could not venture to take it off lest he should be known,) "it would appear that you are not very early folks here. A good shopkeeper should look after her business better."

"That would be very true, sir," replied Mademoiselle L——, "if business were going on well. But as it is, it matters very little whether we are in our shops or not."

"Is then trade so very bad?" said Napoleon, examining various things on the counter.

"Ruined sir, totally ruined. I know not what will become of us."

"Indeed! I had no idea that France was in so pitiable a condition. I am a foreigner. I wish to make a few purchases, and, at the same time, I should like to learn from so agreeable a person as yourself, some particulars respecting the state of business in Paris. What sort of vases do you call these?"

"These are the Medicis form," replied Mademoiselle L——.

"They are very beautiful. What is the price of them?"

Mademoiselle L—— opened at once her ears and her eyes. The vases were marked at three thousand francs. She told Napoleon the price of them; but he merely nodded his head; and then said: "Pray what is the reason that trade is so bad?"

"Oh, sir, as long as that *little man* our Emperor is so madly intent on war, how can we hope to enjoy either prosperity or happiness?"

As she spoke these words, Mademoiselle L—— threw herself into a chair, and the emperor stood looking at her with the admiration and respect-

* Latterly he frequently wore a blue one.

ful interest which her beauty was calculated to excite.

"Is your husband with the army?" inquired the Emperor.

"I am not married, sir; I live here with my brother, whom I assist in carrying on the business. We are not French, we are Swiss."

"Ah! ah!" said the emperor; and he uttered these exclamations with as much indifference as if he had been yawning. "Well, I will purchase these two Medicis vases. I will send for them at eleven o'clock. Take care to have them ready."

With these words, which were delivered in a truly imperial tone of authority, he touched the brim of his hat, and darted out of the shop, beckoning the Duke de Frioul to follow him.

"That girl is very interesting," said he to Duroc, as they left the Passage du Panorame. "When she told me she was a Swiss, I fancied I beheld before me one of the wives of the heroes of the Renty.* Do you think she knew me?"

"I am confident she did not, Sir. No; her manner was too calm and too self-possessed. She had no suspicion of whose presence she was in."

The emperor remained silent and thoughtful for a few moments; then as if suddenly recovering from his abstractedness, he looked around him with an air of calm dignity. Duroc, who described the whole of this scene to me, said he was certain that some unworthy thought had for a moment crossed the emperor's mind, but that he had immediately banished it.

At eleven o'clock, two porters, accompanied by a footman in imperial livery, arrived at the shop of Mademoiselle L—. The footman was

the bearer of a little billet, requesting the lady would herself accompany the vases and receive payment for them.

"And where am I to go?" said Mademoiselle L—, trembling; for on seeing the imperial livery, she began to regret the freedom with which she had spoken to her customer in the morning.

"To the Elysée Napoleon," said the footman. The vases were carefully packed and delivered to the porters, and Mademoiselle L—, accompanied by her brother, followed them, trembling like an aspen-leaf; yet she was far from suspecting the whole truth.

On arriving at the Elysée Napoleon, they were immediately ushered into the Emperor's cabinet. He took three bills for a thousand francs from his desk; and presenting them to Mademoiselle L—, said with a smile:—"Another time, Mademoiselle, do not be so ready to murmur at the stagnation of trade." Then wishing her good morning, he retired into his interior apartment.

The brother and sister were both sensibly alive to this generosity. Mademoiselle L— used to relate the adventure with the most charming simplicity and feeling. It had taught her a lesson; and since that morning, she readily admitted that the depression of trade may exist without any fault being chargeable to the head of a government.

The little man, too, had grown wonderfully great in her estimation, not because he had purchased from her a pair of vases worth three thousand francs, but because he had forgotten a remark which many others in his exalted station would have regarded as an unpardonable offence.—*Memoirs of the Duchess D'Abrantes.*

THE BOY'S LAST REQUEST.

BY MRS. SIGOURNEY.

Half-raised upon his dying couch, his head
Dropped o'er his mother's bosom—like a bud
Which, broken from its parent stalk, adheres
By some attenuate fibre. His thin hand
From 'neath the downy pillow drew a book,
And slowly pressed it to his bloodless lip.
"Mother, dear mother, see your birthday gift,
Fresh and unsoiled. Yet have I kept your word,
And ere I slept each night, and every morn,
Did read its pages with my humble prayer,
Until this sickness came."

He paused—for breath
Came scantily, and with a toilsome strife.

"Brother or sister have I none, or else
I'd lay this Bible on their heart, and say,
Come read it on my grave, among the flowers;
So you who gave, must take it back again,
And love it for my sake." "My son!—my son!"
Whispered the mourner, in that tender tone
Which woman in her sternest agony
Commands, to soothe the pangs of those she loves—
"The soul!—the soul!—to whose charge yield you
that?"

"To God who gave it." So that trusting soul
With a slight shudder, and a lingering smile,
Left the pale clay for its Creator's arms.

REVIEW.

WORKS OF MR. LEIGH HUNT.

His Poetical Works. Shelley's "Masque of Anarchy," published by the same; and Preface by him, as Editor.

It is not often that we feel ourselves called upon to review authors, except through the medium of their works; but occasions sometimes arise when, if we

* The field in which William Tell, Valther, Furst, and Standfaccoor took the oath.

would secure to an individual his just consideration as a writer, we must enter somewhat at large into his personal history as a man. The appearance of Mr. Leigh Hunt's poetical works under the circumstances hinted at in the preface, renders this deviation from our usual course, in the present instance, a plain and indispensable duty.* An author whose talents are acknowledged to be of a very high order, who has enriched our poetry, adorned our general literature, and contributed as largely as any writer of the age to its political illumination, has been permitted, after many years of indefatigable industry, and with an unblemished character for moral worth, to sink into neglect—neglect which has, at last, involved him in all the irritating perplexities of pecuniary embarrassment. Without criminating Mr. Hunt, or justifying the public, we think the present a fair opportunity for placing their respective treatment of each other in the full view of both; to show the former that his present situation may be traced as a natural consequence to causes which exist in himself and the tenour of his literary life; and to convince the latter that they have been unconsciously influenced, by the spirit of a powerful and unprincipled party, to alienate their patronage from a meritorious individual, who, with all his faults, has every claim upon their generous indulgence and support.

Mr. Hunt began his career under circumstances peculiarly auspicious. His first publication, even at the early age of sixteen, exhibited mental powers and moral tendencies which afforded ample promise of a matured character of excellence. Hymns and prayers occupy a considerable portion of its pages; and in the effusion entitled "Christ's Hospital," he expressly recognises the worship of that faith which was taught to the youth who there learned to bow with him before the throne of heaven; and he devoutly hallows "the name of the all-powerful God,"—the honoured Deity of its holy cloisters. In the "Palace of Pleasure," the victim of despondency is thus addressed:—

"Come, then, O come to this composing breast!
Come, on the Cross repose the weary head;
Come, for this bosom soothes the tired to rest,
And this hard cross yet makes an easy bed.
This hand can join again life's parted thread;
This eye can animate the pallid cheek
With one warm look, though health has long been fled;
This arm can raise to strength the drooping weak;
This arm the gush of woe, the rack of torture break.
My name's Religion. He who reigns above
Calls me his own."

The largest list of subscribers we almost ever remember to have seen, is prefixed to this volume; dignitaries in church and state, and men of all the learned professions, figure in its columns. Thus patronised, we might have augured for the literary aspirant a happy and successful course; but how suddenly

"A change came o'er the spirit of his dream!"

It was impossible for a youth of his temperament to behold unmoved the grand spectacle which the theatre

* A collection of his poetical works into one elegant volume was suggested to Mr. Hunt by his friends, for the purpose of relieving him from embarrassments which persecution and misfortune, after years of struggling, had at last brought upon him. This work, at its first appearance, was put into the hands of the author of the present article by the editor of a leading periodical, with a request that he would write a critical notice of its contents, with a special view to the furtherance of the benevolent object it was chiefly designed to accomplish. With this request he complied; but the article appeared so mutilated, and so changed in sentiment as well as spirit, that it scarcely retained a particle of its identity. It is published here in its original form, because the writer values the opinions and views which it maintains, and because he wishes to revive public attention to a volume which has every claim to its admiration. He is happy to learn that Mr. Hunt's genius and perseverance have at length enabled him to triumph over the depressing circumstances which, for a season, threatened to overwhelm him.

of the world was then unfolding to his view. The old despotisms of Europe, to his ardent imagination, appeared tottering to their base; his bosom responded to the chant of liberty. He saw nations rising in their might, breaking their chains, and proclaiming the reign of freedom. In his native country, the conflict of opinions was fierce and deadly. The government, by its subsidies, its armies, and its fleets, had been aiding a more sanguinary warfare, to suppress every where the rising spirit of the people against their rulers. In his eyes, this was an offence never to be expiated; and he commenced his political career by joining the standard of the oppressed. With moderate reformers he felt but little sympathy: the radicals of that day were revolutionists; they hated every thing established in church and state. Mr. Hunt, perceiving that the system was full of corruption, and that the men in power were civil tyrants and religious hypocrites, too hastily concluded that the Augean stable must not only be cleansed, but demolished, in order that a new and better structure might be erected on its ruins. This was the tendency, though not the avowed object, of his political lucubrations. We have this distinct impression on our minds from recollections of the leading articles in the "Examiner," which we read in succession as they came out, for several years. Monarchical institutions, if not assailed, were not defended; and not only was the Church attacked, but sophisms were invented, and more than insinuations thrown out against Christianity itself; in fact, the editor went the whole length of the most violent of his party. He had not, indeed, the ferocity of Cobbett, nor the coarse ribaldry of Paine, but the subtle spirit of both pervaded his writings: where the one was brutal, he was sarcastic; where the other cut religion with a vulgar joke, he tainted its purity with a malignant innuendo. The "Examiner" was not so great a favourite with the populace as some other periodicals which pandered to their taste; Mr. Hunt was too fond of literature and the fine arts to sink to their level; nor was his journal much in vogue with the best educated. Those of the higher classes that liked its principles were not pleased with its intolerable affectations and puerile conceits: it was too refined for the vulgar, and too vulgar for the refined; yet it maintained a very important station, and exerted a considerable influence on the public mind. Its ultra principles, and its severe animadversions on men and measures, rendered it long an object of hatred to the government. The attorney-general scrutinised its columns with an eagle eye, and only waited for an opportunity to pounce upon its editor, and visit all his sins by an exemplary punishment of one. Perhaps the bitterest sarcasm against royalty ever uttered was that which described George the Fourth as "every inch a king." Mr. Hunt, in evil hour, offered some flippant and not very gentlemanly remarks upon the person of the royal voluptuary. In their truth, however, consisted their point; they wounded to the quick, for they grievously offended the vanity of the monarch. The luckless editor was now within the circle of *ex officio* authority, and he was haled to judgment and to prison. The length of his incarceration, viewed in connexion with the losses he sustained in consequence of it, to say the least, was harsh, and savoured more of revenge than of justice. The public, and many distinguished individuals, regarded it in the light of persecution; and the sufferer was often cheered by their personal sympathy, and assisted by their pecuniary liberality. The libeller was forgotten in the victim; and many who censured the offence became the patrons of the offender, when they saw the arm of vindictive power raised against him.

His "Feast of the Poets," and the "Descent of Liberty," a mask, were published in the years 1814

and 1815, and are dated from Surrey gaol. They show, at least, that imprisonment had not damped the ardour of his mind, and that he could write poetry of sufficient beauty and power to entitle him to a niche among his contemporaries. Neither of these productions were likely to conciliate his enemies; the first, indeed, was directly calculated to increase their number, and that, too, among the *irritable genus* who know how to avenge real or imaginary injuries on a sensitive spirit like their own, much more effectually than attorney-generals, with bolts, and bars, and dungeons at their command. The next year the public were surprised and delighted by the appearance of the "Story of Rimini." This beautiful poem procured him golden opinions from all whose judgment and feeling are of any value; while, as might have been expected, it brought down upon him the uncandid animadversions of the Tory critics, who were glad to abuse his poetry, because they hated his politics. But more of this anon.

Mr. Hunt's next movement was a step which, had it been a trap laid to enthrall him by the most subtle and malicious of his foes, could not have produced to him and his fame a train of more disastrous consequences.

The removal from his country, the breaking up of all his connexions, the fatal copartnership in the "Liberal,"—a periodical which provoked some, disgusted many, and disappointed all,—which associated him with a debauchee in morals, and an atheist in religion, and who, though men of the brightest genius, could spare him none of their glory, but who covered him with all their disgrace,—are circumstances in his life which he must incessantly deplore, and to which his friends can never advert but with the keenest anguish; and it would be well if this were the worst. He might have retrieved much of the mischief which the termination of this unhappy affair had entailed upon him, could he have borne the wrongs under which he smarted with the mild and manly dignity of a philosopher. This, unfortunately, was beyond his moral capacity. Why would he, wretched limner that he was, give the world such a portrait of himself as appears in almost every page of the pretending quarto entitled "Lord Byron and his Contemporaries?" Where was his self-respect? where his love of genius and of justice? and where that reverence for the tomb which refuses to desecrate it till the cold remains are resolved into their parent dust? If Byron had been alive, it would have been another affair; but even then a wise man would have hesitated to tell the world that he had been treated as a menial, and trampled in the dirt; unless, indeed, he felt that he could derive honour from the degradation. This was the last fatal blow to Mr. Leigh Hunt's popularity as a writer; and it is aggravated by the reflection that it was inflicted by his own hand.

Nor could he return to his political undertaking, in the character of an editor, with the same advantages as formerly. Sunk, as he was, in his own estimation and that of the public, he had other and more formidable difficulties to encounter. This species of publication had undergone a change; a new race of journals had sprung up; Sunday papers had multiplied with astonishing rapidity; radicals had become more radical; and those who formerly regarded the "Examiner" as an oracle, now worshipped at other shrines; they sought for doctrines still more levelling, for democracy less disguised, for infidelity more unequivocally impious; while the reflecting portion of those who had, through life, supported liberal opinions, had become apprehensive that a too ardent zeal for ultraism might endanger the constitution, and a too unqualified hostility to superstition involve the ruin of true religion. Yet, with all these various causes operating against

him, we are of opinion that Mr. Hunt's present distresses call loudly for the sympathy of the public; and that his failure and his misfortunes are full as much to be attributed to an external force which would have reduced him to the extremity under which he suffers, even if he had done far less to bring it upon himself.

It must on all hands be acknowledged that he is a man of genius, that he has greatly accelerated the march of social improvement, that he has opened to us many sources of intellectual pleasure, and that, in the vigour of his faculties, he ought not to become the victim of heartless oppression. His enemies have done their worst. His danger is, at this moment, greater from indifference than hostility. Neglect is often more fatally injurious than active persecution. Of this he has had his full share; and it is now high time to medicate his wounds, and to put him into a situation which may render the evening of his days tranquil and useful.

Let it be remembered, that for nearly thirty years he bravely and nobly stemmed the tide of corruption that threatened to involve our liberties in its maddening course; that when he bared his arm against the furious elements, there were few, comparatively, to cheer him on; that when he fought our battles, it was a mortal conflict—that there was peril in every stroke, and that he lost his freedom where he might have sacrificed his life; that if his simply literary productions have not all the vigour and polish which would rank them with the first performances of the age, they were written and prepared for the press under every disadvantage—while he was pressed by the cares of business, or worn down by the lassitude of intellectual drudgery; that the stormy regions of politics are most unfavourable to the growth of poetry; and that what he has composed of this nature has been run down far below its average merit by a host of critics, who, with their well-directed artillery, have avenged on the poet the delinquencies of the man. No individual has had less of fair play than the author of the "Story of Rimini." The cutters and the slashers have mangled him with relentless cruelty; ridicule has had its laugh at his expense, and cold malignity has emitted all its venom. A new canon of criticism has been invented, for the purpose of excluding him from the rank of poets, and epithets have been coined to render him contemptible. The gentle Keats was rancorously hunted to death, out of sheer enmity to him; and Byron and Shelley almost demonised, because they fearlessly avowed their admiration of his talents. What a triumph had the Ebony school, when, with a ferocity unequalled in modern times, they found him vulnerable, and without his armour, exposing himself, as we sorrowfully confess, to their bitter and unmanly taunts! And shall we suffer the victim to die under their tortures? We believe that every heart not "charred and blackened with the flames of its own bad passions," spontaneously answers—"No."

Let it not hence, however, be inferred that we are insensible to the blemishes which disfigure the poetical works of Mr. Leigh Hunt. We know our duty as critics, and fearlessly perform it; but we will not stifle in our bosoms the kindly feelings of humanity: we will temper judgment with mercy.

Mr. Hunt has very correct notions of what poetry ought to be, and is himself a critic of no mean standing. He has an eye for poetic beauty, and an ear attuned to its harmony. What, for instance, can be more just than his description of poetry in the preface to the present volume? We only wish he had always realized his own conception:—

"Poetry, in its highest sense, belongs exclusively to such men as Shakspere, Spenser, and others, who possessed the deepest insight into the spirit and sympathies of all things; but

poetry, in the most comprehensive application of the term, I take to be the flower of any kind of experience, rooted in truth and issuing forth in beauty. All that the critic has a right to demand of it, according to its degree, is, that it should spring out of a real impulse, be consistent in its parts, and shaped into some characteristic harmony of verse."

We are afraid that a very large portion of the contents of this volume cannot be tried by this standard. The "Story of Rimini" comes nearest to the perfection which it requires. It is a tale of impulse and power from the beginning to the end, discovering at the same time a delightful play of fancy. It perpetually reminds us of the old Italian poetry, the plain and simple pathos of Dante and Boccaccio, and now and then its revelations open to us a depth and delicacy of feeling, which prove how nobly the author is endowed with all the higher qualifications of his art. We scarcely dare commence the pleasurable task of quotation, for in gratifying ourselves we should greatly trespass the bounds allotted to this department of our work. Where we do not extract, however, we may refer; and the very first page comes upon us with all the fresh and fragrant loveliness of a clear spring morning. The description of Evening is scarcely inferior; and throughout the poem Nature appears as in her prime, playing at will her virgin fancies. The poet must have felt all the beauty he so exquisitely describes; but the human interest of the poem is its mightiest charm. We need not inform our readers that the tale develops the gradual progress and final accomplishment of a criminal passion, under circumstances which exhibit the principal actors and sufferers in the tragedy rather as the victims of others' vices than of their own depravity. We know not how it was possible for Francesca, even had she been pure as Eve in innocence, not to have been captivated by the youthful Paulo, whom she was first taught to regard as her intended husband, and whom she no sooner saw than loved, especially when the character of the real husband is viewed in contrast with that of his brother. We are far, however, from palliating the guilt by which her unsuspecting nature was ensnared,—which was so signally punished by the natural course of events, and which, we think, affords a most impressive moral to the story—a moral the more true to nature, and the more worthy of her, because it is not inculcated by the poet, and, as he says, was not even thought of by him. It is in his presentment of "Two Brothers," that Mr. Hunt puts forth his best powers of description and discrimination. As the interest of the tale increases, we are brought to sympathise with the heart-breaking anguish of the once innocent and happy daughter of Ravenna's lord. If there be any who doubt whether poetical justice has been inflicted upon the culprit, let them read and ponder well the following exquisite passage; it is not, indeed, in the Don Giovanni style of retribution; but the heart that it does not touch must be cold as marble.

"But she, the gentler frame,—the shaken flower,
Plucked up to wither in a foreign bower,—
The struggling, virtue-loving, fallen she,
The wife that was, the mother that might be,—
What could she do, unable thus to keep
Her strength alive, but sit and think and weep?
For ever stooping o'er her broidery frame,
Half blind, and longing till the night-time came;
When, worn and wearied out with the day's sorrow,
She might be still and senseless till the morrow;
And oh, the morrow, how it used to rise!
How would she open her despairing eyes,
And from the sense of the long-lingering day,
Rushing upon her, almost turn away,
Loathing the light, and groan to sleep again!
Then sighing, once for all, to meet the pain,
She would get up in haste, and try to pass
The time in patience, wretched as it was;
Till patience' self, in her distempered sight,
Would seem a charm to which she had no right;
And trembling at the lip, and pale with fears,
She shook her head, and burst into fresh tears.

Old comforts now were not at her command;
The falcon reached in vain from off his stand;
The flowers were not refreshed; the very light,
The sunshine, seemed as if it shone at night.
The least noise smote her like a sudden wound,
And did she hear but the remotest sound
Of song or instrument about the place,
She hid with both her hands her streaming face.
But worse to her than all (and oh! thought she,
That ever, ever such a worse could be!)
The sight of infant was, or child at play.
Then would she turn, and move her lips, and pray
That Heaven would take her, if it pleased, away."

Her death must close the extract:—

"Her favourite lady, then, with the old nurse
Returned, and, fearing she must now be worse,
Gently withdrew the curtains, and looked in:—
O! who that feels one godlike spark within,
Shall say that earthly suffering cancels not frail sin
There lay she, praying, upwardly intent,
Like a fair statue on a monument,
With her two trembling hands together prest,
Palm against palm, and pointing from her breast.
She ceased, and turning slowly towards the wall,
They saw her tremble sharply, feet and all,—
Then suddenly be still. Near and more near
They bent with pale inquiry and close ear:—
Her eyes were shut—no motion—not a breath—
The gentle sufferer was at peace in death."

We cannot say that we are quite converts to Mr. Hunt's doctrine of double rhymes, triplets, and Alexandrines. We still think that they are unsuited to the stately grandeur and measured harmony of heroic verse, and that their frequent recurrence altogether changes its character. Whether the change may not be better adapted to some subjects than a rigid adherence to the original couplet, is another question; but then it should assume its appropriate name, and not be confounded with that from which it differs in some essential particulars: what that name may be we are not prepared to state. Mr. Hunt, however, is quite right in observing, that "There is a consistency in manner as well as matter. The foliage of every species of tree does not suit every other, nor would be very safely displaced for any."

As Mr. Hunt announces the present as an edition of his poems which he has so carefully corrected that there are only two words retained to which he conceives there can be the slightest pretence for objection, we are surprised to observe so many proofs of bad taste, and so much evident carelessness in the construction of many of the lines. We have no wish to be fastidious; but we think that a rhyme which occurs perhaps a dozen times, and which has an air of affectation *about* it, might have been easily replaced by another and a better. In the first page we have—

"And there's a crystal clearness *all about*,
The leaves are sharp, the distant hills look *out*."

Again, in page 5—

"For in this manner is the square set *out*,
The sides, path deep, are crowded round *about*."

Page 16—

"Up with a burst of thunder goes the *shout*,
And rolls the trembling walls and peopled roofs *about*."

In thirteen lines further we read—

"Then for another and a deafening *shout*,
And scarfs are waved, and flowers come fluttering *out*."

Again, in the next Canto—

"And with a bag of money issuing *out*,
Scattered the ready harvest round *about*."

In page 52—

"And franklier then than ever midst the *shout*,
And dancing trumpets ride uncovered round *about*."

Again, page 58—

"A land of trees, which, reaching round *about*,
In shady blessing stretched their old arms *out*."

In the next page—

"From under which, sent through a marble *spout*,
Betwixt the dark, wet green, a rill gushed *out*."

And a little before—

"And all *about* the birds kept leafy house,
And sung and warbled in and *out* the boughs,
And all *about* a lonely sky of blue."

In the 89th page the same thing occurs—

"Made signs and she guessed what grief he came *about*,
And so his arm squeezed gently, and went *out*."

"Looks of *courting*." Courting is a word too familiar, we had almost said vulgar, for the connexion in which it is introduced.

How coarse is the following line—

"She had *stout notions* on the marrying score."

"He was to be caught," page 50, is liable to the same censure.

What a halting line is the following:—

"Stern, constant watch, though all things else *go sleep*."

These are mere notes in the sun, which we should not have deemed it worth our while to notice, did we not wish that this "thing of beauty should be a joy for ever," and that every blemish that art can remove may be polished away.

THE GENTLE ARMOUR.—Our readers will scarcely credit us when we assure them that this "gentle armour" is neither more nor less than a lady's under garment that shall be nameless; and that the description of it in the poem, as first worn by the knight, and then by the bride, in open church, is altogether the most offensive to good taste that can well be imagined. An author must indeed have been driven to his "shifts" for a subject before he could venture on such a theme, and in such a strain as the following,—which, by the way, is written, not in burlesque, but in sober seriousness:—

"Arms and a vest I sing, which, meant in blame,
His glorious hauberk to a knight became;
And in the field such dire belabouring bore
As gentle *linen* never stood before."

This hauberk the hero receives in a packet, from the hand of a page whom he had sent on a tender message to his mistress, and who, as he delivers it—

"Speaks the while, 'My lady saw me not,
But sends this answer to the note *she got*.'
With trembling hands the string is cut, they lift
A lid of pasteboard, and behold—a shift!"

And it is of this strange thing Mr. Hunt thus writes in the preface:—"My great object in writing the poem was to vent my delight at the gallantry of a lover who could fight three armed people at once, with no other covering than a sentiment in the shape of a piece of linen."

"Hero and Leander" has its full share of the writer's characteristic faults and beauties. It reminds us, we are sorry to add, very much to the disadvantage

of the present performance, of the richly imaginative, and, we had almost said, perfect poem by Mr. Hood on the same subject. "The Feast of the Poets" is mutilated—sadly mutilated. We cannot reconcile ourselves to this old friend with so new, or rather so changed, a face. Fortunately, however, we possess the original edition, and it is worth preserving. Of the other poems in the collection we have not space to say anything. As the editor of Percy Bysshe Shelley's posthumous poem—the "Masque of Anarchy"—we are happy to express our obligations to Mr. Hunt, both for the poem and the preface; the one is worthy of the genius which produced it; the other is eminently creditable to the heart of friendship, which has paid a warm and just tribute to the memory of one who, eccentric in every thing else, was steady in his attachments.

Of Mr. Shelley's recorded negation of a Deity, the proofs are too strong to admit of doubt or palliation. We are glad, however, to find, from the testimony of one who knew him so intimately, that atheism was rather an insane vagary of his mind, than a principle operating upon his heart. Mr. Hunt says of him,—
"If ever there was a man upon earth of a more spiritual nature than ordinary, partaking of the errors and perturbations of his species, but seeing and working through them with a seraphical purpose of good, such an one was Percy Bysshe Shelley."

We have thus put upon record what we really believe to be a fair and just estimate of Mr. Leigh Hunt, as far as his character and works are known to the public; and we close our observations with an extract which will abundantly show how highly he was appreciated by those who were most in his confidence. Mr. Shelley, in dedicating to him the "Cenci," a tragedy of five acts, and one of the most elaborated of his works, thus addresses him:—

"I inscribe with your name, from a distant country, and after an absence where months have seemed years, this, the latest of my literary efforts. Had I known a person more highly endowed than yourself with all that it becomes a man to possess, I had solicited for this work the ornament of his name. One more gentle, honourable, innocent, and brave; one of more exalted toleration for all who do and think evil, and yet himself more free from evil; one who knows better how to receive, and how to confer a benefit, though he must ever confer far more than he can receive; one of simpler, and, in the highest sense of the word, of purer life and manners.—I never knew, and I had already been fortunate in friendships when your name was added to the list."

These mutual encomiums have, at least, the merit of being sincere and disinterested. They also prove that virtues of the rarest order, either real or imaginary, were the basis of the attachment which produced them; and we cheerfully award to the survivor the full benefit of the precious legacy thus bequeathed him by his departed friend.

LONDON.

PLAGUE.—During the dreadful plague of 1665, forty thousand servants were dismissed in London; no one would receive them into their houses, and the villagers near London drove them away with pitchforks and firearms. During this dreadful calamity there were instances of mothers carrying their own children to the public graves; and of people delirious, or in despair for the loss of their friends, who threw themselves into them alive! A pit forty feet long, sixteen wide, and about twenty deep, was dug in the Charterhouse; and in two weeks it received 1,114 bodies.

MORALS.—Divide the 1,500,000 inhabitants of London. What is their state? 12,000 children are always training in crime, graduating in vice, to reinforce and perpetuate the great system of iniquity;

3,000 persons are receivers of stolen property, speculators and dealers in human depravity; 4,000 are annually committed for criminal offences; 10,000 are addicted to gambling; above 20,000 to beggary; 30,000 are living by theft and fraud. That this dreadful energy of evil may not flag from exhaustion, it is plied and fed by £3,000,000 worth of spirituous liquors annually. 23,000 are annually found drunk in the streets; above 150,000 are habitual gin-drinkers; about the same number of both sexes have abandoned themselves to systematic debauchery and profligacy.—*Rev. J. Harris.*

CHARITIES.—Within the London bills of mortality there are 502 places of public worship; 4,050 seminaries of education, including 237 parish charity schools; eight societies for the express purpose of promoting

the learned, the useful, and polite arts; 122 asylums and almshouses for the helpless and indigent, including the Philanthropic Society; 30 hospitals and dispensaries for sick and lame, and for delivering poor pregnant women; 704 friendly or benefit societies, and institutions for charitable and humane purposes; which several institutions are supported at the almost incredible sum of £750,000 per annum.

TRAVELLING.—In 1742 the Oxford stage-coach left London at seven o'clock in the morning, and reached Uxbridge at mid-day. It arrived at High Wycombe at five in the evening, where it rested for the night; and proceeded, at the same rate, for the seat of learning on the morrow. Here, then, were ten hours consumed each day in travelling twenty-seven miles; and nearly two days in performing what is now done with the greatest ease under six hours. To go from London to York—200 miles—used to take six days; it now occupies twenty hours. From London to Exeter, eighty years ago, the proprietors of coaches promised "a safe and expeditious journey in a fortnight;" private carriages now accomplish the journey—175 miles—in twenty hours; and the mail (the Devonport) in seventeen, passing through Wincanton, a new route, within the last month. The Manchester "Telegraph," from the Bull and Mouth, performs her journey, with the greatest regularity, in eighteen hours.

"THE FORTY FOOTSTEPS."—Many years ago, when all was flourishing around in its most rural verdure and peopled pleasantness, there existed one tract

in a lovely green of meadows, which usually appeared deserted; or, when visited, the human beings discerned there were few in number, or most frequently only some solitary persons in musing mood, moving slowly through its long grass. To this spot, so generally deserted, tradition had given the name of the "Field of Forty Footsteps."

As that field, like many others, has become lost under the daily extension of London, and, with it, every trace of the awful marks from which it takes its name, it may not be uninteresting to our readers, perhaps, to relate a word or two of the tale they told, and give some description of the locality of the spot in which these footsteps laid. The footsteps were in the middle of the field, and forty in number, and not a blade of grass would grow upon them. They are said to have been imprinted by the approach and struggle of two combatants who had fought and perished there, in the dead lock of mutual hatred. In regard to its particular situation, this field was between the back of Gower-street and some other meadows more to the eastward, and that skirted the lane called the Duke of Bedford's road, at that time running northward from the top of Southampton-row, Bloomsbury. The first stone of the London University was laid at the north-western extremity of this field; and now this mysterious memorial is gone for ever; every blade of grass is effaced from the surface of the field, and the scathed marks lay buried under the feet of youths seeking honours from learning and wisdom.

GEMS.

THE COUNTRY AS IT WAS.—There is a sort of pleasing melancholy in comparing the habits of former times with those of the present day. The contrast is not much, I must confess, in favour of the latter. The poorer class were formerly in the habit of looking up to the old halls of our ancestors as places where their wants would be relieved, their misfortunes attended to, and their injuries redressed. There was then a tie existing between rich and poor, which poverty and distress only made the closer. If sickness visited a family, ready relief was to be obtained from the venerable mansion near the village. If a cottager, from misfortune, got behindhand with his rent, his kind landlord was always considerate, and in cases of death he was the first to console the widow and the orphan. If he came to the village church with his family, with some degree of state, having his footmen behind the carriage with their formal liveries and their bags and nosegays, an example of devotion and decorum was set, which could not fail to produce an influence on the neighbouring peasantry. Little or nothing of this is now to be seen. The old halls of our English gentry are fast falling to decay, or are occupied by farmers; and those whose ancestors were formerly venerated for their virtues and hospitality, are either living in crowded cities or imbibing foreign manners, drawing their resources from lands which they never visit, and from tenants whom they have never seen.—*Jesse's Angler's Rambles.*

PARTY SPIRIT.—Those who have the plague of party spirit are not only in a dangerous case themselves, but they carry about a mortal infection, which they frequently communicate to others.—*Mr. Fletcher.*

PHRENOLOGY.—In regard to the principles of phrenology, though I at one time believed them to be true, I have since seen reason to abandon them. In proportion as they took root in my mind, I found them to exercise a benumbing influence on my faculties; and so far as my observation of others went, the practical tendency of the study was any thing but be-

neficial. In regard to the young, especially, its tendency was to inflate the mind, rather than to instruct it. I have seen young people, who could not have had patience to read the works of Locke, or Boyle, or Brown, after skimming the pages of Combe, assume airs, at which better disciplined minds would have felt ashamed.—*Aldis's Lectures on Atheism.*

REFLECTION.—There is one sure way of giving freshness and importance to the most common-place maxims,—that of reflecting on them in direct reference to our own state and conduct, to our own past and future being. No object, of whatever value, but becomes foreign to us as soon as it is altogether unconnected with our intellectual, moral, and spiritual life. To be ours, it must be referred to the mind either as motive, or consequence, or symptom. He who teaches men the principles and precepts of spiritual wisdom, before their minds are called off from foreign objects, and turned inward upon themselves, might as well write his instructions, as the sibyl wrote her prophecies, on the loose leaves of trees, and commit them to the mercy of the inconstant winds. In order to learn, we must attend; in order to profit by what we learn, we must think, that is, reflect. He only thinks who reflects.—*Coleridge.*

DEW.—A single dewdrop, however small, furnishes in turn gems of all imaginable colours. In one light it is a sapphire; shifting the eye a little, it becomes an emerald; next a topaz; then a ruby; and lastly, when viewed so as to reflect the light without refracting it, it has all the splendour of a diamond. But to obtain this beautiful display of natural colours, it is necessary to take advantage of the morning, when the beams of the newly-risen sun are nearly level with the surface of the earth; and this is the time when the morning birds are in their finest song, and when the air and the earth are in their greatest freshness, and when all nature mingles in one common morning song of gratitude.—*Mudie's Spring.*

TRUTH.—The first creature of God, in the works of

the days, was the light of the sense; the last was the light of reason; and his Sabbath work, ever since, is the illumination of his Spirit. First, he breathed light upon the face of the matter, or chaos; then he breathed light into the face of man; and still he breatheth and inspireth light into the face of his chosen. The poet that beautified the sect, that was otherwise inferior to the rest, saith yet excellently well, "It is a pleasure to stand upon the shore, and to see ships tossed upon the sea; a pleasure to stand in the window of a castle, and to see a battle, and the adventures thereof below; but no pleasure is comparable to the standing upon the vantage-ground of truth, (a hill not to be commanded, and where the air is always clear and serene,) and to see the errors, and wanderings, and mists, and tempests, in the vale below:" so always that this prospect be with pity, and not with swelling or pride. Certainly, it is heaven upon earth to have a man's mind move in charity, rest in Providence, and turn upon the poles of truth.—*Bacon*.

CONTENTMENT.—It is the general misfortune not to

be content with what we have; not to see or cultivate the sources of comfort which, in our personal circumstances, may be realised: and not to value what we are enjoying, because we have it, and by the daily use of it become indifferent to it, till we learn its importance by its departing from us. If every one would but study to extract pleasure from their means of pleasure, however humble, and to be as happy as it is in their power to make themselves in their situation, without looking at other means of gratification which are not within their reach, all would experience a comfortable manhood, and learn, from their own experience, that every one may be in this agreeable condition. The Apostle presents to us the true and golden rule on this subject: "For I have learned in whatsoever state I am, therewith to be content." On this principle, we shall find that we may all sing with sincerity the sensible old song—

"My mind to me a kingdom is,
Such perfect joy therein I find."

—*Turner*.

LIFE AND MANNERS.

CLAUDE DE L'ESPINE.—In noble and generous minds a breach of friendship induces no breach of confidence. L'Espine and an old friend, from whom he had the misfortune to be estranged for a time, were competitors for the same place. He thus addressed him on the occasion: "Sir, you are soliciting a certain great situation, as well as myself. I am well informed that yesterday, in an audience that you had with his majesty, you endeavoured to render me suspected by him. Should I put into his hands the inclosed letters and papers of yours, you would be most completely out of his favour, and I should get rid of a base and insidious enemy. I return them all to you. When you wrote me these letters, and when you sent me these papers, we were friends; I ought not, then, to make an improper use of that confidence with which your friendship for me at that time inspired you."

AN INTREPID SAILOR.—One glorious instance of intrepidity was given, I am happy to say, by an Englishman. The French have not published it, but they speak of it with due and high admiration. The captain of a British merchantman, whose name I am sorry I omitted to learn, though he was pointed out to me, had confidence enough in his own seamanship to weather the whole storm, and when a boat was sent out to bring him ashore, he calmly said, "that it was his duty to save the ship and cargo if he could, and that he would do his duty." His vessel, a puny-looking thing of some fifty tons, had a crew of five men, four of whom he sent ashore, and retained only one sailor, besides his own son, a boy only ten years old. "Why retain the poor child?" you will say. I tell you he was no poor child, but a noble boy; and he persisted in refusing to leave his father.—*Campbell's Letters from the South*.

LORD EXMOUTH.—At Portsmouth, some years ago, this gallant officer was sitting alone at dinner, when his servant announced to him that an Indianman had struck upon the beach, and was in imminent danger of going to pieces. Sir Edward hastened to the shore, and found the intelligence correct, and the surf running so high that no boat dared venture to board the vessel. Sir Edward, addressing himself to the crowd on the beach, asked if any of them had heart enough to swim off with him to the ship. A young man stepped forward to answer the challenge; and two lines having been procured, Sir Edward and the stranger each took one, gained the vessel, and after safely landing all on board, were the last to return on shore. On stepping

upon land the gallant admiral, addressing his comrade in danger, exclaimed, "Give me your hand. Who are you? You must sail with me in future." The young man replied that he was the mate of a collier, and that he should hesitate to quit a situation so comfortable for the chance of doubtful promotion. Sir Edward overcame his scruples, and this singular introduction added to the heroes of the British navy an officer almost unrivalled in heroic exploits—no less a character than Captain Jeremiah Coghlan.

THE OXONIANS.—In St. John's College, Oxford, there is a very curious portrait of Charles the First, drawn with a pen, in such a manner that the lines are formed by verses from the Psalms, and so contrived as to contain every psalm. When Charles the Second was once at Oxford he was greatly struck with this portrait, begged it of the college and provincial, promising, in return, to grant them whatever request they should make. This they consented to, gave his majesty the picture, with the request—that he would return it.

PARENTS OF THOMAS A BECKET.—The story of Thomas à Becket's mother is a very singular one. His father, Gilbert Becket, who was afterwards a flourishing citizen, was, in his youth, a soldier in the crusades; and being taken prisoner, became slave to an emir, or Saracen prince. By degrees he obtained the confidence of his master, and was admitted to his company, where he met a personage who became more attached to him. This was the emir's daughter. Whether by her means or not does not appear, but after some time he contrived to escape. The lady, with her loving heart, followed him. She knew (they say) but two words of his language—London and Gilbert; and by repeating the former she obtained a passage in a vessel, arrived in England, and found her way to the metropolis. She then resorted to her other talisman, and went from street to street pronouncing "Gilbert." A crowd collected about her wherever she went, asking, of course, a thousand questions, and to all she had but one answer—"Gilbert, Gilbert." She found her faith in it sufficient. Chance, or her determined perseverance, brought her at last to the street in which he who had won her heart in slavery, was now living in prosperous condition. The crowd drew the family to the window. Gilbert Becket recognised her, and took to his arms his far-come princess, and they were soon after married.

EASTERN ABOMINATIONS.—No. II.

THUGGEE.

ONE of the worst evils of false religions, and, we may add, of false views of the true religion, is, that they are not only compatible with the systematic perpetration of the most atrocious crimes, but that such perpetration—in a manner and to an extent which make one's blood run cold at the very thought—may be done at the command and for the gratification of the loathsome idols. There have been few systems of idolatry among rude nations, in which human sacrifices have not formed part of the ceremonial by which the benighted worshippers vainly hoped to expiate their sins. But, in general, these unholy rites have been performed with such horror of "pomp and circumstance," that they have not been general, or, at all events, universal incentives to the shedding of blood by the people, in domestic life; nor did they in Mexico, or in any other place where more terrible,—if greater terror could be found on earth than was displayed in the worship of the war-god of these people,—tend to systematic murder.

Still the abomination, in such cases, is open, and its horrors must have some repulsive effect on the spectators, in spite of the enchantment of the most debasing superstition. But let us suppose that murder is carried on as a trade, and not as a trade merely, but as the performance of a religious duty, by thousands of men, not only trained to it from their infancy, but following it by hereditary descent, through many generations, ramified over the whole extent of a country containing two hundred millions of inhabitants, and remaining not only unput down, but, in their general system, unknown by a succession of governments, for a number of generations, the first of which is beyond the record even of tradition; imagine this, and imagine, farther, that the wholesale murders which these bands commit are not done under the influence of any of the ordinary bad passions of human nature, not from revenge, from the desire of concealing robbery, or from the maddening influence of any tradition, but in the most perfect calmness and coolness of blood, as a trade regularly studied, and a duty the neglect of which would bring upon them the displeasure and vengeance of the divinity which they adore; and when you have imagined these, and magnified them as far as the utmost extent of your wonder can reach, you will have some faint idea of the monstrous depravity which can be perpetrated, not only without violating the statutes of a false religion, but which may be grafted upon it as part and parcel of its ordinances.

Yet again, imagine a party of travellers,—a prince and his retinue, a company of merchants, or any other travellers whatsoever,—imagine them to be joined on the road by other travellers of

the most sober deportment, and the most agreeable manners, who shall act with all the courtesy of brothers, and be foremost in supporting the weary, and in beguiling the tediousness of the road; imagine the strangers to proceed for hundreds of miles, and to become more kind and agreeable every day, till, on arriving at some lonely place, they should recommend a halt of the whole party for refreshment; while one or two of the strangers were amusing each of the travellers, a third one should come behind and strangle each his man, the others assisting, and all so thoroughly bred in the art of murdering, that strong and weak, armed and unarmed, are all alike—for none but the murderers themselves know the mode of proceeding, and so none can guard against them. Imagine this catastrophe to take place in less time than is required for reading the notice of it; that none is left to tell the tale, not so much as a dog to find the grave of its late master, and that not the slightest suspicion is excited,—and you will have some notion of the murderous practice of the Thugs of India, to which, as a regular and systematic trade, the name "Thuggee" is given.

It appears that Thuggee has been a regular trade, descending from father to son, as most trades do in India, and that there have been organized bands of Thugs, in communication with each other, established over the whole country, from the southern cape to the northern mountains, from time immemorial; and yet that the great body of the Indian population, as well as the various governments under which India has successively been, have known very little about them, and that none of the latter have taken any steps whatever for putting them down, until the year 1831, when Lord William Bentinck organised a plan for the clearing of the country of perhaps the most atrocious pest with which a country was ever infested.

Some idea of the great ignorance in which the British government in India was in respecting them, may be gathered from the fact that, in the second edition of Hamilton's "Indian Gazetteer," published in 1828, the following is all that is said of them:—"Thugs—a notorious class of public robbers in the upper provinces of Hindostan." Instead of this, the Thugs are not "public" in any sense of the word, but more secret in their operations than any other men whatsoever, for they never act but when they are sure of their victims, and when their scouts prevent the possibility of their being surprised; and they leave none to tell the tale, and no vestige of the murder. They are not "robbers," that is, though they do take the property of those whom they murder, they commit the murder whether the parties murdered have any property with them

x

or not. They are not confined to the "upper provinces," for they are fully as numerous of higher or purer caste,—as themselves say,—and, in all probability, of longer standing in the Decan than in the north of India.

This ignorance of the numbers, the organisation, and the proceedings of the Thugs, appears to us perfectly astonishing; and yet it was only from themselves that any knowledge could be obtained; and it appears that none but the English government, after peace enabled that government to turn its attention to the welfare of the people of India, had energy and power enough to sift the matter to the bottom, and organise a system for the abolition of Thuggee. The measures which were taken by the government were most vigorous, and, from 1881 to October 1885, one thousand five hundred and sixty-two were accused of Thuggee, of whom three hundred and eighty-two were hanged, and nine hundred and eighty-six banished or imprisoned for life.

The first complete account of the Thugs was published at Calcutta in 1886, and the first general announcement of it to the British public was given in the "Edinburgh Review," for January 1887, from the article in which we have taken the greater part of our information, though the "Review" does not touch upon some points, which we consider as being of very deep and general interest.

If the Thugs were merely robbers, living by plunder, and murdering to conceal their doings from the law, we might find corresponding bands in other ill-regulated countries—in Spain, in Cisalpine Italy, and other places. But all these live as outcasts from society, and are obliged at all times to conceal themselves in the fastnesses of the rocks, or the forests; whereas the Thugs inhabit villages, and lead regular, and, according to the religion of their country, exemplary lives; and, excepting that murder which they follow as a trade and a religious performance jointly, they not only abstain from crimes, but hold the commission of them in abhorrence. A Thug is a systematic murderer, and yet he never by any chance commits what we call murder, that is, he never commits the crime for the gratification of revenge, or of any other of what we call the lawless passions.

It is this which constitutes the grand enormity of the system, and which pleads more strongly in favour of the Christian religion than the tongues of a thousand of the most earnest and eloquent preachers. Under its heavenly influence, a man cannot be a murderer without being at the same time an outcast from society. But a Hindû can; and so can a Mohamedan; though the religion of Mohamed is not an *idolatry*, but a *theism*, and a theism evidently taken at second-hand from the Bible. In Northern India, very many of the Thugs are Mohamedans, not in practice only, and as though they were

men outcast and estranged from all that is decent in society, but as men of orderly conduct in general matters, who would shrink from the perpetration of any ordinary crime, and look upon murder, committed in any other way than the practice of Thuggee, with horror and detestation. And they so far depart from the declaration of "there is one God" of the Koran, that they actually believe in the rival goddess, at whose command, and for the propitiation of whom, Thuggee is perpetrated. Thus, while Mohamedism is not an idolatry in any sense of the term, and while it is really a moral system, and its worshippers are conspicuous for their morality, it can be made to fall in with the very worst parts of the very worst system of idolatry, and yet the man in whose case it does this, can remain as good a Mohamedan as ever. Christianity cannot be so linked with iniquity, even in the most corrupt of its forms; and herein is one of the very strongest proofs of its Divine origin. An apostate from the faith of the Gospel may be a murderer, or the perpetrator of any crime of passion; but such a renegade never could be a Thug. Even if he has known the precepts of the Gospel, as merely human knowledge, without any of that more high and holy feeling which sanctifies the spirit, there is a barb of "the arrow of the Almighty within him,"—a fire which will not quench, that tortures him in the perpetration of the most concealed and profitable crime. How it may be in the case of a sort of moral Thuggee, in which the characters of men are murdered, professedly for the advancement even of this pure and holy religion, we pretend not to say; but we must admit that this is the besetting sin of not a few of the pretendedly zealous in the cause of Christianity, and we must follow the advice of the *profane* poet, at whose name they would writhe, and

"Leave them to Heaven, and to the thorns that lodge
In their own breasts, to prick and sting them."

According to this, the religious, and on many accounts the most important, view of the matter, we may, in the first place, mention the pretended Divine sanction which there is for this systematic murder. Now, any of our readers who are at all acquainted with Hindû mythology, must be aware that, among the countless muster of false, and not only false but ridiculous and abominable divinities, there is one which stands high in abomination over the rest, revolting and abominable as the majority are. We pass over the "Lingam," and others which are only revoltingly gross, without any thing or much of cruelty in them; and we also pass over Siva, or Mahadeo, the male destroyer, to the female, with the many names—Kalee Durga, Devec, (or Davey,) Bhuvanee, and various other titles—who is the fabled consort of Siva, and, as such, the goddess of destruction. Many of the rites in the worship

of this goddess are of the most revolting character; and her history, into the details of which we are not in the meantime called upon to enter, is a long and intricate one. At present we have, however, to consider her only as the divine patroness of the Thugs; and viewing her as such, the following is a brief outline of the fable:—

In an early age of the world—it must be understood that Production and Time are strangely blended together with Destruction, in the character of Deveen, and that the moral of the fable, absurd as the literal version seems, is one upon which wisdom might meditate, not unprofitably, for a month;—in a very early age of the world, Runkert Beej Danu, a gigantic demon, to whose middle the depths of the ocean scarcely reached, stalked all over the world, destroying the human race as soon as they were born or even created. This was robbing Siva and Deveen of “their lawful prey;” and so the goddess cut down the demon. But every drop of his blood instantly produced another demon; and though they were also cut down by the goddess, every drop of the blood of each of them still produced another. Thus the number of demons went on in a geometrical progression, the ratio of which was the number of drops of blood in a giant, whose waist the depths of the ocean hardly reached. This was an increase with which no flesh-and-blood (for all the gods

of the Hindûs are flesh and blood, except the mystic *Oon*) goddess could contend. Deveen, however, tugged at it till she was fairly worn out. When she could do no more by her own personal exertions, she brushed the perspiration off one of her arms, and formed two men of it. To each of these she gave a handkerchief, and commanded them to put all the demons to death therewith, taking care that one drop of blood should not be shed. The men obeyed, and the demons were speedily strangled, without any reproduction.

This great work being accomplished, to the satisfaction of the goddess, and the safety of mankind, the two men offered to return the handkerchiefs to Deveen; but she desired them to keep the handkerchiefs, as the instruments of a trade by which their posterity were to earn their inheritance, and to strangle men with those handkerchiefs, as they had strangled the demons, and live by the plunder they acquired; and, having been the means of enabling the world to get provided with men by the destruction of the demons, their posterity would be entitled to take a few for their own use.

Such is the foundation of Thuggee in the mythology; but there are some reflections arising out of it, as well as some other matters in the history of the Thugs, that will require a future notice.

TALES OF THE INN KITCHEN.—No. III.

WHEN the narrator had finished the story of the becalmed ship, it was evident that each was absorbed in the deep interest which had been excited. No one seemed willing to intrude himself on the company. At length, the fire having been replenished, unanimous wishes were expressed that a gentleman who had yet said little should unfold his tale. With some diffidence he proceeded with the following account of

THE DESERTER.

His mother was a widow. Sad and lonely is the state of the woman who has wept in the bitterness of her soul over the grave of the husband of her youth; who has gazed around her in her home, once so happy and cheerful when he was there, and, while every object that meets her gaze reminds her of the departed, feels that with the world she must struggle alone. Such was the situation of the mother of George Hayward when he had obtained his ninth year, and his sister Ellen her seventh. Early and late was that poor woman employed, in order to obtain a livelihood for herself and children; and, regardless of the expenditure of her own strength, seemed only desirous to live for their happiness.

Such instances are not rarely to be met with; and were the cottages of those in the humbler walks of life to be visited, the premature old age of many, worn out by incessant toil and continued care, would testify the self-devotion with which they had laboured for their offspring.

When George Hayward had arrived at the age of nineteen, his fine manly figure, his desperate boldness, and great strength, distinguished him from his companions; and no small emulation was manifested by the belles of the village green to share in his smiles and regards. His mother gazed on him with maternal pride, and nourished the hope that his presence would cheer her spirit as she descended to the grave, and that he, for whom she had toiled even beyond her strength, would minister to her wants when she herself was no longer able. Alas! how soon do our pleasant dreams vanish! How often is the cup of happiness, which seemed almost to touch our lips, dashed rudely to the ground! In an evil hour, at a distant town, whither he had gone to a fair which was annually held there, he enlisted; and there being at that time a demand for strong and able young men, and the sum required to purchase his discharge being greater than could be

met, he was obliged, after a short and agonising interview with his mother and sister, to accompany the recruiting party to the head-quarters of the regiment.

The grief of the widow was uncontrollable; the shock had been so unexpected, and the departure of her son so sudden, that it appeared like a dream. Alas! for the sorrowing mother, it was too true! George, in the novelty of the scenes through which he passed, and in the attention he was constrained to give to his duties, had not the opportunity afforded him for nursing that pining regret which the separation from his family, under circumstances so unexpected and painful, had awakened. But when that excitement, which the inflated language of the sergeant who enlisted him had created, and under which he had accepted the bounty money, had subsided, he began to find his situation less pleasant than he had expected, and the restraints under which he was put more irksome than he had anticipated.

Things went on thus for some months, and he found his dislike to the military life daily increasing. A refusal of leave of absence for a short period added to his discontent, and the daily expectation of embarking for Ireland, for three years' service, made him determine upon some expedient to effect his wish of visiting his native village. This he soon afterwards found means of accomplishing.

One evening the light of the setting sun was playing on the window of the widow Hayward's cottage, and she sat at the door watching her daughter as she tied up some roses that a passing shower had bent to the ground. The air was redolent of sweetness, and the soft breeze, as it played round the pale features of the mother, seemed to fan her into a momentary forgetfulness. Ellen, as she bent over her flowers to inhale their evening fragrance, started as she heard her name pronounced by a familiar voice, and turning her head in the direction whence the sound proceeded, saw a man walking up the little narrow path that led to the front of the cottage. At first the sun shone so brightly before her that she was unable to distinguish the features of the visitant, and it was not until he had come within two or three paces of her that she recognised her brother George. A joyful cry of welcome, as she ran to his arms, announced to her mother the unexpected arrival of her son. She pressed him to her heart and wept in silence. That night, as she looked on the fine manly form of her boy, seen to perfection in the regimental dress he wore, her blue eye sparkled with delight; she saw before her the living semblance of him whose death she had never ceased to mourn, and her mind reverted to the happy days of her youth, when she listened to his first professions of attachment, and to the plans he proposed for their future settlement in life.

Long did the mother and the daughter listen to the accounts which George gave of what he had seen; and the village clock had tolled the hour of midnight before the party in the cottage had retired to rest. As the widow, blest once more with the presence of her child, laid her head on her pillow, fervently did she pour forth her thanks to her God for having thus answered her daily requests.

The next morning George went not out of the house, and desired that his arrival might not be made known to his former companions and friends that day, as his journey on the previous one had been weary and long, and he felt unequal to any further excitement. Three days elapsed from the period of his return, and none but the inmates of the cottage as yet knew of his arrival. A continued indisposition was alleged as a reason for still keeping his visit a secret, and this satisfied the mother. But Ellen had noticed, on the evening he so unexpectedly appeared, that he started more than once as the wind howled through the trees, and shook the gate that led to the garden before the house; and that when footsteps were heard in the direction of the cottage he turned pale, and showed signs of evident agitation. More than once she asked him if he were ill, and received for answer, that he had not yet recovered from the effects of the exertions he had made to reach home that night; and this plausible reason, by which he endeavoured to account for the nervous feeling he had manifested, was admitted.

On the fourth morning, as he sat with his mother and Ellen at breakfast, the two former turned from the little window, and the latter seeing immediately opposite to it a bright glancing of steel, in the narrow lane before the cottage, called forth an exclamation of surprise from his sister. Her brother marked the direction in which she had looked—the cup which he held dropped from his hand, that trembled with excessive violence, and sinking on the chair, he faintly exclaimed, “Mother, I am lost.” At first she was unable to divine the meaning of his words, but supposed he had been seized by sudden illness, but, as she rose to go to him, the door suddenly opened, and three soldiers with muskets, and bayonets fixed, entered the house. The man who appeared the leader of the party, laying his hand on the shoulder of George, said, “Surrender, you are our prisoner.” His mother, trembling with surprise, and doubt, and dread, inquired, “What does all this mean?” “My good woman,” said the man, “we have come after our old comrade, who has left us after the French fashion.” The poor widow understood him not, and looked at him as unconscious of his meaning. He saw he was not understood, and immediately added “Your son is arrested as a ‘Deserter.’”

That one word entered into her soul, and for a time she lost a sense of her wretchedness and

misery in forgetfulness. Long did she lay in that state, too long for the impatience of the speaker of the party that had been sent in pursuit of George.

"You must leave her," said he; "we must be going; there is a long march before us to-day."

"Leave her thus!" said George, as he looked on his mother, pale and senseless; "Brute! though I may have been false to my king, I cannot be unnatural to her that bore me;" and again he looked, and as the sobs of his sister fell on his ear, the big tears chased each other down his cheeks. He thought not of himself—of the ignominy and shame that would be heaped upon him for his dereliction of duty—of the pain of a disgraceful punishment, or the labour and sorrows of a distant exile;—he thought not of these, but of his poor, broken-hearted, widowed mother, of his cherished and beloved sister, and of the intense and bitter anguish that would seize them when his fate was known. None would be near who could weep for him; for at most his unhappy state would awaken but a sigh in the bosom of a stranger; but they—the loved ones—would sorrow with a grief more consuming, and an agony more keen.

As his mother slowly opened her eyes, she gazed on her first-born, and with a piteous lamentation, turning to the soldiers, exclaimed, "O! do not take my poor boy from me, to lead him to those who will not think of a widowed mother's anguish—who will not spare him in their punishment. O! do not take him from me, or I shall see him no more."

"Our orders are strict," said the soldier, "we dare not disobey;" and when he looked on the woman, as she hung pale and weeping over her child, even his heart was touched, and he wiped away a tear.

Sad was the parting that then took place. The mother foreboded it would be the last; and as between his guard her son left that once happy cottage, to proceed to the town in which the regiment was located, she deemed that his long and affectionate farewell embrace was the last. A court-martial found him guilty, and, as a punishment, he was consigned to a company that was leaving England for one of the colonial stations in Africa.

This intelligence was communicated to the relatives of the unhappy man; and a faint gleam of hope was afforded, that good conduct and strict obedience might shorten the time of expatriation, and that yet again he might visit the land of his fathers, and the home of his youth. His mother bowed her head, and wept long and bitterly, but murmured not. When Ellen endeavoured to cheer her drooping spirits by reminding her of the hope which had been given them of yet once more beholding him, she shook her head incredulously, and her lips moved silently in prayer.

The next spring again brought life, and ver-

sure, and beauty to the earth. The trees, that had been stript of their foliage by the autumn winds and the winter frosts, put on afresh their green livery; and as the sunbeams glanced on the young bursting leaves, and the vernal music of the woods was heard, all was animation, and activity, and life. The wild roses were shedding their perfume, and the gay little parterre, which George had formed for his sister in their garden, was beginning to look beautiful with the rich colouring of some early flowers. But the reviving year brought not with it health and renovated strength for the bereft and widowed mother. Her increasing feebleness called forth all the attentions of Ellen, and cheerfully and affectionately were they manifested. Gradually the invalid grew worse, and drew rapidly near to her last hour.

It was on a bright evening in May, as, raised on pillows, she had been looking at the beautiful fairy clouds that hung round the sun as he sunk in the western sky. Her hand was placed on her Bible—that book which had been her companion and consolation in her first painful trial, and from which she had never failed to derive comfort and peace in her subsequent sorrows. Strengthened by the promises which a compassionate Saviour had given for the support of his servants in their earthly pilgrimage, she had been upborne under every dispensation, and had meekly bowed to the will of Him whom she knew to be "too wise to err, too good to be unkind." Her daughter—her only remaining child—had just been reading to her; and as she finished, left the book on the bed, and busied herself about some domestic concerns. When she returned to the bedside of her mother, she found her much weaker than she had expected. That weakness increased to an alarming degree, and an aged neighbour, who was then with Ellen, suggested the propriety of sending for the medical attendant, to whose care her mother had been committed. He came—but the hand of death was upon her, and at midnight her spirit passed away.

They laid her beside her husband, and a distant relative received the destitute orphan to his house, and watched over her with the affection of a parent. The unremitting attention she had bestowed upon her mother recommended her to the kindness and sympathy of her surviving friends.

Fifteen years rolled away, and Ellen had become the wife of a young man, living in the village where she had formerly resided. One afternoon, a stranger was seen, with slow and faltering step, taking his way to the village churchyard.

As he entered the little pathway that led to the church, he stopped for a moment to look around him, and the deep emotion that was visible on his countenance evinced he was not a passing traveller or an uninterested visitant. He

bent his steps towards a distant part of the hallowed ground, and stood by a grave on which two young children were playing, and laying down a bundle he had held in his hand, sat on the green mound of earth, around which some young flowers were growing, and bent his head and wept. The children, who had observed this conduct, and were alarmed at the appearance of a stranger there, ran to their mother, who, with an infant, was sitting on a rustic seat that encircled a huge elm at the corner of the churchyard, and told her a man was sitting on their grandmother's grave and weeping bitterly. The mother arose, and hastening to the spot, perceived him bending over the place where the ashes of one very dear to her were reposing; and wondering what could have awakened such an interest in the bosom of a stranger, drew near to inquire who he was. As she approached him he lifted up his head, and, uttering an exclamation of surprise, sprung forward to meet her. She looked—she could not be mistaken—though the sun had deeply shaded his brow, and he seemed tottering with weakness,—it was her brother George.

He had at length returned to his home, and

his first steps were directed to the spot where he knew his mother was buried,—near to the grave of his father—and having arrived there, he gave way to the passionate burst of grief which had attracted the observation of the children.

Led home to the house of his sister, he recounted the various events that had befallen him in a distant land; and told her that after years of toil and labour, he was at length discharged from the service through increasing debility. The air of his native land had greatly revived him, and he had found means to convey himself to his native village. He arrived there but to die. His once vigorous constitution had been broken by incessant duties under a burning sun, and a short time posterior to his return to the village of his birth, George Hayward sunk into a premature grave. The children of his sister still plant wild flowers around the spot where he sleeps, and Ellen often stands by, as they are engaged in this affecting employment, and wakes a sigh to the remembrance of former days, before her brother had taken the rash and inconsiderate step that hastened the death of his mother, and accelerated his own.

THE COSMOGONY OF MOSES.

ARTICLE VII.

THE first object which reveals itself to our astonished view, is light, the beginning of the creation of God. During the reign of obscurity, silence, and solitude, articulate sounds are heard through every region of the vast profound. Jehovah speaks, "Let there be light," and instantly the brightest image of himself starts into being, and darkness, one of the properties of the chaotic state, flies away. Thus the Creator manifested himself in the light, which was in its turn to make manifest every other creature of his power. And what did this new-born light disclose? The antecedent reign, till now invisible, of confusion and discord. And what is this wonderful primeval production of the Almighty, which, emitted through the whole extent of creation, diffuses universal and unspeakable joy. Too simple to be described, too glorious to be embellished, too mysterious to be explained, and, alas! too common to be prized. I must content myself with suggesting a few of its more obvious qualities. Its nature and essence, who is able to unfold?

The *first* and most striking quality of light is, its power of communication. As the Uncreated has communicated himself to created light, his brightest image here below, so light again communicates a secondary image wheresoever it falls. Some bodies are indeed more susceptible of the impression of light than others. Such as are pellucid, easily transmit the rays; such as are polished, easily reflect them, and from one to another, in similar direction, without end. But

even the most opaque and colourless substances are, to a certain degree, enlivened, irradiated, tinged by the rays of the sun falling upon them. The gilded palace reflects, indeed, a brighter lustre, but the dun cottage refuses not to yield its sombre, dusky acknowledgment, that the glorious orb of day has arisen upon it. The gaudy butterfly and the drowsy beetle; the blue violet, the yellow jonquil; the sapphire, the emerald; the topaz, each in his degree, receives and communicates the light. In the dark, all are of one hue; nothing is received, and consequently nothing can be given back.

Secondly. Another remarkable property of light is, the inconceivable velocity of its motion. Display but a glimmering taper from the summit of a tower, at the dark hour of midnight, and with the rapidity of thought it reaches the eye stationed on a distant mountain, though valleys, and rivers, and seas intervene. Behold, the sun arises; and in less time than is requisite to reduce his distance from the earth, in diameters of our globe, to leagues, and from leagues to miles, to write down and to recite the sum, I am already cheered with his rays, and "feel his sovereign vital lamp." What do you think is the fact here,—a fact as demonstrably certain as that two added to three amount to five? Light travels down to us from the sun, in a space of time somewhat less than eight minutes, say the half of a quarter of an hour: of this portion of time you have a distinct idea, but of the dis-

tance, and consequently the rapidity of light's progress, you can absolutely form no idea at all ; it is expressed to the eye indeed by colors, and to the ear by sounds, but thought is lost while it attempts the computation ; the distance is 71,780,000 miles.

Let me illustrate this by an example. From London to Bath is 108 miles. The speediest of our modes of conveyance requires more than 14 hours to perform that distance. The circumference of the globe is about 24,000 miles. Were it possible then to travel round the globe without the interruption of a single instant, at the rate of the speediest carriage it would require 130 days of 24 hours each, to perform a single round ; this multiplied by 3000, the distance of the sun being so many times the circumference of the globe, produces 1077 years, the time requisite to perform a distance equal to that of the sun, without a moment's interruption, and at the speediest rate of travelling. Now, light travels through that prodigious distance in little more than seven minutes ; its velocity therefore far exceeds all human comprehension : striking representation of that inconceivable, that awful rapidity, with which the Creator communicates himself to his creatures ! Even light requires time to run its race ; but before the fountain of light, distance is swallowed up and time is lost.

A third singular quality of this wonderful, this glorious creature of God, is, that notwithstanding its motion is thus inconceivably rapid, it is not only perfectly harmless, but highly grateful and salutary. The motion of every other body, when violently accelerated, carries death and destruction along with it. A globe of iron hurled from the engine by the force of gunpowder, pierces through ribs of solid oak, and shatters to atoms the flinty rock. The river, swelled by the torrent from the mountain, with resistless impetuosity sweeps before it the well-compacted bridge, the shepherd and his flock, the husbandman and his harvest, the mechanic and his forge. Let air, "thin air," be excited into more than ordinary speed, and it gradually rises from the pleasant breeze, to the brisk gale, to the stormy wind, to the roaring tempest, to the merciless hurricane ; the cedar of Lebanon is torn up by the roots, the ocean rages, and proud victorious navies are buried in the deep. But what is the rapidity of any, of all these, compared to that of light ? Yet God has tempered its rapidity so, that the most delicate of our organs, the eye, not only sustains no injury, but derives unspeakable benefit and delight, from this instantaneous transmission of its rays. But that same God can, when he will, arm it too with sudden and irresistible death. See, it bursts from yonder thundery cloud, and "the cloud-capt tower" is rent from the summit to the foundation ; it falls on hapless man, and the marrow, and the solid bone which contains

the marrow, are melted away before it. Pleasing, awful, view of the God of justice, of the God of love ! a consuming fire, a lambent flame ! Interesting and instructive view of the sovereign power which he possesses, which he exercises over every creature, to make it a well-spring of delight, or a minister of vengeance ! Glorious display of mercy overflowing, but judgment restrained ! Light, an universal, perennial, permanent source of life and joy, but only in a few rarer transient instances, the instrument of death.

Fourth. Another precious and important quality of light is, its furnishing man with an extensive and useful power of discriminating object from object ; and to this end Providence has graciously supplied him with an organ completely adapted to the exercise of this power. Let light be withdrawn, and this fair and well-ordered frame of nature reverts to chaos ; "ancient night" resumes her murky empire ; every thing is confounded : for what is beauty not seen ? what is order and harmony not understood ? And nothing can be seen without light, nothing understood or distinguished unless the medium be clear. The range of our other senses, how contracted it is ! The objects of taste and touch, in order to be discerned, must be closely applied to their respective organs ; those of smelling affect us only when brought very near ; sound grows fainter and fainter with distance, and a very few leagues remote fades and dies ; but the eye, aided by light, darts like lightning from pole to pole, measures the planets, discriminates the fixed stars, whose distance far transcends that of the sun ; it knows no boundary but the flaming boundaries of the world.

With equal facility and advantage it is enabled to contract its sphere : it descends from heaven to earth, from the distant mountain's summit to the adjacent plain ; it wanders over the enamelled mead, dwells with ever new delight on the "human face divine," traces the path of the crawling insect. The eye lends additional value to the objects of our other senses ; the fragrance of the rose is greatly enhanced by the display of its beautiful and varied tints ; the relish of what we eat and drink becomes more exquisite, or more insipid and disgusting, according as the eye is pleased, or offended ; the polish of the marble, the softness of the downy peach, are more grateful to the touch, from the concurring testimony of the other sense ; and even music, though more independent on vision than the rest, music, at all seasons delightful, gives still more delight when we behold the animated look, elegant form, the graceful air of the person who sings or plays. But the value and use of this precious organ wholly depend on the presence of light. To be in the dark is the same thing with being blind. We are reduced to the narrow, comfortless, uncertain, timid sphere of the prisoner in his dun-

geon, incapable of distinguishing friend from foe, "presented with an universal blank, and wisdom at one entrance quite shut out."

Fifth. Another property of light is its union with heat. Reflected light is not indeed possessed of this quality, or only in a very inferior degree; but light, issuing immediately from a luminous body, has a certain degree of warmth as well as of lustre; and every body, excited to a certain degree of heat, likewise emits rays of light. And what must be the mass of united light and heat, treasured up in yonder glorious orb, "of this great world the eye and soul," to admit of such an amazing and incessant expenditure in all directions, and to remain undiminished, unexhausted, by a constant efflux of almost six thousand years! Blessed arrangement of eternal Providence! The same luminary which irradiates my path, and directs me how to escape the snare, the precipice, the enemy, in unbounded profusion dispenses the vital fluid which cherishes and supports universal nature, maintains the current in the stream, multiplies and matures the golden harvest, feeds the lamp of life! Blessed union, the happiest image of Deity here below, vitality and direction in one; a quickening and an informing spirit; the principle that puts in motion, and which conducts that motion aright. Adorable, Divine skill, which has planted the habitation of man precisely at the point that terminates the extremes of hot and cold, of oppressive effulgence and glimmering obscurity; which has so completely adapted the distance, the position, the motion of our globe to the various nature, demands, and exertions of its various regions, and their various inhabitants, universally guarding against the *too little* and the *too much*! "Great and marvellous are thy works Lord God Almighty! Just and true are all thy ways, thou King of saints!"

That I may not multiply particulars to exhaust your patience, and distract your attention, I shall subjoin one more of the important properties of light, namely,

Sixth. The wonderful facility with which it may be propagated. "Behold how great a matter a little fire kindleth." A little spark elicited by the stroke of steel from the bosom of the flint, is sufficient to set on fire the course of nature. Though all material fire were exhausted, extinguished, with the assistance of one of those little bits of glass, by which weakness of sight is relieved, and a moment's sunshine, and furnished with a small portion of combustible matter, I can open to myself a new source of light, and, with it, of heat, which may be extended, and extended without limitation. Nay, the friction of one stick upon another will at length be excited into a flame, and supply materials of unbounded conflagration. Thus, heaven from above, and the surface, nay the bowels of the earth beneath, facilitate the production of this salutary, this destructive ele-

ment, which now animates, and ere long shall devour the world.

Having introduced these just, philosophical, and beautiful observations, to illustrate the properties of light, let us now avail ourselves of it, in order to trace the progress of creation, in which it was employed as a powerful agent. As we have intimated, its virgin beams first fell on chaos; and then the wondrous change began which gradually revealed beauty, magnificence, order, and fertility. We have already enumerated the works of the several days, without descanting upon any of them, with the exception of the first. That of the second principally regarded the arrangement and distribution of the great mass of matter, which constitutes the substance of the earth, into the various elements which were necessary to render it a scene of fertility and life; the determination of its form into that of a globe, distinguished by mountains and valleys, seas and rivers, continents and islands, of the diurnal motion round its own axis, and of whatever was requisite to establish its connexion with the planetary system of which it was henceforth to become a constituent part. How much of that planetary system was, during the same period, operated upon in a similar manner by the plastic energy of the Almighty, we are not informed; though it is not improbable that the sun and every planet underwent, at the same time, a transformation analogous to their peculiar characters and several relations to each other. On the third day, creation assumed its verdant livery; and the earth rolled in its orbit clothed in living green, while its oceans and rivers reflected a silvery light. Flowers and grass, trees and plants, herbs and fruits, of all kinds were produced in rich profusion.

On the fourth day, a most astonishing scene broke upon the view of those intelligent spectators, who are represented in Scripture as being present, and as watching the process of creation. The earth is now finished; the planets and the sun have arrived at their perfection. All is ready; and the spheres are waiting for the Divine command to peal their first notes, and sound the march of time. The material source of light is discovered; the sun bursts forth in his new-born splendour, and, by his glorious intervention, the orbs mysteriously linked with his destiny are revealed to each other; while, like their majestic Sovereign, he stands confessed the wonder of them all. The language in which this is conveyed by the inspired historian is simple and beautiful.

"And God said, Let there be luminaries in the expanse of the heavens, to illuminate the earth, and to distinguish the day from the night let them also be the signals of terms, times, and years; and so it was. For God having made the two great luminaries, (the greater luminary for the regulation of the day, and the smaller

luminary for the regulation of the night,)* and the stars: he displayed them in the expanse of the heavens to illuminate the earth, to regulate the day and the night, and to distinguish the light from the darkness."

It is thus, without description or parade, and in terms as brief as possible, the Almighty speaks of the most stupendous wonders of his power. The earth, one of the most insignificant planets in the system, contains in itself countless millions of creatures, any one of which, in the investigation of its nature and properties, would exhaust an angel's faculties, and at every step of his inquiry awe him into adoring admiration of its great Creator. Yet suns, stars, worlds, and systems of worlds, are thus introduced and dismissed, as if they were no more than floating atoms. There may be, and there certainly is, complacency in the Infinite mind, on a review of every display of its wisdom and omnipotence. But God cannot wonder; it is impossible for him to be conscious of any emotion of surprise; and therefore, in giving notice of the operations of his hands, he merely announces their existence. In a universe of miracles, He perceives only the results of his own volition; He pronounces the whole to be good; but he leaves it to his creatures, yes, to the loftiest and the best, humbly and reverently to exclaim, "Great and marvellous art thou in all thy works, Lord God Almighty!"

The fifth day was devoted to the formation of that infinite variety of animate creatures, that were to be the future inhabitants of the waters and the air. "Let the earth," said the prolific Source of being, "teem with living reptiles; and let flying creatures career over the earth through the wide expanse of heaven: and it was so." Oceans, rivers, and the whole atmosphere became the abode of inconceivable multitudes of beings endowed with life, more or less sensitive and active. The great sea-monsters, whether amphibious or the constant tenants of the deep; whales and crocodiles, and all the crawling, minute, or prodigious things with which the waters swarm; and every flying creature, from the majestic eagle to the insect that finds its residence and world in a single atom of light, all started into being; and when their Creator and Lord beheld them, he declared them to be good, and blessed them, saying, "Be fruitful and

multiply, and fill the waters of the seas:" and let the flying creatures, whether fowls or birds, or volatile particles instinctive with life, "multiply upon the earth."

The evening had come, and the morning had come, a fifth day, when God said, "Let the earth bring forth animals according to their kinds; cattle, wild beasts, and reptiles, according to their kinds; the wild beasts, according to their kinds; and every ground reptile, according to its kinds. This also God saw to be good." Thus are we made acquainted with the creation of the whole animal race, from the mighty behemoth to the smallest reptile that crawls upon the earth. Woods, hills, and valleys were peopled by an incredibly rapid process, with all their numerous and appropriate tribes;—an infinite diversity exhibiting the boundless resources of the Creator, and a wondrous harmony proclaiming the perfect order of his plans, and the unerring wisdom which linked together in mysterious bonds the multiform parts into one grand and comprehensive whole. The repetition is remarkable, which lays as much stress upon the formation of a worm as upon that of a world. We are told once and again, that the reptiles of the terraqueous globe were the product of the Almighty power, and the result of a previously wise determination of the Infinite mind. We cannot perceive the use of many of these, nor of those gigantic creatures which are the terror of the world; yet they are all the ministers of Providence, and the benefactors of mankind; in goodness they originated, and to the cause of universal happiness they are devoted.

The world, thus formed by the great Creator, displayed his perfections; but there was yet no rational being that inhabited it to contemplate these works, and trace in them, with adoring wonder, the wisdom, the goodness, and the power of him who made them. The sun, the moon, and the stars declared in their courses the glory of God; but they did not perceive this glory. The earth, with its productions, showed that its Maker was divine, but, unendowed with intelligence, it could not recognise the Divinity. Man, then, was formed to behold this glory, to see these traces of the Godhead, and on earth to respond to the anthems of celestial praise. In order to manifest his superior dignity at his creation, there was, as it were, a solemn consultation of the sacred Trinity; for the holy volume plainly intimates a concurrence in counsel of the three Persons for the formation, as well as redemption, of man. When other things were to be produced, God spake, and they appeared. He said, let them be, and they were: but at the creation of man, he said, "Let us make man in our image, after our likeness." His body was formed of the dust of the earth, and lay, like it, inanimate, till a nobler and immortal principle was infused in him immediately by God; "The Lord

* Moses speaks of the sun and moon here, not according to their bulk or solid contents, but according to the proportion of light they shed on the earth. The expression has been cavilled at by some who are as devoid of mental capacity as of candour. "The moon," say they, "is not a great body; on the contrary, it is the very smallest in our system." Well; and has Moses said the contrary? He has said it is a great light; had he said otherwise he had not spoken the truth. It is, in reference to the earth, next to the sun, the greatest light in the solar system; and so true is it, that the moon is a great light, that it affords more light to the earth than all the planets in the solar system, and all the innumerable stars in the vault of Heaven put together.—A. CLARKE.

breathed in his nostrils the breath of life, and he became a living soul." Being formed in the image of God, he was called "Adam," from a Hebrew word signifying "likeness."

Springing immediately from the hands of his Creator, he was doubtless endued with a perfection of body and soul of which we can form but a feeble conception. In the plenitude of his powers, he came into being. When the second Adam, the Lord from heaven, appeared to repair the ruins of the fall, he, in compassion to us, and to encourage all of every age to apply to him with confidence, became the babe of Bethlehem, and the youth that dwelt at Nazareth; but our progenitor appeared at once in his maturity, and knew nothing of feebleness, of infancy and childhood, of the dangers and inexperience of youth. "He was made a little lower than the angels." His body was probably surrounded like that of Moses, when he descended from the Mount; like that of Jesus, when he was transfigured upon Tabor. The divine image which he bore, and in which, alas! the most eminent believers in this life are but very partially renewed, consisted, as we judge from some expressions of St. Paul, in knowledge, righteousness, and true holiness. His mind, not yet darkened by sin, was free from error and prejudice, and inspired with all natural, and especially moral knowledge, necessary for his state; his soul had no vicious propensity; his will was conformed to the will of God. His heart, filled with love to God, flamed with the fervours of devotion and gratitude, by night and by day. Full dominion was given him over all the creatures; and he enjoyed an intimate communion with his Almighty Friend, and fellowship with the holy angels. It is this communion and intercourse with God which forms the felicity of heaven; must it not have given inexpressible delight to Adam upon earth? He was placed in the most beautiful part of a world, all of which was beautiful. This spot is called the garden of Eden, or of delight; its exact situation cannot, with precision, be ascertained; neither is it necessary that it should. "I do not," says good Bishop Hall, "seek where that Paradise is which we lost; I know where that Paradise is which we must study to seek, and hope to find. As man was the image of God, so was that earthly Paradise an image of heaven; both the images are lost; both the first patterns are eternal." In this favoured spot were collected all that was useful or pleasant; every variety of the animal or vegetable creation; all that could gratify the senses, the imagination, or the heart.

But there was still a void in the heart of Adam—he still needed some one of the same nature and powers with himself. Formed for social intercourse, he needed some heart that would unite with his in celebrating the Author of all good;

some being not, like the angels, elevated above him, but of the same rank with himself, with whom he might form the tenderest ties. He had looked through the inferior creation, and found no helpmeet for him, and he sighed for one with whom to share the happiness which he enjoyed. How long he remained solitary, we are not informed; long enough, however, to be taught a language by God, and to receive much instruction from him, and to survey every animal of the land and the air, and bestow upon them significant names. Feeling his wants disposed him to seek this blessing from God, and to receive it with gratitude, it was not long withheld from him. In order that his partner might be more endeared to him, God was pleased to make her not only "like him," but also "of his very substance," and then conduct her as his gift to man. Who can conceive the happiness of this blessed pair? Surrounded by every thing that they could desire, rich in the most cordial love to each other, and united in the warmest love to their God; ignorant of those vices and passions which embitter life, and of that misery which is the fruit and effect of sin; enjoying the visits of God and his angels, what more did they need? How sweet was the interchange of affection between them! how perfect the communion of thoughts, of sentiments, and good wishes! What new gratitude swelled the bosom of Adam, and with what transport, as one expresses it, "did he change the solitary, My Father and my God, into the social, Our Father and our God!" It is a state on which the imagination rests with delight; the mind, pained with the sins, the follies, and the woes which now infest the world, loves to wander back to the holy groves of Paradise, and to linger by the peaceful streams of Eden.

The institution of the Sabbath immediately followed the six days' work of creation; an institution wise and merciful, and appointed for the great purposes of devotion and happiness.

It is said, in condescension to our weak faculties, that "God rested on the seventh day from all his works which he had made;" that is, he ceased to create, he proceeded no further. Resting implies bodily fatigue and weariness; but the "Creator of the ends of the earth fainteth not, neither is weary." He ceased from the work of creation but not of providence, to teach us to rest from our work on that day. "And God blessed the seventh day and sanctified it"—set it apart as sacred, in memory of the creation of the world, as a day in which he is to be blessed and praised, and in which he communicates blessings to his pious worshippers. The first Sabbath was the first whole day of the life of our great progenitors, the first of their week. With what emotions would they gaze upon the glorious scenes around them! How would they together hymn their Creator's praise!

LIVINGSTON'S SYSTEM OF PENAL LAW IN THE STATE OF LOUISIANA.

CHAPTER II.

II. THE "Code of Criminal Procedure" naturally succeeds that designating the acts that are a violation of the law; for it points out the mode in which they are to be prevented or repressed, and in which they are to be ascertained with the precision justice requires, if they have been actually committed. It is not enough that every citizen should know what actions he ought to avoid as crimes; he should also know what means he has of preventing or punishing such as injure him, and also of defending himself when unjustly charged with the commission of such as injure others.

This code is divided into three books. The first contains the means of preventing offences, and of putting an end to such as continue; designating particularly the cases where military force may be employed in aid of the civil power, and prescribing the rules by which it is to be governed in that service. The second directs the mode of bringing an offender to punishment; and the last gives the forms that are to be used, in all judicial proceedings, to attain these ends. An introductory title states conspicuously and explicitly the objects of the code—security to the innocent, not only from the danger of an unjust conviction, but the apprehension of it; the prevention of intended offences, by pointing out when and how an individual may require the aid of a magistrate and his fellow-citizens, or use his own physical powers, to resist aggression; the destruction of all hope of escape from merited punishment by resort to technical and formal objections—a species of false clemency which can arise only from the impropriety or severity of the law in its spirit and provisions, and which violates every principle, as it destroys every benefit, it was meant to secure; economy and dispatch, objects equally desirable for the prosecution of justice on one hand, and the defence of private rights on the other, since the want of them at once increases the difficulty of conviction, and lessens the force of beneficial example where there is guilt, while it inflicts unmerited punishment on the innocent; the abolition of all vexatious proceedings; and the establishment of simplicity in forms—an end society has a right to demand, since the obligations and restraints imposed by the most perfect laws are necessarily attended with an inconvenience that ought to be reduced to the lowest degree consistent with public safety. In pointing out these distinctly, as the objects of a code of procedure, Mr. Livingston remarks, that it is done that future legislatures may weigh their importance, examine how far practice shall prove the different provisions to be in conformity with them, observe in what points deviations come to be made, and intro-

duce, if requisite, such amendments as will retain them in full effect.

The first book contains the provisions of the code for preventing offences. Among them is one, for the most part, if not altogether, novel,—bestowing honorary and pecuniary rewards on him who brings an offender to justice.

This provision, which may, at first, strike us as fanciful, if not calculated to encourage delusion, is vindicated by Mr. Livingston in the introductory report to this code, with great eloquence and much force of argument. He thinks that good policy, as well as justice, requires that some external mark should be given of that esteem which all feel for a citizen who has performed a meritorious action for the general good. That additional rewards will strengthen the motive to action, there can be no doubt; and, if they do not counteract the more refined and disinterested impulses which have the same tendency, they may be safely employed. The rewards held out for diligence, bravery, and skill in preventing an offence or punishing an offender, are addressed solely to the love of that distinction which is founded on public gratitude; such rewards may be expected to raise the citizen in his own esteem, and give him, at least, a limited celebrity, which not only augments his own happiness, but, within a certain sphere, operates as an incentive to promote that of the public.

Stronger objections may be made to pecuniary rewards for denouncing the commission of certain crimes. Strong antipathies are universally attached to the name and office of an informer, even when the laws are neither oppressive nor unjust. If these antipathies originated in times and nations where the injustice and oppressive nature of the laws forced upon the people the conviction that their execution was adverse to their happiness and interest, and those who exerted themselves in promoting it were the enemies, not the friends, of society; then it may follow that the ministers employed in upholding the execution of just and mild laws, well understood by an intelligent community, will cease to be considered as engaged in a dishonourable duty; and the acceptance of a reward, sufficient merely to indemnify for loss of time, but not so great as to offer temptations for false accusation, will cease to attach any odium to its performance. If an officer, Mr. Livingston contends, receives a salary for the performance of his permanent functions, an individual ought, with equal propriety, to receive a compensation for his occasional service. In both cases there is a sacrifice of private convenience to produce a public good; in both cases it ought to be compensated. If public prejudice is against it, it

may be replied, that the same prejudice formerly existed against the functions of the regular officer, but that it has gradually given way to the force of truth and the progress of knowledge.

In framing the provisions which authorise the interference of magistrates to prevent offences, and to search for property illegally taken, the cases of interposition, and the evidence necessary, are pointed out with great precision; a circumstance peculiarly required where something must be left to the discretion of the officer, and where opportunities may exist for much oppression, extortion, and fraud. Under the title of "Suppressing Offences against Personal Liberty," are contained regulations for granting and enforcing the writ of *habeas corpus*, so complete as to give the fullest effect of that most simple and admirable of all contrivances for securing personal liberty. Strongly impressed with the utility of this great writ, Mr. Livingston seems desirous to increase every facility for procuring it, to enlarge the sphere of its relief, to give an adequate sanction to every provision respecting it, to impress upon the people the utility of preserving, and the danger of violating it, and to perfect, in every way, so invaluable a safeguard, bequeathed to us by the wisdom and patriotism of our fathers. In prescribing the highly interesting rules for military aid to the civil authority, such are adopted as may attain the end with the least violence. The militia are to be used—a force differing in nothing from that which is daily at the call of the civil officer, except in being organised and armed. It is, of course, only to be employed when the ordinary power has completely failed. Before it is brought up, a magistrate must display a white flag, and order the rioters to disperse. Unless to repel an attack endangering life, the order to disperse must be disobeyed for half an hour before offensive arms are resorted to. When these become necessary, those only (such as the sword and bayonet) which may be directed solely against the assailants are to be adopted; and the dangerous effect of fire-arms, which may injure the innocent as well as the guilty, is left to the last extremity.

Having prescribed the means of preventing inchoate offences, and arresting the course of such as are in operation, the second book of this code contains the mode of conducting prosecutions for those already consummated. Minute and careful regulations are laid down respecting arrest, detention, and bail, so as to make them clear to the most common understanding. In the whole course of procedure, there is no circumstance productive of so many vexatious, and even fatal effects, as that of arrests. Officers of justice, often extortionate and overbearing, pass the limits of just authority; accused men sometimes submit to this injustice, at others they resist where they should yield; and no incon-

siderable proportion of violent infractions of the law constantly arises from an ignorance of rights and duties in this respect—an ignorance inevitable where there is any obscurity or want of fullness and precision in regulating so important a branch of the conduct of every citizen.

The manner and effect of an examination of the accused by a magistrate, immediately after his arrest, have always been subjects of doubt and difficulty. On the one hand, it gives to the innocent the best opportunity of prompt explanation and self-defence; it obliges the guilty to give that account of his conduct which society has a right to demand from every one apparently infringing the laws. On the other, this explanation is not made before those who try the accused, and, of course, gives him little of its benefit; it may be attended with captious and insidious questions, which disguise rather than elucidate the truth; and it may unjustly increase suspicion against the thoughtless or the timid. To secure these advantages, and to obviate these dangers, several provisions are introduced into this code. The prisoner, as soon as arrested, is to have counsel. Before his own examination he is allowed to hear and read the evidence and depositions of the witnesses against him. The interrogatories which he is then required to answer are prescribed by law, and point only to such simple circumstances as can be detailed with great simplicity of language. The answers are voluntary, though he is admonished that his refusal or falsehood will operate—as they ought—unfavourably to the belief of his innocence, when he comes to be tried; and he is permitted to correct and alter, before he signs them, the answers which the magistrate takes from his lips.

Among the provisions that direct the mode of proceeding on the trial, is one giving the closing argument to the defendant. This was thought proper and just, because it is an advantage which, from necessity, one party may, and the other cannot, enjoy. There are disadvantages inseparable from the position of the accused; and to deprive him of what may, in some degree, counterbalance them, is thought by Mr. Livingston to be contrary to justice and humanity. The same may be said of a similar change which forbids a judge in his charge to recapitulate the testimony, unless expressly requested to do so by the jury, and obliges him to confine his statements exclusively to such matters of law as he shall think necessary for their information in giving their verdict.

The code concludes with a third book, containing forms for all the proceedings directed or authorised by its preceding parts. In framing them, which has been evidently done with much care, Mr. Livingston's object appears to have been to unite brevity with so much certainty and precision as will secure the party from any pos-

sibility of mistaking the precise fact of which he is accused. To attain this end is certainly to close the door against one of the greatest evils of criminal jurisprudence.

HAIR-BREADTH ESCAPES.—No. IV.

CAPTAIN BRADY AND THE INDIANS.

CAPTAIN SAMUEL BRADY was one of that band of brave men who lived in the trying days of the American Revolution, on the western borders, exposed to all the horrors and dangers of Indian warfare, and whose names should be perpetuated in history. He held a commission under the United States, and, for a part of the time, commanded a company of rangers, who traversed the forests for the protection of the frontiers. He was born in Sheppensburgh, in the year 1758, and removed, probably when a boy, into the valley of the Monongahela. At the period of this adventure, he lived on Chartier Creek, about twelve miles below Fort Pitt; a stream, better known, however, to the pilots and keel-boatmen of modern days, by the significant name of "Shirtee." He died in 1796, soon after the close of the Indian war. Samuel Brady, the hero of the following adventure, was about six feet in height, with light blue eyes, fair skin, and dark hair; he was remarkably straight; an athletic, bold, and vigorous backwoodsman, inured to all the toils and hardships of a frontier life, and had become very obnoxious to the Indians, from his numerous successful attacks on their war-parties, and from shooting them in his hunting excursions, whenever they crossed his path, or came within reach of his rifle; for he was personally engaged in more hazardous contests with the savages than any other man west of the mountains, excepting Daniel Boone. He was, in fact, "an Indian hater," as many of the early borderers were. This class of men appear to have been more numerous in this region than in any other portion of the frontiers; and this, doubtless, arose from the slaughter at Braddock's defeat, and the numerous murders and attacks on defenceless families that for many years followed that disaster. Brady was also a very successful trapper and hunter, and took more beavers than any of the Indians themselves. In one of his adventurous trapping excursions to the waters of the Beaver River, or Mahoning, which in early days so abounded with the animals of this species, that it took its name from this fact, it so happened that the Indians surprised him in his camp, and took him prisoner. To have shot or tomahawked him on the spot would have been but a small gratification, to that of satiating their revenge by burning him at a slow fire, in presence of all the Indians of their village. He was therefore taken alive to their encampment, on the west bank of the Beaver River, about a mile and a half from its mouth. After the usual exultations and rejoicings at the capture of a noted enemy, and causing him to

run the gauntlet, a fire was prepared, near which Brady was placed, after being stripped naked, and with his arms unbound. Previously to tying him to the stake, a large circle was formed around him, consisting of Indian men, women, and children, dancing and yelling, and uttering all manner of threats and abuse that their small knowledge of the English language could afford. The prisoner looked on these preparations for death, and on his savage foes, with a firm countenance and a steady eye, meeting all their threats with a truly savage fortitude. In the midst of all their dancing and rejoicing, a squaw of one of their chiefs came near him, with a child in her arms; quick as thought, and with intuitive prescience, he snatched it from her, and threw it into the midst of the flames. Horror-struck at the sudden outrage, the Indians simultaneously rushed to rescue the infant from the fire. In the midst of this confusion, Brady darted from the circle, outrunning all that came in his way, and rushed into the adjacent thickets, with the Indians yelling at his heels. He ascended the steep side of the present hill amidst a shower of bullets, and darting down the opposite declivity, secreted himself in the deep ravines and laurel thickets that abound for several miles to the west of it. His knowledge of the country, and wonderful activity, enabled him to elude his enemies, and reach the settlements on the south of the Ohio river, which he crossed by swimming. The hill, near whose base this adventure is said to have happened, still goes by his name; and the incident is often referred to by the traveller, as the coach is slowly dragged up its side.

Captain Brady seems to have been as much the Daniel Boone of the north-east part of the valley of the Ohio, as the other was of the south-west; and the country is equally full of traditional legends of his hardy adventures and hair-breadth escapes, although he has lacked a Flint to chronicle his fame, and to transmit it to posterity in the glowing and beautiful language of that distinguished annalist of the west. From undoubted authority, it seems the following incident actually transpired in this vicinity. Brady's residence was on Chartier's creek, on the south side of the Ohio, and being aman of herculean strength, activity, and courage, he was generally selected as the leader of the hardy borderers. In all their incursions into the Indian territory, north of the river. About the year 1780, on one occasion, a large party of warriors, from the falls of the Cuyahoga and the adjacent country, had made an inroad on the south side of the Ohio

river, in the lower part of what is now Washington county, but which was then known as the settlement of the "Catfish Camp," after an old Indian of that name, who lived there when the whites first came into the country, on the Monongahela River. This party had murdered several families, and, with the plunder, had re-crossed the Ohio, before effectual pursuit could be made. By Brady a party was quickly summoned of his chosen followers, who hastened on after them; but the Indians having one or two days the start, he could not overtake them in time to arrest their return to the villages. Near the spot where the town of Ravenna now stands, the Indians separated into two parties, one of which went to the north, and the other west, to the falls of the Cuyahoga. Brady's men also divided; a part pursued the northern trail, and a part went with their commander to the Indian village, lying on the river, in the present township of Northampton, in Portage county. Although Brady made his approaches with the utmost caution, the Indians, expecting a pursuit, were on the look-out, and ready to receive him, with numbers fourfold to those of Brady's party, whose only safety was in a hasty retreat, which, from the ardour of the pursuit, soon became a perfect flight. Brady directed his men to separate, and each one to take care of himself; but the Indians, knowing Brady, and having a most inveterate hatred and dread of him, from the numerous chastisements which he had inflicted upon them, left all the others, and with united strength pursued him alone. The Cuyahoga here makes a wide bend to the south, including a large tract of several miles of surface, in the form of a peninsula; within this tract the pursuit was hotly contested. The Indians, by extending their line to the right and left, forced him on to the bank of the stream. Having, in peaceable times, often hunted over this ground with the Indians, and knowing every turn of the Cuyahoga as familiarly as the villager knows the streets of his own hamlet, Brady directed his course to the river, at a spot where the whole stream is compressed, by the rocky cliffs, into a narrow channel of only twenty-two feet across the top of the chasm, although it is considerably wider beneath, near the water, and in height more than twice that number of feet above the current.

Through this pass the water rushes like a race-horse, chafing and roaring at the confinement of its current by the rocky channel, while, a short distance above, the stream is at least fifty yards wide. As he approached the chasm, Brady, knowing that life or death was in the effort, concentrated his mighty powers, and leaped the stream at a single bound. It so happened that, on the opposite cliff, the leap was favoured by a low place, into which he dropped, and grasping the bushes, he thus helped himself to ascend to the top of the cliff. The Indians, for a few moments, were lost in wonder and admiration; and, before they had recovered their recollection, he was half way up the side of the opposite hill, but still within reach of their rifles. They could easily have shot him at any moment before; but, being bent on taking him alive, for torture, and to glut their long-delayed revenge, they forbore the use of the rifle; but now, seeing him likely to escape, they all fired upon him; one bullet wounded him severely in the hip, but not so badly as to prevent his progress.

The Indians having to make a considerable circuit before they could cross the stream, Brady advanced a good distance a-head. His limb was growing stiff from the wound, and, as the Indians gained on him, he made for the pond which now bears his name, and plunging in, swam under water a considerable distance, and came up under the trunk of a large oak, which had fallen into the pond. This, although leaving only a small breathing-place to support life, still completely sheltered him from their sight. The Indians, tracing him by the blood to the water, made diligent search all round the pond, but, finding no signs of his exit, finally came to the conclusion that he had sunk and was drowned. As they were at one time standing on the very tree beneath which he was concealed, Brady, understanding their language, was very glad to hear the result of their deliberations; and, after they had gone, weary, lame, and hungry, he made good his retreat to his own home. His followers, also, all returned in safety. The chasm across which he leaped is known in all that region by the name of "Brady's Leap."—*American Journal of Science and Art.*

MENTAL AND MORAL EDUCATION OF CHILDREN.*

FIRST ARTICLE.

A MOMENT'S reflection will suffice to convince us, that the infant is scarcely born when it commences a process of learning. Its senses first receive a knowledge of the agents which act specifically upon them; the eye becomes ac-

quainted with light, the ear with sound, &c., and, subsequently, the infant learns to compare the different sensations, and to derive inferences from this comparison. Thus, the mother's nipple is soon recognised by the sense of sight; but it is at a later period that the information conveyed by the eye is corrected by the touch, so far as to enable the mouth or hands to be directed with

certainty towards the object in question. After a short period, the power of perceiving external objects, and the memory, is so far educated, that the infant can determine the differences between persons, and becomes capable of recognising its mother or nurse. All this is really mental education, and that too of the most important kind; for what a small proportion does the learning of the schools bear to the knowledge of external agents, and of our own powers and relations, which we must require during the period of childhood, and without which we should be incapable of supporting our own existence. We cannot, however, materially aid in the communication of such knowledge; the demands of the senses for their proper excitements will force it upon the young being; and we refer to it here, only to show that the young child who is permitted to use its eyes and ears, is always busily employed in learning, and that the hours of play are not to be considered as periods of intellectual idleness. At what time the business of formally instructing the intellect should be commenced, becomes an interesting question, and one upon which much difference of opinion exists: if we begin too early, we shall certainly injure the health; and if we delay too long, we shall often experience much difficulty in restraining the habits of bodily activity (which in such cases will generally be acquired) within limits favourable to the necessary exertion of the mental powers. In this, as in most other matters, we shall probably find our best guide, if we carefully observe the plans of nature. She seldom fails to implant in the child a most restless and prying curiosity, which is, in reality, the appetite for knowledge, and should never be denied its gratification.

Books and pictures never fail to attract the attention of very young children; and allowing them to apply it, at their own pleasure, to these, and especially to the latter, is precisely doing for the mind what we do for the body when we place it in the garden or field—it is giving it an opportunity of taking wholesome exercise, which it will cease from doing upon the first approach of fatigue. In the one case, the child will, itself, learn to walk and run with firmness; and as its muscles and bones become stronger, it will usually desire to learn the more artificial exercises of riding and swimming. In the other case, an acquaintance will be imperceptibly acquired with the forms of letters, and of animals, and other external objects; and the uses of the one being gradually learned, and a curiosity respecting the others being excited, a growing desire for information will lead the child to devote more and more time to its acquirement, until at length we shall find it no difficult matter to include among our periodical arrangements, a daily allotment of a short portion of time for the purposes of instruction. The precise age for

adopting this latter arrangement cannot be exactly defined—it must differ a little, according to the strength of the child—but we conceive it should not be before the sixth year. The time to be allotted for instruction is also a matter of moment: it should never be long enough to produce fatigue, and we think should not exceed two hours daily during any part of the period of childhood. By adopting such a plan as we have recommended, we allow a child to learn to think, which in reality is superior to knowledge; and we also give it an opportunity of obtaining materials for thought, by making an acquaintance, at its leisure, with the sensible properties of many objects. “We do not,” however, to borrow the words of an ingenious writer, “attempt to force their intellectual growth. Do not feed them with meat until they have teeth to masticate it. There is a great deal which they ought to learn, can learn, and must learn, before they can or ought to understand it.”*

So much for intellectual education: during the period to which our consideration is restricted, namely, the first eight years of life, it should rather be laid by such playful exercise of the faculties as we have sketched. A more important subject, however, is what we have designated as moral education. This commences at the earliest period of infancy, and we almost believe is finished, for good or for evil, before the individual passes from the period of childhood. In moral qualities, the child is, indeed, father to the man; and the education of these requires the most anxious attention, even during the earliest periods of infancy. No one who is familiar with the habits of infants can avoid observing, that, from the moment of birth, they display obvious marks of being-endowed with active passions and affections, and that, too, in very varying proportions in different individuals. Anger is perhaps the first which is displayed to our notice; but shame and jealousy soon make their appearance, and also some of a more amiable character, as compassion and brotherly affection. Now, we must recollect that these, and all the other elements of our moral constitution, are originally implanted in us, and designed for good. “It is very true,” says Dr. Chalmers,† “that the anger, and the shame, and the emulation, and the parental affection, and the compassion, and the love of reputation, and the sense of propriety, and the conscience, or moral sense, are so many forces of a mechanism, which, if not thus furnished, and that too within certain proportions, would run into a disorder that might have proved destructive both of the individual and the species.” We shall give an example of our meaning, and again in the words of the excellent writer just quoted: “The more patent view of anger is, that it is an

* “The Doctor,” a work generally attributed to Southey.
† Bridgewater Treatise.

instrument of defence against the aggressions of violence or injustice, and by which they are kept in check from desolating, as they otherwise would, the face of society." In like manner, all the passions and affections are designed for good; and we conceive, therefore, that our object in morally educating a child should be, not to obliterate those forces of his moral mechanism, but to guide them into a system of harmonious operation with each other. Now, how is this most likely to be accomplished? Is it not by cultivating those affections which are obviously

good, and, by their influence, lessening the violence of others, whose unrestrained indulgence would certainly lead to evil? Thus, the anger even of a very young infant will be best restrained, not by a display of anger upon the part of its parent, but by a steady exhibition of parental affection, and by showing it a practical example of calmness. Causes likely to excite irritability should be carefully removed from the infant; as a habit of indulgence in danger will readily be acquired before the counteracting affections can be correspondingly excited.

WHAT IS HOPE?

What is Hope? 'tis the joyous birth
Of a bright, impassioned, glowing feeling,
Clothing with beauty the things of earth,
And the darkening hues of life concealing.

What is Hope? 'tis a summer's morn,
Without a cloud of withering sorrow,
In the sunny vales of gladness born;
Bliss of to-day, bride of to-morrow.

What is Hope? 'tis a silvery ray
That shines thro' the darkened clouds of woe,
That lights up the gloom of Sorrow's day
When the streams of Affliction darkly flow.

What is Hope? 'tis the rapturous joy
That thrills thro' the lover's anxious breast,
As he marks the glance of his idol's eye,
When the thoughts of the heart are all expressed.

What is Hope? 'tis the Christian's stay,
A promise of nobler joys to come,
When the spirit shall burst from its "house of clay,"
And fly to its cloudless, heavenly home.

Hope's like the eagle, on high careering,
Earth cannot stay her aspiring flight,
Blossoms of bliss in her mantle bearing,
A sunbeam of joy! an angel of light!

Hope flings her beam when the waves are foaming,
And the trembler hails the welcome ray:
Hope cheers the heart of the wanderer roaming
O'er stranger lands, from his home away.

Oh! when the soul is oppressed with sadness,
Hope! let me feel thy enkindling power;
Shed forth the smile of joy and gladness,
Brighten the dark and the gloomy hour. T. W. A.

LIFE AND MANNERS.

BURNS.—"I well remember," says the Rev. Dr. Duncan, in his "Philosophy of the Seasons," "with what delight I listened to an interesting conversation which, while yet a schoolboy, I enjoyed an opportunity of hearing in my father's manse, between the poet Burns and another poet, my near relation, the amiable Blacklock. The subject was the fidelity of the dog. Burns took up the question with all the ardour and kindly feeling with which the conversation of that extraordinary man was so remarkably imbued. It was a subject well suited to call forth his powers; and, when handled by such a man, not less suited to interest the youthful fancy. The anecdotes by which it was illustrated have long escaped my memory; but there was one sentiment expressed by Burns, with his own characteristic enthusiasm, which, as it threw a new light into my mind, I shall never forget. 'Man,' said he, 'is the god of the dog. He knows no other, he can understand no other; and see how he worships him! With what reverence he crouches at his feet! with what love he fawns upon him! with what dependence he looks up to him! and with what cheerful alacrity he obeys him! His whole soul is wrapped up in his god; all the powers and faculties of his nature are devoted to his service; and these powers and faculties are ennobled by the intercourse. It ought just to be so with the Christian; but the dog puts the Christian to shame.'"

GOLDSMITH.—"A few months," writes Mr. Montagu, "before the death of Dr. Scott, author of 'Anti-Sejanns,' and other political tracts in support of Lord North's administration, I happened to dine with him in company with my friend Sir George Tuthill, who

was the doctor's physician. After dinner, Dr. Scott mentioned, as matter of astonishment, and a proof of the folly of men who are, according to common opinion, ignorant of the world,—that he was once sent with a *carte blanche* from the ministry to Oliver Goldsmith, to induce him to write in favour of the administration. 'I found him,' said the doctor, 'in a miserable set of chambers in the Temple. I told him my authority; I told him I was empowered to pay most liberally for his exertions; and would you believe it, he was so absurd as to say, 'I can earn as much as will supply my wants without writing for any party; the assistance, therefore, you offer is unnecessary to me;' and so I left him,' added Dr. Scott, 'in his garret.'"—*Prior's Life of Goldsmith.*

EARLY RISING.—There is something peculiarly arousing and strengthening, both to the body and the mind, in this early time of the morning; and were we always wise enough to avail ourselves of it, it is almost incredible with what ease and pleasure the labours of the most diligent life might be performed. There is an awakening of the mind in the morning which cannot be obtained at any other time of the day; and they who miss this go heavily about their employments, and an hour of their drawing day is not equal to half an hour of the energetic day of one who sees the sun rise. When, too, we take the day by the beginning, we can regulate the length of it according to our necessities; and whatever may be our professional avocations, we have time to perform them, to cultivate our minds, and to worship our Maker, without any one duty in the least interfering with the other.—*Mudie's Spring.*

A BAPTISM OF THE SCOTTISH KIRK.

THE rigid members of the Kirk of Scotland have decided objections to the word "christening," and therefore they do not admit it into their sacerdotal vocabulary. They have two reasons for excluding it: in the first place, they do not admit that a mere ceremony, be it performed with what solemnity it may, can be instrumental, that is, efficacious in itself, in bringing the party upon whom it is performed into the real Church of Christ, at what age soever it may be performed; and, in the second place, they consider that no ceremony can have any effect, good or evil, upon an infant of only a few days old, in which the first rudiments of observation and judgment are not yet developed. It is true that the father, or some one in the father's stead, if he is lost to the family, or absent, stands a sponsor, or "takes the vows upon him," as it is termed; but these vows, though understood to be solemn and binding in the highest degree, are taken for the sponsor himself and not for the child: they are a pledge, before the assembled congregation, or the family and friends, as the case may be, that the child shall be trained up in the paths of morality, and instructed in the principles, and, if possible, imbued with the spirit of genuine Christianity. Baptism, according to the observance of the Scotch kirk, is, therefore, though a solemn rite, an exceedingly simple one; and it is only when there are peculiar circumstances attending a particular case that that case can be made the subject of written description. While the clannish spirit existed so strongly among the Highlanders as to have considerable influence upon the conduct, the baptizing of a child, especially an heir to the feudal honours, was a season of great rejoicing. The child was borne by the most honourable retainers of the chief, upon a sort of couch, woven of fresh twigs and the leaves of the tree of the clan, with bagpipes playing, and banner displayed, and it was held upon this while the clergyman performed the ceremony. Then followed a great feast, which often lasted for a succession of days, and not unfrequently ended, as most clan gatherings used to do, in brawling and bloodshed. The writer of these lines remembers having seen the young heir of the late Macdonald, of Glengary, paraded in this way through the streets of Inverness, upon heather, the characteristic tree of the clan.

In the lowlands of Scotland, baptisms of the poorer classes are usually administered at the close of the afternoon sermon, preceded by an invocation, accompanied by an explanation of the nature of the rite, and an enforcement of the duties of Christian parents, and then the whole closes with an admonitory prayer. The entire service is oral, and by this means it can be adapted to the case of the individual parties, for admonition,

for reproof, or for encouragement, according as might be thought necessary. In this way, it is not only rendered effective to those immediately concerned, but it is impressive upon the entire congregation; and though it is no necessary part of the regular duties of the Sabbath, it is far from being uninstrusive in addition to it.

Among the more opulent, this baptizing in the church, before the assembled congregation, is not common; and there are no meetings at church, either public or private, for baptisms only. Accordingly, the children of the wealthy are baptized in their own houses. This is not, we believe, in strict accordance with the more rigid formulary of presbyterianism, but "danger to the child from exposure to the air," is easily pleaded, and readily admitted in any case where it might be necessary.

We must admit that there is something of use, in a family point of view, in these domestic baptisms. The whole household, including the servants, are present at the administration, and generally the relatives of the parents in considerable numbers. The invocation and the prayers are longer than in the church; and the minister adapts them to the parties, to the place, and to the season. Then follows the feast, at which, of course, the minister says grace, and contributes not a little both to the instruction and to the hilarity of all present; but, as this is a time of unbending the mind, the different classes of those who had assembled as one family during the sacrament, separate, in order that none may act as a restraint upon others, but that all may partake freely and fully in the general joy that another member has been added to the family, and while the hope is fresh that another human being shall be added to the family of the redeemed in heaven.

In towns and crowded places, this observance produces little external effect, unless there is something remarkable in the case; but in the country it is looked forward to with fond anticipation, and remembered with delight. This is especially the case among a certain class of farmers that are very abundant in at least one of the lowland counties of Scotland. These are, generally speaking, farmers upon a pretty large scale, proprietors of all that they cultivate, and living well and happily with every one around them. On some part of the farm, generally not far from the homestead, there is a little village, the inhabitants of which have been fixtures for generations. The able-bodied men are ploughmen and other servants; as many of the women as are required for the household and the dairy live "at the place," as it is called; the old men are useful for something; and the aged women and children are in requisition at those times when work

thickens. In the summer, the children lead cows by the hedge-sides and lanea, where there is usually good grass, but grass that would not repay formal collecting by the proprietor. Each family has, moreover, a little bit of garden, often very pretty with flowers, and not a few of them rent little portions of land for the year, repaying it in labour; and on this there are potatoes, flax, and other vegetables for family use. Where this is to any extent the case, pauperism is altogether unknown, crimes of any kind are rarely heard of; and there is only a little public-house here and there by the road-side, seldom frequented, except by wayfaring people, and always secondary to some other employment on the part of the inhabitant.

In such a district as this, the baptizing of a child, especially of a son and heir, and yet more especially if that son and heir is a child of delayed hope, is an event of some importance in the simple annals of the place.

Mungo Morton, of Morton Bank, (for he was only Mungo Morton, Esq., when the candidate applied for his vote at an election,) belonged to this class of proprietary farmers. His family had possessed the land time out of mind; but his father had been drawn into some speculations which, though they did not actually involve him in debt, brought him very near to it. Mungo had three sisters, and the father had willed to each of these a yearly allowance, to be paid out of the produce of the farm. The amount was not absolutely ruinous, but it placed Mr. Morton upon less advantageous terms than his neighbours around him.

Mr. Morton had just completed his thirtieth year when he was called upon to perform the mournful duty of accompanying an aged and excellent father to the family place of interment, in the parish churchyard, and seeing his body deposited in the same grave which had received the mortal remains of his mother, fifteen years before. He was left with very little ready money, and with the farm burdened, as has been stated; but the farm was excellent land, in the highest order, and completely stocked; he was also well acquainted with the management of it, as the active part of the business had devolved upon him for ten years, and the old man had passed the evening of life at his ease, and died in peace with God and man.

Mr. Morton was of rather staid deportment, a little too grave, perhaps, for a young man of thirty; but he had been better educated than most of his neighbours, and was looked up to as a person whose advice was very desirable, even to those who were his seniors. The sisters, whose dispositions were rather gayer than that of the brother, voluntarily took up their residence at a small seaport in the neighbourhood, well known as a retreat for ladies at their time of life, all of them being elder than their brother. The allow-

ance which their father had left them was regularly supplied, they lived comfortably, and though the intercourse between them and their brother was not very close or constant, they were on the best of terms, and never had a dispute or misunderstanding.

When Mungo Morton was left alone on his farm, his first object was to devise means of disencumbering it of the payments to his sisters, without diminishing their means of living. Only one way of doing this occurred to him, but it was to work the farm to the utmost and most profitable extent, and save as much as ever he could. His servants had had experience of him as a strict, but kind and upright master, and, therefore, they were one and all ready, willing, and able to second his exertions in the most effective manner. He was very successful; and, acre for acre, his farm was the most productive in the neighbourhood, and its produce the best in quality. Generally speaking, he was the earliest up; and he was here, there, and every where, instructing and encouraging every body, and reproving or quarrelling with none. It used to be said, that Morton of Morton Bank was always the first at market, and the first home; that the very weather seemed to smile upon his farm more than upon other farms; and that, in some instances, his work appeared to do itself.

A man in the prime of life and vigour, possessing such thriving habits, and thriving so well in the exercise of them, could not fail to draw various kinds of attention. The first proposition made to him came from the minister, to give the benefit of his discretion in the kirk-session as an elder, as his father had done, and continued to do until the decay of nature rendered him incapable. This office was accepted, and Mr. Morton was diligent in the performance of the few and light duties which it required; and as there were no regular poor, he endeavoured to turn the voluntary charity of the parish to the improvement of the parochial school, and the winter relief of the more necessitous part of the labourers. Doctor Drum, the minister, loved his parish, and was an honour and a blessing to it; and he did not hide the light of his new elder under a bushel.

Mr. Morton thus very soon became a man of note, not merely in his own parish, but in the district generally; and being a man of note and a bachelor are two possessions which it is not easy for the same individual to enjoy undisturbed. It was against the latter possession chiefly that the movement was made in the present case, and matrons who had marriageable daughters, when met together, unanimously resolved, "that Mr. Morton ought to have a wife." Many rumours were put afloat as to who ought to be Mrs. Morton, but they all speedily died away. His brother freehold farmers, and their wives,—they were not called ladies in these parts, for "lady," in their

vernacular tongue, means a useless female, or one who does nothing, and the dames in question, who were, generally speaking, notables, had many consultations as to the kind of hook wherewithal Mungo Morton, Esquire, of Morton Bank, might be drawn out of the still waters of celibacy, and floated to the end of his days on the gentle ripple of the matrimonial tide. Wealth, personal attractions, mental accomplishments, connexions, and all the cords by which a man might be supposed to be drawn into honourable love, were brought forward, according as the speculating party had the means of commanding the one or the other.

It is even said, though we do not absolutely vouch for the fact, that a closer siege was laid to the stubborn fortalice of the heart of the prudent and prosperous yeoman. There is a silent and wary method, in that part of the country, of giving a hint that love may be made without any great offence to the object of it. This is locally termed "footie," and is held sacred to purely hymeneal purposes: it consists in getting seated on the opposite side of the table to the party to be hinted at, and giving that party, when otherwise unoccupied, a gentle pressure on the foot. If no notice is taken, the matter ends here; but if the pressure is returned, there is broken ice, and in the fullness of time a marriage. It was whispered—for on such matters they never speak out—that footie had been practised on Mr. Morton more than twenty times, but that he remained steady as the pole, and cold as the winter of its extremest latitudes. This cast a damp upon the speculations; and they were ultimately reduced to a single wonder—how strange it is that Mr. Morton does not pay his addresses to any body! In the meantime Mr. Morton had another object in rapid progress to its accomplishment, but, until that was reached, he firmly resolved not to make even the slightest tender of a matrimonial alliance, or to throw out a hint that could be so interpreted by the most willing mind. To free the estate from all encumbrance, and still to continue to his sisters their allowance, was his object, and he found, or fancied that he could accomplish it most speedily and most agreeably, if unencumbered by any other connexion. Nine abundant crops had been gathered in, carried to market, and profitably sold, under his management; and in the spring of the tenth year he found that he had saved enough, not only to purchase annuities for his sisters, but to buy stock, the dividends of which fully amounted to the payments required by the father's will. The stock was bought and transferred; the sisters were changed from annuitants to freeholders; and Mr. Morton rode home to the farm, all his own, and a surplus of money still remaining in his pocket. Had this been known, it would certainly have awakened the speculations, and might possibly have brought on footie again; but Mungo Mor-

ton did not blow a trumpet before him, and so tongues were mute and feet stationary.

There was, indeed, one little circumstance which caused a slight inquiry, not very long after this time. Mr. Morton's house was thoroughly repaired and painted; a good deal of new furniture was brought to it; and he gave a dinner party to about a dozen of his neighbours, including the minister. No lady was there, however, nor could the most willing to dispose among the assembled fathers trace the least tendency to matrimony in the conversation or the conduct of Mr. Morton.

Two or three Sundays after, there was a discovery, however, though what was discovered was no great matter. Miss Mary Hay, by far the best educated woman in the neighbourhood, though misfortune had overtaken her family, and she had no fortune except a small annuity from a brother in India, had resided with her mother, in a neat little cottage, situated in a very pleasant village, about midway between Mr. Morton's house and the parish church. In earlier life Miss Hay had been very beautiful, and though the mere bloom of youth was over, and she was now considerably turned of thirty, she was a female of prepossessing appearance, and understood to be of delightful manners, as far as these were known. She attended church very regularly, and carried her little Bible in her cambric handkerchief, sometimes in her hand and sometimes under her arm. On this particular Sunday, as she was walking from church, a little in advance of Mr. Morton, the Bible dropped on the ground. Mr. Morton took it up and delivered it to its owner, bowing at the same time; and Miss Hay bowed in return, as more than ten witnesses could certify: not only this, but they walked on together until their roads separated, Mr. Morton again touching his hat, and bowing at parting, and Miss Hay bowing in return, and, it was positively averred, waving her handkerchief. It was Sunday, and the people then and there were very strict in their religious observances; but this was too much to keep for a night, and, consequently, there were divers associatings and communings on the subject.

The week was one of wonderment, that all the youth and all the wealth of the neighbourhood should have been passed over for Mary Hay; and by Saturday evening the ultimate conclusion was arrived at, "that Mungo Morton, of Morton Bank, was out of his senses." The next day made matters worse; for no sooner had the congregation assembled, and the precentor taken his place in the desk, than he read with an audible voice the following momentous words: "There is a purpose of marriage between Mungo Morton, Esq., of Morton Bank, and Miss Mary Hay, both of this parish, proclaimed for the first, second, and third time; if any person can show cause why these parties should not be joined in lawful wedlock, let them

come forward and state the same, time and place convenient." Neither Mr. Morton nor Miss Hay appeared at the parish church that Sunday; the marriage was performed privately on the Monday morning; and Mr. and Mrs. Morton drove off for a jaunt of a few weeks, leaving their neighbours to excite each other's wonder. To the parties themselves there was of course no wondering: it was a betrothment of nearly ten years standing; but Mary agreed with her future husband, in the prudence of delaying their union until the farm was clear from encumbrance, and all in a fair train for substantial and prosperous enjoyment.

Upon their return, the usual entertainments were given and exchanged, and Morton and his Mary very soon became ornaments to the district, and a blessing to every one who required either their advice or assistance.

At this period the cup of human bliss appeared to be full to Mr. Morton. He was prospering more and more every day in his circumstances, he was married to the woman he had long loved, and he was not merely respected, but looked up to by all who knew him; but the cup of human bliss is seldom full in this life, or, if it be, there is always sure to be some bitter drop in it. This is no doubt wisely ordained, as leading the thoughts of man to another and a better world as the haven of his rest, and the home of his enjoyment. But notwithstanding this, the bitter drop is hard for the frailty of human nature, and not unfrequently the more difficult to be borne the smaller it is in proportion to the whole. There was every comfort, and every source of happiness within and about the dwelling of Mr. Morton; but three years passed away and he remained childless. His wealth was increasing every day, his sisters, now advancing into years, had become

confirmed in their celibacy; and, carefully as he husbanded the family property, it seemed as if he was to be the last of the Mortons, of Morton Bank, and the fruits of his industry and skill were to go to he knew not who; but—

The fourth year changed the aspect of things in this respect; and after a period of considerable anxiety a fine healthy boy was born. The fondest earthly wish of the parents was now realised, and the baptizing of young Morton was to be an especial festival in the family. It was delayed until the mother could be present, and take her place as the entertainer; and so much did Morton's neighbours esteem him, and sympathise with him in his joy, that it was a holiday in the parish; the bell was kept constantly tolling, and a bonfire was lighted up on the hill; labour was suspended, and those who could not find room in the premises of Mr. Morton feasted and made merry in other places.

Doctor Drum was not the least happy upon the occasion, and he gave expression to the first emotions of his happiness in grateful acknowledgment to that Being who had gratified the wishes of so deserving a pair. His addresses and prayers were longer and more fervent than is usual on ordinary occasions, and he contrived to frame them so as to convey wholesome instruction and sound advice to all persons.

After the religious rite came the feast, the table being surrounded by as many of Morton's neighbours, and the grown-up part of their families, as could find room; while the juvenile branches dined in another apartment, under the superintendence of the parish schoolmaster: the feast was abundant, the guests happy, and "all things done decently and in order."

LADY HESTER STANHOPE.

CHAPTER III.

A BLACK slave entered, and, bowing himself before her with his forehead on the ground, and the hands over the head, addressed to her some words in Arabic. "Go," said she, "your dinner awaits you; return quickly. I shall think of you, and endeavour to see and distinguish more clearly, in the confusion of my ideas, somewhat more of yourself and your future fate. I eat with no one. I live very soberly, on bread and fruits, at the hour when want requires it; these are sufficient for me, but I must not put my guest on my regimen."

I was conducted into a summer-house overhung with jessamine flowers and laurel-roses, at the gate of the gardens. There were covers laid for myself and my friend. We dined quickly, but she waited not till our repast was ended before she sent Leonardi to say that she awaited me.

I found her smoking from a long oriental pipe, one of which she ordered for me. I had been already accustomed to see the most beautiful and elegant women of the East smoke, and I saw nothing to shock the senses in the attitude of the figure, so gracious and *nonchalant*, nor in the odorous vapour which, in slender columns, escaped from the lips of that lovely woman, interrupting without cooling the conversation. We thus conversed for a long time, and always on the favourite subject—on the only and mystic theme of this extraordinary woman, this modern magician; recalling the apt resemblance of the famous magicians of antiquity—the *Circé* of the deserts.

It appeared to me that the religious doctrines of Lady Hester consisted of a skilful though confused union of different religions, amidst which she has condemned herself to live as myste-

riously as the Druzes, of whose mystic secret she may be perhaps the sole depositary; resigned as the Mussulman, and, like him too, a fatalist; awaiting, with the Jew, the advent of the Messiah; and, with the Christian, professing the worship of Christ, and following the practice of all charitable morality. Add to these, the fantastic colourings and the supernatural dreams of an imagination tinged with the East, and warmed by solitude and meditation—some revelations, perhaps, from the Arab astrologers—and you will be enabled to form some idea of that lofty and fantastic union of feeling which it may be more correct to denominate folly, than to analyse or comprehend. And yet there is nought of foolish or disordered feeling about her. Folly, which is written in such evident characters in the eyes, cannot be detected in her regard, so noble and so direct. Folly, which always betrays itself by some involuntary interruption of a chain of conversation, by rough, disordered, and eccentric digressions, never shows itself in the conversation or language of Lady Hester, which, though lofty, mysterious, and wavering, is yet sustained, and ever in union with its object. Were I to pronounce an opinion, I should rather say that her folly (if it deserve such a name) is both voluntary and studied, and is known to itself; and for the assumption and support of which, reasons and causes might be assigned. The powerful admiration that her genius has exercised, and still exercises, over the Arab population around the mountains, sufficiently proves that her apparent folly is but a medium, and not an end. Amongst the inhabitants of that wonderful land, amongst those tribes of the rocks and the deserts, whose imaginations are more darkly coloured than the horizon of their sands or their seas, it requires either the word of Mohammed or Lady Hester Stanhope. It requires, also, the communion with the stars, with prophecies, or with miracles—the second-sight of genius. Lady Stanhope has entered into and understood these mystic theories, first, by the lofty bearing of an intellect naturally of a superior order, as well as, in the second place, seducing, as it were, herself (the power only of high intellectual faculties) into the first neophytic belief of that symbolism which she had intended to create only for others.

Such is the effect which this woman has produced upon me. You cannot classify her, or judge her by one word; she may be considered as a statue of vast dimensions, only looked upon to advantage in one point of light. I should not be surprised if a future day were to fulfil the realisation of a portion of that prophetic fate which she designs for herself—an empire in Arabia, and a throne in Jerusalem. The slightest political commotion in the region of the East which she inhabits might lift her up to this height. On this subject I remarked to her, that

I had only one reproach to make to her genius, it was that of being too timid during the development of stirring events, and of not having pushed her fortune onwards where it would have conducted her.

"You speak," said she, "as a man who reposes too much reliance in the power of the human will, and not sufficiently on the alone and irresistible empire of destiny. My strength in myself relies on that. I await it, I do not summon it; I watch. I have diminished my fortune greatly. I am now alone and abandoned to myself on this desert rock, a prey for the first daring soul that forces my gates; surrounded by a band of faithless domestics and ungrateful slaves, who despoil me daily, and sometimes threaten my life. Even lately I only owed my safety to this poniard, which I was forced to use to defend myself against a black slave whom I have brought up. Yet, in the midst of all these tribulations, I am happy. I reply to all by that sacred word of the Mussulmans—*Allah kerim!* 'the will of God;' and I await with confidence the advent of that futurity of which I have spoken to you, and of which I was anxious to inspire you."

After having smoked several pipes, and drank several cups of coffee that were brought in by the negro slaves every quarter of an hour, "Come," said she, "I am going to conduct you into a sanctuary wherein I suffer none profane to enter; it is my garden."

We descended to it by several steps; and I wandered with her in perfect enchantment through one of the most beautiful Turkish gardens that I had ever seen in the East. There were shadowy arbours, whose vaulted verdure was lit by the shining clusters of the grapes of the promised land; kiosks, whose arabesque sculptures were interlaced by the jasmine and the clinging convolvulus of Asia; marble basins, where artificial waters, brought there from a league's distance, were murmuring and softly gushing; walks, along which were planted English and European fruit-trees, as well as those native to the soil; greenswards, sown with rich flowering shrubs; whilst marble compartments enclosed sheaves of flowers, whose rare beauty I had never before beheld. Such was this garden. We rested frequently in one or other of the ornamental kiosks, whilst the inexhaustible conversation of Lady Hester never left the mystic or elevated tone of subject on which she had conversed in the morning.

Before ending her conversation she more particularly addressed me.

"Since destiny has sent you here, and that a wondrous sympathy between our stars permits me to confide to you that which I would never confide to other profane minds, come with me, and you shall behold with your own eyes a prodigy of nature, whose ulterior destination is

known but to me and to those who are versed in the mysteries of the same science; the prophecies of the East had announced it for ages back, and you shall judge yourself whether these prophecies have been accomplished."

She opened a gate of the garden which led to a small interior court, where I saw two splendid Arabian mares, of the finest race and the most beautiful forms.

"Approach and view this bay mare, and see whether nature has not fulfilled in her all that is written of the one that is to bear the Messiah."

She was born ready saddled. I saw, in fact, in this fine animal, a diversion from the usual course of nature sufficiently rare to delude the vulgar credulity of a semi-barbarous people. This mare had, instead of a well-developed shoulder, a cavity so large and deep, and imitating so closely the form of a Turkish saddle, that it might be truly said that she was born ready saddled; and with stirrups she might easily have been mounted without requiring a saddle. This mare, noble as she was, seemed accustomed to the admiration and respect which Lady Stanhope and her slaves showed for her, and to presage all the dignity of her future mission. No person has ever mounted her, and two Arab grooms kept a constant watchful care over her, without losing sight of her for one instant.

Another white mare, in my opinion infinitely the finer of the two, partakes with the other of the respectful cares of Lady Stanhope; she has likewise never been mounted. Lady Hester did not inform me, but left me to understand, that although the destiny of the white mare was a less holy one, she had, nevertheless, a mysterious and important one to fulfil; and I was given to understand that Lady Stanhope reserved it to mount herself, on the day when she would enter the reconquered city of Jerusalem by the side of the Messiah.

After these animals had walked for some time on a greensward without the walls of her fortress-habitation, and we had remarked the softness and grace of their steps and motions, we re-entered, and I renewed to Lady Hester my requests that she would permit me to introduce to her my friend M. de Parseval, who had accompanied me in my journey, and had followed me, in spite of my remonstrances, to her abode, and had been awaiting since the morning for that favour of which Lady Hester was so sparing. Eventually she consented, and we all three entered to pass the evening, or rather the night, in the little room I have already described. Coffee and pipes were supplied again, with oriental profusion, and the room was soon filled with such a cloud of smoke that the form of Lady Stanhope was only seen through an atmosphere similar to the magical atmosphere of incantations. She spoke again with the same power, grace, and freedom, but with infinitely less of the super-

natural, on subjects which bore to her a less serious influence, than she had ever done to me previously.

"I hope," she said suddenly, "that you are an aristocrat, and, in looking at you, I do not doubt it."

"You are deceived, my lady," I replied, "I am neither an aristocrat nor a democrat; I have lived long enough to view the two sides of the medallion of humanity, and to find the one as hollow as the other. I would exclusively support and become a partisan of that class which could perfect and ameliorate the general mass of mankind, whether it be that portion which occupies the summit or the foot of the social ladder. I am neither for the mass of the people, nor for the exclusive great, but for the entire mass of humanity; and I believe that the virtue which will bring perfection into the world belongs neither to aristocratic nor democratic institutions, and that it is only to be found in a divine morality, the fruit of a perfect religion. The civilisation of a people is their faith."

"That is true," replied she, "but I am nevertheless an aristocrat in spite of myself. And you will agree," added she, "that if there are vices amongst the aristocracy, there are also lofty virtues beside them to retrieve and compensate for them; whilst, in a democracy, I see many of the basest and envied vices, but I look in vain for lofty virtues."

"My lady," I replied, "it is not precisely thus. In each of these divisions of society there are vices and virtues; but in the higher classes the very vices present a brilliant aspect; in the lower classes, on the contrary, those vices show themselves in all their nakedness, the very contemplation of which becomes injurious to the sentiments of morality. The difference is in the appearance alone, and not in the fact; but, in reality, the vice becomes more hideous and vicious when developed in the person of one who is rich, lofty, and instructed, than in one who is without bread to suffice him, or guiding light of any kind to direct him; for in the one, vice is the result of choice, in the other, the result of necessity. Despise it, therefore, wherever it is found, especially amongst the vicious aristocracy; and do not let us judge of humanity by the tribes of men, but by man himself. The great would possess the vices of the people if they were them; and the lower classes would possess the vices of the great if they were in their places. The balance is equal, let us not weigh it."

"Well," she replied, "let us pass on; but allow me to indulge in the belief that you are an aristocrat like myself; it would cost me too much to believe that you were of the number of those young Frenchmen who raise the popular violence against all the considerations which God, nature, or society have made to govern the world, and throw down the edifice but to build

up from its ruins a pedestal to their envious baseness."

"No," I said, "do not distress yourself, I am not one of them; I belong only to those who despise, not those who occupy an inferior position to themselves in the social state, respecting, at the same time, that which is above them, but whose desire or dream would be to lead all men—independent of the station they occupy in the arbitrary hierarchies of political government—to the same light, the same liberty, and the same moral perfection. And since you are of a religious disposition, and believe that God loves equally all his children, and that you await the advent of a second Messiah, who shall redress all things, you believe with them and with myself."

"Yes," replied she, "but I think no longer of human politics; I have seen too much of them during the ten years that I passed with my uncle Mr. Pitt, and whilst all the intrigues of Europe were around me. Whilst young I despised human nature. I wish to hear no more of it. All that man does for man is barren. The forms are to me perfectly indifferent."

"And to me also," I replied.

"The basis of all things is God and virtue."

"I think exactly as you do," I replied, "therefore let us dismiss the subject, as we agree in it."

Passing to lighter subjects, and jesting her on that species of divination which enabled her to know a man by his first aspect, and by the simple observation of his star, I put her wisdom to the proof, and I questioned her relative to several travellers whom I knew, and whom, within fifteen years, she had seen. I was struck with the justness of her observation on the *coup d'œil* of two of these. Amongst other things, she analysed, with great intellectual perspicuity, the character of one of these whom I well knew, and whose disposition was very difficult to detect at first sight; it was great, but hid beneath the simplest and most seductive appearances of good nature. And what completed my astonishment most, and rendered my admiration of her inflexible memory greater than it had ever been, was, that this traveller had only passed two hours with her, and that sixteen years had elapsed between his visit to her and the opinion that I

asked of the impression which she had received of him. Solitude strengthens and concentrates all the faculties of the soul. This has been marvellously well understood by the prophets, saints, the great men, and the poets, and their natures have taught them to seek for the desert or for isolation amongst mankind.

The name of Bonaparte fell, as it always does, into the thread of the conversation.

"I thought," I said, "that your enthusiasm for this man would have placed a barrier between us."

"I was an enthusiast only," she said, "on the subject of his misfortunes, and his pity for himself."

"Such were my feelings also," I replied, "and here we again agree."

I could not comprehend how a moral and religious woman could admire force alone, without either liberty, morality, or religion. Bonaparte, doubtless, repaired the social world, but he did not sufficiently regard the elements of which he re-composed it; he built up his statue with sand and personal interest, instead of mingling into its composition those divine and moral sentiments—virtue and liberty.

The night thus passed away, by wandering over freely, and without any affectation on the part of Lady Hester, all those subjects that words bring and carry away in a ceaseless conversation. I felt that no chord was wanting to perfect that firm and lofty intellect, that every key-note gave back a perfect, strong, and full sound, except, perhaps, the metaphysical chord, that tension and solitude had rendered hollow, or elevated to a diapason scale too lofty for mortal intelligence.

We separated with a sincere regret on my part, and with the same obliging sentiment from herself offered to me in return.

"No 'farewell,'" said she, "we shall see each other again often in this journey, and more frequently still in others which you have not even yet projected. Go and take your rest, and remember that you leave a friend behind you in the solitudes of Lebanon."

She gave me her hand, I put mine on my heart, after the manner of the Arabs, and we went out.

WILLIAM WORDSWORTH.

THIRD ARTICLE.

WEAR the effect produced on our minds by the perusal of the poetry of this gifted man other than it is, we should still feel some memory of past recorded pleasure spring up freshly within our thoughts at the mention of his name; but it has become to us as the presence of the fruit of the "Tree of Life." We feel when perusing his poetry the certain knowledge within

our minds, that the hours and days (and were we, according to Cocker custom, to count all these up, they would really amount to no insignificant span of time) which we have passed in the reverent study and contemplation of the poetry of this gifted man, have been numbered in "The Diary of a Lover of Poesy" as amongst the very happiest of our past lives. Past! the word is

"like a knell," tolling back the memories of departed hymns and songs once more to our ears, and filling the air with the solemn chorus of funeral bells and music. It reminds us that the hours of youth and hope are gone from us in this world for ever—that the quiet, green pathways of our earlier life are past, and that we have entered now upon the broad highway of life—that we are mingling with the crowded thousands who throng the busy streets and courts of the great city of the world, amid whom the din and traffic of business, "and success in life," are, alas! in too many instances, the only things thought of; and that the "one thing needful" is forgotten entirely, and blotted out from the mental page of remembrance.

Will you pardon us here, gentle reader, if, in our examination of the works before us, we diverge for a while, to bid you bear us company in the perusal of some thoughts on that subject which we have just paused to contemplate: we allude to "The Departure of Youth." On this subject, an elegant writer, and one whose powerful admiration of Wordsworth's works is great, thus writes:—

"It is the prime of our manhood which is the departure of our youth. To reflective and lofty minds, accustomed to survey, and fitted to comprehend the great aims of life, this is a period peculiarly solemn and important. It is a spot on which we ought to rest a while from our journey. It is the summit of the hill, from which we look down on two even divisions of our journey. We have left behind us a profusion of bright things: never again shall we traverse such fairy fields with such eager hopes; never again shall we find the same

"Glory in the grass, or splendour on the flower."

"The dews upon the herbage are dried up:
The morning is no more."

"We made a posy while the Time ran by;

* * * * *
But Time did beckon to the flowers, and they
By noon most cunningly did steal away,
And wither in the hand."

We ought then to pause for a while—to review the past—to gather around us the memories and warnings of experience—to feel that the lighter part of our destinies is completed—that the graver has begun—that our follies and our errors have become to us the monitors of wisdom; for since these are the tributes which Fate exacts from Mortality, they are not to be idly regretted, but to be solemnly redeemed. And if we are penetrated with this thought, our past becomes the mightiest preacher to our future. Wisdom is an acquisition, purchased in proportion to the disappointments which our own frailties have entailed upon us.

"This is, above all, an age which calls upon us to ponder well, and thoughtfully, upon the articles of our moral and our religious creed.

Entering more than ever into the mighty warfare of the world, we should summon to our side whatever auxiliaries can aid us in the contest—to cheer, to comfort, to counsel, and to direct. It is a time seriously to analyse the confused elements of belief—to apply ourselves to such solution of our doubts as may be afforded us. Happy he who can shelter himself with confidence, under the assurance of immortality, and feel 'that the world is not an inn but a hospital—a place not to live, but to die in;' acknowledging 'that piece of divinity that is in us—that something that was before the elements, and owes no homage to the sun.'

"Happy, thrice happy, he who relies on the eternity of the soul, who believes, as the loved fall one after one from his side, that they have returned 'to their native country;' that they await the divine re-union; who feels that each treasure of knowledge he attains he carries with him through illimitable being; who sees in Virtue, the essence and the element of the world he is to inherit, and to which he but accustoms himself betimes; who comforts his weariness amidst the storms of time, by seeing far across the melancholy seas the haven he will reach at last; who deems that every struggle has its assured reward, and every sorrow has its balm; who knows, however forsaken or bereaved below, that he never can be alone, and never be deserted; that above him is the Eternal Power, and the mercy of Eternal Love! Well said the dreamer of philosophy, 'How much he knew of the human heart who first called God *our Father!*'" *

In our former articles we have made reference more particularly to that peculiar simplicity of mind, character, and thought, which form so prominent an index in the writings of Wordsworth; we have quoted those among his poems in which he speaks of the simple manners of mankind, and uses their own very simple words and language; yet over which he has thrown a colouring of rich and glorious imagination, beautifying and embellishing the whole with the vivid shining of a summer's sunrise.

But there are many beautiful odes in these volumes, which display a loftier manner; still the inherent gems of the poet's proud and fertile imagination, and the two following poems—odes we should more properly call them—will furnish full and abundant evidence of the corroborative truth of our remarks:—

VERNAL ODE.

"*Rerum natura tota est nusquam magis quam in minimis.*"

Plin. Nat. Hist.

I.

BENEATH the concave of an April sky,
When all the fields with freshest green were dight,
Appeared, in presence of the spiritual eye,
That aids or supersedes our grosser sight,

* The Student. By E. L. Bulwer.

The form and rich habiliments of One

Whose countenance bore resemblance to the sun,

When it reveals, in evening majesty,

Features half lost amid their own pure light :

Poised, like a weary cloud, in middle air

He hung ; then floated with angelic ease,

(Softening that bright effulgence by degrees,)

Till he had reached a summit sharp and bare,

Where oft the venturous heifer drinks the noon-tide breeze.

Upon the apex of that lofty cone

Alighted ; there the Stranger stood alone,

Fair as a gorgeous fabric of the east,

Suddenly raised by some enchanter's power,

Where nothing was ; and firm as some old tower

Of Britain's realm, whose leafy crest

Waves high, embellished by a gleaming shower !

II.

Beneath the shadow of her purple wings

Rested a golden harp ; he touched the strings ;

And, after prelude of unearthly sound,

Poured through the echoing hills around,

He sung—

“ No wintery desolations,

Scorching blight, or noxious dew,

Affect my native habitations ;

Buried in glory, far beyond the scope

Of man's inquiring gaze ; but to his hope

Imaged, though faintly in the hue

Profound of night's ethereal blue ;

And, in the aspect of each radiant orb,

Some fixed, some wandering, with no timid curb ;

But wandering star and fixed, to mortal eye,

Blended in absolute serenity,

And free from semblance of decline,

Fresh as if evening brought their natal hour,

Her darkness splendour gave, her silence power,

To testify of love and grace divine.

III.

“ What if those bright fires

Shine subject to decay ;

Sons, haply, of extinguished sires,

Themselves to lose their light, or pass away

Like clouds before the wind,

Be thanks poured out to Him whose hand bestows,

Nightly, on human kind

That image of endurance and repose.”

— And though to every draught of vital breath,

Renewed throughout the bounds of earth or ocean,

The melancholy gates of Death

Respond with sympathetic motion ;

Through all that feeds on nether air,

How'er magnificent or fair,

Grows but to perish, and intrust

Its ruins to their kindred dust ;

Yet, by the Almighty's ever during care,

Her procreant vigils Nature keeps

Amid the unfathomable deeps ;

And saves the peopled fields of earth

From dread of emptiness or dearth.

Thus, in their stations, lifting tow'rd the sky,

The foliaged head in cloud-like majesty,

The shadow-creating race of trees survived :

Thus, in the train of Spring, arrive

Sweet flowers ;—what living eye hath viewed

Their myriads ?—endlessly renewed,

Whenever strikes the sun's glad ray,

Where'er the subtle waters stray ;

Wherever sportive zephyrs bend

Their course, or genial showers descend !

Mortals, rejoice ! the very angels quit

Their mansions, unsuspicious of change,

Amid your pleasant bowers to sit,

And through your sweet vicissitudes to range.

There is not a finer ode than this in the English language ; by whatever name it may be called,—hymn, anthem, or poem, it is a most beautiful composition. Yet here is another, gentle reader, equally rich in all delightful images of thought and feeling.

DEVOTIONAL INCITEMENTS.

“ Not to the earth confined,
Ascend to heaven.”

WHERE will they stop, those breathing powers,

The spirits of the new-born flowers ?

They wander with the breeze, they wind

Where'er the streams a passage find ;

Up from their native ground they rise

In mute aerial harmonies ;

From humble violet—modest thyme—

Exhaled, the essential odours climb,

As if no space below the sky

Their subtle flight could satisfy :

Heaven will not tax our thoughts with pride

If like ambition be *their* guide.

Roused by the kindest of May-showers,

The spirit-quickener of the flowers,

That with moist virtue softly cleaves

The buds, and freshens the young leaves ;

The birds pour forth their souls in notes

Of rapture, from a thousand throats—

Here checked by too impetuous haste,

While there the music runs to waste,

With bounty more and more enlarged,

Till the whole air is overcharged ;

Give ear, O man ! to their appeal,

And thirst for no inferior zeal,

Thou, who canst *think*, as well as feel.

Mount from the earth ; aspire ! aspire !

So pleads the town's cathedral choir,

In strains that, from their solemn height,

Sink, to attain a loftier flight ;

While incense from the altar breathes

Rich fragrance in embodied wreaths ;

Or, flung from swinging censer, shrouds

The taper-lights, and curls in clouds

Around angelic form, the still

Creation of the painter's skill,

That on the service wait concealed

One moment, and the next revealed.

— Cast off your bonds, awake, arise,

And for no transient ecstasies !

What else can mean the visual plea

Of still or moving imagery ;

The iterated summons, loud,

Not wasted on the attendant crowd ;

Nor wholly lost upon the throng

Hurrying the busy streets along.

Alas ! the sanctities combined

By art to unsensualise the mind,

Decay and languish ; or, as creeds

And humours change, are spurned like weeds :

The priests are from their altars thrust ;

Temples are levelled with the dust ;

And solemn rites and awful forms

Founder amidst fanatic storms.

Yet evermore, through years renewed

In undisturbed vicissitude

Of seasons, balancing their flight

On the swift wings of day and night,

Kind Nature keeps a heavenly door

Wide open for the scattered poor.

Where flower-breathed incense to the skies

Is wafted in mute harmonies ;

And ground fresh-cleaved by the plough
Is fragrant with a humbler vow :
Where birds and brooks from leafy dells
Chime forth unwearied canticles ;
And vapours magnify and spread
The glory of the sun's bright head—
Still constant in her worship, still
Conforming to the Eternal will ;
Whether men sow or reap the fields
Divine admonishment she yields,
That not by bread alone we live,
Or what a hand of flesh can give ;
That every day should leave some part
Free for the sabbath of the heart ;

So shall the seventh be truly blest,
From morn to eve, with hallowed rest.

Our present space will not permit us to extend the remarks which the perusal of these delightful poems have suggested to our minds. We shall reserve them for another paper, when we shall also offer a few remarks upon Wordsworth's "Theory of Poetic Diction," and on the subject of Imagination and Fancy, as connected with and allied to Poetry.

THE CHURCH OF ROME.

MR. RAE WILSON, who is known as the author of "Travels Through the Holy Land," in a recent work,—"Records of a Route through France and Italy, with Sketches of Romanism," which, as we understand, is a prohibited work in Italy, from maintaining the principles of *Protestantism* in opposition to *Papal* doctrines,—concludes in the following terms :—

"*Romanism* has so nailed itself down to its old and inveterate superstitions, as to render it utterly impossible to liberate itself from them, without abjuring the character it has wrought out of the elements of the Gospel, remoulding and transmuting them as has best suited its own views. Either the word of God is most obscure and defective, or the Roman Catholic church has most unwarrantably ingrafted upon it very gratuitous and extraneous doctrines. Neither are those doctrines regarded by it as of inferior moment, compared with the fundamental and more explicitly enounced truths of Christianity ; but full as much stress is laid upon the human invention of after ages as upon what incontestably belongs to our common religion as delivered to the world by its glorious Founder. So very far is Romanism from being consistent even with the spirit of the Gospel, in the numerous additions made to, and the complex system it has reared upon it, that it requires the utmost ingenuity, the most subtle interpretation on the part of its advocates, to make out even any tolerable show of consistency. They have recourse to obscure traditions, and all kinds of doubtful, not to say fraudulent, authorities for their purpose, instead of abiding by the very plain and express declarations of the Bible ; and while they thereby give a falsifying value to what can possess none except as it coincides with scriptural doctrines, they reduce the latter to the level of those inventions they thus seek to exalt.

"Neither does there seem to be the least disposition on the part of the Romish church to suffer its exceptionable tenets gradually to fall into desuetude or oblivion, and so work out a silent reform in its own bosom. What it *has* been, that it will *ever* continue to be, whenever and wherever it shall have the power of acting

uncontrolled by circumstances. Never has it abjured a single one of its mischievous errors spontaneously ; for to some of the most mischievous of all it still clings with a pertinacity hardly short of miraculous, after those powerful arguments that have been used against them. No : although the court of the Vatican is no longer what it formerly was, yet the spirit of papacy remains the same—scotched and wounded indeed, but not killed, nor even subjugated. Allow it but to recover itself and gain vantage ground, and its present seeming humility and moderation will be forthwith cast aside.

"However improbable it may appear that Romanism should ever regain that dominion it has lost—that any re-action should now take place in its favour, shaken, as it has been to its very foundations, it is nevertheless possible ; since, although it must find opposition from the increased intelligence of the present age, it is also likely to find no ineffective auxiliaries in the weaknesses and passions of mankind. Being altogether unlike that blessed religion of the Gospel, of purely Divine origin, it scruples not to effect its purposes by carnal weapons, and if most despotic, it can also stoop in order to become so. For the austere, it is most profuse of austerities, and to them it offers the most rigid ascetism. To the worldly and sensual, again, it holds out the most seductive bribes, promising them the fullest indulgence of their appetites in a present world, with full assurance of blessedness in the next, and that upon the easiest terms imaginable. The church which substitutes penance for repentance, and insists upon the efficacy of vicarious prayers and purchased righteousness, is wise in worldly wisdom, and knows well how to profit by the sinfulness of human nature.

"As a system of Church policy, Romanism may command admiration. In outward attractions it is most imposing and captivating ; it has been the patron of art, its munificence has been unquestionable, its charities have been large and expansive, its zeal almost without a parallel, its ambition magnificent, and enthusiasm elevated. But it has also been in its motives most worldly—in its means most corrupt. When, therefore,

we dispassionately examine and bring it to the test of actual comparison, we are fully justified in boldly proclaiming that its doctrines are not

the doctrines of the glorious Gospel—its religion is not the religion of Him who shed his precious blood on the cross of Calvary!"

SITTINGS FOR MY PORTRAIT.

SIXTH SITTING.

THE conversation of the last sitting being resumed, I inquired respecting the meaning of the term "school," as applied to painting.

"It designates a class," said the artist, "who exhibit in their productions the manner of a particular master under whom they may have studied, or whose works are more or less imitated by them."

"May I then ask—but I see that I am diverting you from the business in hand."

"Not at all; for the first business in hand is to bring you into a conversible mood, so as to clear away the clouds from your countenance."

"But my object, my good friend, is to make you converse, that I may obtain information from you; but I will willingly postpone the subject to another time, if it interfere with your present occupation."

"Quite, I assure you, the reverse. I am enthusiast enough to be very fond of talking of my art, and though I dare not promise you all the information you may desire, it will equally answer my present purpose to speak or hear, so that your ordinary vivacity of countenance can be maintained, and the features be unconstrained."

"I was about, then, to inquire further respecting the principal schools of painting, since the revival of the art in Europe."

"The first that took the lead was the Italian *School of Florence*; in which the two most distinguished names are those of Leonardo da Vinci and Michel Angelo. The former devoted himself to express the affections of the soul, and in this he surpassed all his predecessors; but the latter far excelled him in boldness of conception and the knowledge of design. He cared little for graceful attitudes or indications of tender sensibility; his pleasure was to represent vehement passions, and to strike by the great and the terrible. 'If any man,' says Sir Joshua Reynolds, 'had a right to look down upon the lower accomplishments as beneath his attention, it was Michel Angelo;' nor can it be thought strange that such a mind should have slighted, or have been withheld from paying due attention to all those graces and embellishments of art which have diffused such lustre over the works of other painters."

"But I have always understood that it was Raffaele who surpassed so much in this department."

"True; but he belongs to the next school which I have to introduce, the *School of Rome*. Of this, Raffaele was the founder. At first, he

imitated Pietro Perugino, under whom he studied, but the sight of the performances of the great masters just named awakened his genius, and converse with some of the chief productions of antiquity gave it a sublime direction. He was always, however, a close imitator of nature, and seldom attempted to represent ideal figures. He was fond of what are termed 'masses' of light, by which his figures are very distinct at a distance; but his chief excellence lay in the *composition* of his pictures, in which he took care not only to be expressive, but to avoid diverting the attention from the principal object by his accessory figures. His peculiarities are found in the propriety, beauty, and majesty of his characters. He could paint philosophers and apostles.

"In another School, called the *Venetian*, we have copies of the forms of nature, and the beauty discernible in the mixture and variety of natural colours. Dominic was the second Italian artist who painted in oil. He educated Bellin, who taught his two sons, Gentil and Giorgion; with whom was afterwards associated Titian. This eminent man was taught to imitate nature in the most servile manner; but while he was induced to study the ideal in colouring by Giorgion, he soon excelled him. He was both a portrait and landscape painter. His colouring is exquisitely fine; and he is one of those historical painters who have succeeded also in landscape.

"The founder and chief ornament of the *Lombard School*, which is distinguished for its design, colouring, and mellowness of pencil, is Correggio. He was devoted to the graceful; and though an accurate imitator of nature, avoided acute angles, straight lines, and short turnings. His lights are too clear, but the character of his shade is peculiar and admirable; this he produced by a certain manner of glazing them. He excelled both in harmony and grace, being a perfect master of the art of uniting light to light, and shade to shade. A second Lombard school was formed by the Caracci, Lewis, Augustin, and Hannibal. The three latter often painted the same piece, and established an Academy at Bologna. Hannibal is esteemed a model for beauty and design. Sir Joshua Reynolds describes Lewis as the best model for *style*, that is, the faculty of disposing colours so as to express our sentiments and ideas.

The *French School* unites the different parts of the art, the Florentine, Lombard, Venetian, and Roman manner, without any great pretensions to surpassing excellence. Blanchard,

called the French Titian, and Poussin the French Raffaele, were distinguished as individuals; but formed no school. The productions of Poussin possess more of the air of antique painting than any other artist. His favourite subjects were ancient fables. Vouet, his declared enemy, founded the French school. He had some grandeur and wonderful facility of execution. Le Brun was his pupil, and very soon astonished his master by his progress. He had a fine conception and fertile fancy, but chiefly excelled in exact likenesses, and in costume. He delighted in allegorical painting. Eustace le Sueur was his contemporary and rival, and, had he lived longer, would probably have infused a better taste into the French school. The Count de Ceyles and M. Vien laid the foundation, however, of great improvements: but the political convulsions of France and of Europe have not much benefited their national art."

"Has not David been much celebrated?"

"Yes; but they want a Bonaparte to conquer bad taste as well as bad government."

"You have not referred to the Germans."

"In truth there is no German school, properly so called; as they are known only for their single artists, particularly Albert Durer and John Holbein. The former was an engraver as well as a painter. He had a brilliant genius, and his works are finished with great exactness; but he is stiff, and had little taste or grandeur in his expression.

"The first practice, if not the discovery of the art of oil painting, is attributable to the *Flemish School*. The celebrity of the invention, however, has been divided between John Van Eyck and the English artists, who are said to have known it long before his time. Peter Paul Rubens was the founder of the school in question; a man almost as remarkable for the numbers as for the excellence of his productions. His facility seems to have been equally great, both in inventing and executing, and he often produced a number of different sketches of the same subject. He too frequently, indeed, sacrificed correctness of design and beauty of form to colouring and splendour. He is, however, surpassed by Titian in colouring, but unrivalled in grandeur and effect. He appears pre-eminent in every department; in historical, landscape, portrait, animal, and flower painting. His school,

accordingly, is remarkable alike for the vastness of their conceptions and the brilliancy of their colours. Their figures have all a strong and natural expression.

"The *Dutch School* is inimitable in the representation of particular scenes, and in exact imitations of low life. The colours are powerful, and the method of throwing the most vivid light upon one spot is carried to great perfection. The perspective of the Dutch painters is accurate; and they greatly excel in miniature painting. Of this latter branch of the art, Cornelius Polembourg was the head and chief promoter. Rembrandt Vanhryn, however, is the most distinguished of all the painters; but his subjects are characteristically vulgar. He is fond of strong oppositions of light and shade, and sometimes loaded his pictures with immense quantities of colour. His faults are great, but his works have much expression.

"The *English School* was founded by Sir Joshua Reynolds. His example, and his precepts, in the discourses delivered to the Academicians, have formed for him a wreath of immortal fame. His followers have distinguished themselves for the art of managing a multitude of figures, as well as for greatness of style and boldness of expression. The success of the English school has not been, however, very brilliant, though individual painters have attained to the highest eminence: particularly in the line of portrait painting, the productions of the late Sir Thomas Lawrence are invaluable and immortal.

"Sir Joshua Reynolds considered the Roman, Florentine, and the Bolognese, as the three great schools in the epic style, whilst the best French painters were a kind of colony from the three; but the Venetian, Flemish, and Dutch schools he ranked as inferior, because they aimed only at the ornamental and elegant. He remarks, that 'works of genius and of science, if founded upon the general truths of nature, will live for ever, while those which depend upon the localities of time and place, or partial views of nature, and on the fluctuations of fashion, must inevitably fade away with those circumstances which have raised them from obscurity.' Present time and future must be considered as rivals, and he who solicits the one must expect to be discountenanced by the other."

LIVINGSTON'S SYSTEM OF PENAL LAW IN THE STATE OF LOUISIANA.

CHAPTER III.

This forms the third portion of Mr. Livingston's admirable "System of penal Law." Compare with this the law of evidence as laid down in our own courts.

III. The "Code of Evidence" begins, as do those that precede it, by an introductory title,

laying down rules and making explanations, to avoid circumlocution, and to give the perspicuity necessary to a full understanding of the subsequent provisions. Among these are two articles intended to secure the advantages to be derived from the wisdom of the judges in the suggestion

of defects proved by experience, without incurring the fault into which the same intention has repeatedly led, of transferring to the judiciary powers exclusively legislative. The first of these articles directs the court to make a report to the legislature whenever any provision of the code for the admission or exclusion of evidence is found to operate improperly, either to the prejudice of the accused, or to the ends of public justice. By these means, instead of judicial decisions of doubtful authority, interspersed through voluminous reports, a positive law, briefly expressed, may be introduced regularly into the code by the legislative power. The other article provides a similar remedy for omissions, instead of leaving them to be supplied by the discretion of the courts. These provisions, novel in themselves, establish principles highly important to be introduced into every written code; they counteract the most forcible objection that can be made to the system, without calling in the inappropriate exercise of legislative discretion by the judiciary; they offer the greatest facility for discovering imperfections, and bringing them to the notice of the legislature; and they check at once the injurious operation of any rule discovered by experience to be bad.

The two books into which this code is divided embrace, first, the nature and kinds of evidence; secondly, the rules to be applied when the different kinds are offered in proof.

In the first book, evidence is defined to be that which brings, or contributes to bring, the mind to a just conviction of the truth or falsehood of the fact asserted or denied. When applied to the determination of litigated rights, it is necessarily restricted to what is declared by the written law sufficient to produce that just conviction, in a greater or less degree. This necessarily divides evidence into two great classes—that which the power called on to judge has from its own knowledge, and that which it derives from extrinsic sources. The first class has no subdivision. The second is, of course, of various degrees, whether considered in regard to its source or its weight. Its source may be personal communication, written instruments, or natural objects, making it testimonial, scriptory, or substantive. Its weight ascends from mere induction to complete proof, and is presumptive, direct, or conclusive.

In prescribing the rules applicable to these several kinds of evidence, which is the object of the second book of the code, that embraced in the first subdivision, as derived from the knowledge of the judge himself, is properly confined within very narrow limits. He can never act merely on his own knowledge of a fact, except where expressly authorized to do so. Instances of this authority are found in his power to pronounce on the authenticity of a record, to commit for an offence in his presence, to remove for a

disturbance in court, and to employ the military in aid of the civil power. But where he knows a material fact not thus designated, he must be examined as any other witness; and if a juror is similarly situated, his testimony must be given to his fellows in the same judicial manner.

In establishing the rules of extraneous evidence, Mr. Livingston has introduced some new principles in regard to such as is testimonial, or derived from personal communication.

"The whole machinery of jurisprudence," he remarks, "in all its branches, is contrived for the purpose of enabling the judging power to determine on the truth or falsehood of every litigated proposition. This is to be done by hearing and examining evidence; that is to say, hearing and examining every thing that will contribute to bring the mind to the determination required. If we refuse to hear what will, in any degree, produce this effect, we must determine on imperfect evidence; and in proportion to the importance of the matter thus refused to be heard, must evidently be the chance of making an incorrect, rather than a just determination. But as in morals we are forbidden to do evil that good may come of it, so in legislation we should refrain from doing that kind of good which may produce more than its equivalent in evil. The desirable end to be attained by the admission of every species of evidence may be more than counterbalanced, in some instances, by the evil attending it: sometimes in the shape of inconvenience and expense inseparable from its procurement; sometimes from the danger of error arising from the deceptive nature of the evidence itself. The great art is to weigh these difficulties; and, in those cases where they are most likely to preponderate, but in no others, to exclude the evidence."

The circumstances which are generally understood to cause exclusion are interest, connexion in marriage, infamy, the relation of an attorney to his client, that of a catholic to his confessor, and disbelief in a future state of rewards and punishments. In the remarks on the code of procedure, the extent to which a criminal may be allowed to testify in his own case has been noticed; the basis of his admission and exclusion being simply the consideration of what is most likely to be effective in establishing his innocence or guilt. This consideration is applied in this code to the evidence of one who, although not a party, may have an interest in the result of the judicial proceeding—an eventual gain or loss that may be estimated by money; and it has led to the abolition of such disqualification, although the fact of interest in the witness is to be fully made known, that it may lessen, according to its degree, the credit to be given him. To exclude entirely an interested witness involves the double assumption that his interest will outweigh his conscience and fears of detection and punish-

ment, and that the judge or jury will believe the falsehood he asserts, although his interest is known. These assumptions are founded neither in probability nor reason, and, on that account alone, would authorise the rejection of the antiquated rule. But even if they were well founded, it would be certainly unwise, merely on account of them, to exclude the testimony of interested witnesses from whom the truth may fairly be expected. The only sound rule is the obvious one. The judges of the facts are the true judges of the credit of the witness, they know his interest and his bias; let them hear him; let them say whether his interest is such as to destroy his credit; let them form, with full knowledge of the particular case, that opinion which the positive rule of exclusion obliged legislators to form in advance, and entirely without such knowledge.

If the search for truth does not require that an interested person, nor even a party himself, should be excluded from giving testimony, neither does it make connexion in marriage a cause for rejecting a witness. If it be admitted, as it will be, that every one has a right to all the information necessary to the discovery of truth, unless deprived of it for reasons of great public or private convenience, then it must be proved that such inconvenience arises from a husband or wife being examined in regard to each other. To establish this is manifestly impossible; to say that there is danger of domestic dissension or of perjury, is to give a reason not more strong than might be offered for the exclusion of vast numbers of witnesses; while, on the other hand, such testimony often is undoubtedly the best which an accused person can offer in his own behalf. The feelings produced by such a tie are known to those to whom the evidence is submitted; they will be weighed in the credit which it receives; to say they are sufficient to close peremptorily such an avenue for truth is indeed strangely to distrust the intelligence and honesty of the judge.

Mr. Livingston considers that in the relations of attorney and client, and catholic and confessor, there are reasons sufficient to justify the exclusion of their testimony in regard to facts communicated or discovered by means of those relations. The circumstances under which the knowledge is obtained would make the disclosure an invasion of the rights of personal liberty and conscience. The law, besides, would be useless if it could be executed, because in that case, as it would destroy both confidence and confession, nothing would be disclosed.

Exclusion on the ground of infamy is not admitted in the code. Such a disqualification is less reasonable than that of interest: there, a motive may exist for stating a falsehood in preference to the truth; here, there is no such motive; the only reason is the depravity of the

witness. This may affect his credit; but to deprive a person accused of the entire benefit of his testimony when sufficient or necessary for an acquittal, to permit a heinous offence to pass unpunished when the facts are known only to him, are perversions of every principle that ought to regulate the admission of evidence.

The doctrine which makes a witness's belief in a future state of rewards and punishments, Mr. Livingston considers as improperly making the fidelity of statement to depend solely on religious belief. While he owns that such a belief is an additional motive and guarantee for the truth of a witness, he maintains that there are reproaches of conscience in this life, a moral sense disclosing the utility and beauty of truth, sentiments of manly honour, a disdain of falsehood, a dread of society, a fear of punishment, which are also motives, and strong motives; and that, although they might, and undoubtedly would be strengthened by the impressions of religion, they are yet in themselves sufficient to justify us in believing that they alone would induce a witness to prefer truth to falsehood. The want of that additional inducement might lessen the credit of a witness among the pious and good; but he conceives that it would not, of itself, among the thinking or the charitable, produce a total disbelief of all he might declare.

Allowing, therefore, no exceptions to the admission of testimonial evidence, except the two we have mentioned, together with insanity and immature infancy, the code proceeds to regulate the manner in which it is to be received. Here a boundless field of debatable ground is presented by a provision that, with the exception of such as suggest facts to the witness, all interrogatories pertinent to the case may be put, and must be answered; and a short section declares that, in written examinations, the rules for receiving oral declarations shall be followed.

Scriptory evidence, which includes all kinds of written proof except the examination of witnesses reduced to writing, is of two kinds—authenticated and unauthenticated. The former consists of public instruments duly attested in a prescribed form, such as legislative acts, those of public officers in executing their official duties, and records of courts or of government; the latter consists of private instruments, either attested by the signature of the party whose act it purports to be, or not attested, from accident or from its natural character.

Substantive evidence is so simple and limited in its nature, that it is only necessary to prescribe such rules as require additional proof to show its application to the principal case. Thus, a bloody dagger is substantive and striking evidence; but it fails of its weight unless it be proved that it was in the hand of the accused before or after the time a homicide was perpetrated.

From considering evidence in relation to its source, the code proceeds to ascertain the degree of weight it is entitled to when presumptive, direct, or conclusive. It may be objected, that the conviction of truth being an intellectual operation, the degree to which evidence is to operate cannot be prescribed; and that this division, however convenient in developing the nature and theory of evidence, is not necessary in fixing rules for its admission. It must be allowed, however, that uniformity in judicial decisions is a highly desirable object; and that, in similar circumstances, the same deductions ought to be made from the same facts. This can only be done by requiring the judicial decree to be rendered in conformity with the established rule, whenever the evidence considered by it to be sufficient is produced. To establish that rule by positive legal provisions, is, therefore, infinitely better than leaving it to usage or precedent.

Presumptive evidence may result from circumstances proved by the mere operation of the mind, or be drawn from them by express direction of law. Its effect, whether simple or legal, is to establish a proposition, until the contrary is directly shown, or it is rendered doubtful by other presumptions. The circumstances from which it arises must be proved by legal testimony, and the deductions must be such as are warranted by the usual propensities of mankind,

the habits or passions of the individual, or the ordinary course of business and human events.

Direct evidence, if true, indisputably establishes a proposition. The declaration of a witness that he saw the act in controversy done, is direct evidence; for if the declaration be true, nothing more is necessary to establish the commission of the criminal act; no deduction need be made from the fact that is proved, as in the case of presumptive evidence.

Conclusive evidence proceeds a step farther: it is that which the law declares to be absolutely sufficient, without requiring the judge to draw any inference from the fact, and the reality of the fact alleged is undoubted. The confession of the accused is not admitted to be conclusive, because its truth is not of necessity undoubted; insanity, promises, fear, hope of liberty or pardon, may produce a confession contrary to fact, and therefore, although it is direct evidence, it becomes not conclusive till its truth is absolutely established. Proof that an absentee was born one hundred years before, is only presumptive evidence of his death, because, though it be the general course of nature for men to die before that age, yet it is not invariable; but proof that he was born two hundred years ago is conclusive evidence, because no instance has been known of human life extended beyond that period.

GEMS.

OCCUPATION OF TIME.—If we look into the behaviour of many whom we daily converse with, we shall find that most of their hours are taken up in these three important articles of eating, drinking, and sleeping. I do not suppose that a man loses his time who is not engaged in public affairs, or in an illustrious course of action. On the contrary, I believe our hours may very often be more profitably laid out in such transactions as make no figure in the world, than in such as are apt to draw upon them the attention of mankind. One may become wiser and better, by several methods of employing one's self in secrecy and silence, and do what is laudable, without noise or ostentation. I would, however, recommend to every one of my readers, the keeping a journal of their lives for one week, and setting down punctually their whole series of employments during that space of time. This kind of self-examination would give them a true state of themselves, and incline them to consider seriously what they are about. One day would rectify the omissions of another, and make a man weigh all those different actions, which, though they are easily forgotten, must certainly be accounted for.—*Addison*.

CHRISTIANITY.—Of every other system, it may be said, that it only activates a part of our nature, leaving the rest like a palsied member of the body, unnoticed and nauseated; to Christianity alone belongs the high prerogative of calling every latent principle of our complex nature into action, giving appropriate exercise to every function, and proportion to every part; of animating, and maturing, and circulating, like an ethereal fluid, through the whole, and bringing it to the perfection of "a man in Christ Jesus." Wherever it comes it creates a capacity for true enjoyment, and puts all

the universe in motion to gratify that capacity. It makes us feel that we exist under an obligation to be happy. Perfect itself, it pants to behold perfection in every thing else; and since it finds it not already existing, it puts forth all its efforts to produce it. Perfect from the beginning, it has remained unchanged, while the arts and sciences, and systems of a dateless antiquity, have yielded to the demand for improvement. It has seen every thing human, contemporaneous with its origin, renovated and changed again; but like the Jewish legislator, when he had survived his generation, its eye is not dim, nor its natural force abated. It maintains its post in the van of improvement, and points the way to enterprise and hope, as the anointed leader of mankind. And however untrodden the paths, and high the distinctions which await them in their onward course, it will still be seen in exemplary advance, beckoning them on to the goal of perfection. No living springs of good shall gush from their hidden depths in human nature, which have not been smitten into existence by this rod of heaven; no forms of excellence shall arise to bless the world, of which it is not the parent and the perfect type. Only give the Gospel room to plant its moral apparatus, and let it obtain the necessary fulcrum for its powers, and it will employ a lever which shall move the world from the dark vicinity of hell, and lift it into the sunlight and neighbourhood of heaven.—*Harris*.

WISDOM.—The only wisdom which shall survive the grave is that which cometh down from heaven, and is to be found in the pages of revelation; and all who, neglecting that, are not wise towards God, are still children, under all the elements of the world. He who, with all his knowledge, does not know himself,

his own heart, and his own spiritual condition as a sinner before God; and he who, ignorant of the love of God in Christ Jesus, has not repented, not believed the Gospel, is, after all, only a child, and occupied

about childish things; things which will be as useless in eternity as the toys of infancy are now in manhood.

—Close.

LIFE AND MANNERS.

VOLNEY'S "RUINS OF EMPIRES."—"Conversing one day," says Mr. Maxwell, "with an eminent scholar, I mentioned Volney's 'Ruins of Empires,' and he replied, that he had visited the author of that book while in Paris. He took him into his library. He looked round, put his hand upon several books, and said, 'Here, Mr. Volney, are the sources of your novel opinions.' He acknowledged to the doctor that he was right, and said, 'I am not anxious about it.' 'Have you seen the reply of Dr. Priestley, and, more particularly, that of an English clergyman?' He said 'No,' and then spoke to this effect:—'I have no interest in defending the book; I do not pledge myself for the sentiments it contains. I was compelled to write, by the desire of Bonaparte. I was ordered to manufacture a revolutionary book upon the subject of religion. I consider myself as a private in the ranks, obeying the commands of his superior officer.' Such is the origin of a book full of astronomical fable, a book which may injure persons of light and superficial reading, but can make little or no impression upon the minds of those who have been rightly instructed, for it fails miserably in the only point of consequence. It does not bring a shadow of evidence to prove the superior antiquity of the false over the true religion, and leaves us at full liberty to suppose that the heathens begged, borrowed, or stole all their religious knowledge from the Bible, taking care to spoil it by inventions of their own. On the whole, it affords a fine commentary on Romans i. 20-25."

SCENE ON BOARD A MAN-OF-WAR.—Whilst on board this frigate, on my voyage from Africa to the West Indies, I had an opportunity of witnessing the discipline of the navy, as carried into effect by the commodore, who was a religious man. He himself performed the office of chaplain every Sabbath-day, by reading the prayers on deck, with the whole ship's company. Certain days in the week were assigned by him for the punishment of offences, which, although committed on preceding days, were kept in score against the day of quittance. The mariners being armed on the poop, and all hands on deck, an officer reported that every thing was ready. The commodore retired to his closet to pray; on his return he fixed a pair of pistols under his sword-belt, and proceeded to the scene of action. The name of the culprit being called, he came forward, and was charged with having done thus and thus, at such a time. The man would sometimes enter into explanation; and verbal evidence was admitted for and against him. The evidence rarely lasted more than three minutes, often less; after which came the authoritative order, "Take off your shirt, sir!" The poor fellow was assisted in this by the boatswain's mate, who lashed him to the gratings, which were tied in an upright position against the gangway; and then, with a muscular arm and heavy cat, administered as many lashes as were thought by the commodore sufficient for his brother who had been "overtaken in a fault." I had, however, yet to learn that a Christian, in full possession of the light of the Gospel, could, not without being thereby reprehended, expose himself to this gross inconsistency—following, for expediency, the usages of his profession.—*Pilking-ton's Narrative.*

PRIVATE SECRETARIES OF MINISTERS.—During the reign of Napoleon the private secretaries of all his ministers dined together on the first of every month, at the Restaurateur Beauvilliers. At these dinners the secretaries made known to each other the places that were vacant, the competitors who solicited them, and the new establishments that were to take place; and they made the necessary arrangements for securing the vacant posts for their favourites. It is recorded that a gentleman of ancient family, who had presented a petition bearing the signature of a princess, and who was greatly astonished at receiving no answer, determined to have the mystery cleared up at the next secretaries' dinner. The company were attended, during their private banquet, by one of Beauvilliers's most dexterous waiters. The gentleman who had solicited the vacant place, having bribed the waiter by a double louis-d'or, put on his jacket and apron, and in his disguise attended on the dispensers of ministerial favours. The conversation happened to turn on their private affairs; and one of the company said, "I lately played an excellent trick upon a gentleman of ancient family, who was soliciting a vacant place. His request was backed by the signature of a princess; a recommendation which, of course, he deemed infallible. But I slipped the petition into the drawer of my desk, and obtained the place for myself. How disappointed the poor fellow will be! Waiter, fill me a glass of champagne, and I'll drink the fool's health." The man of ancient family, highly mortified obeyed the command; but when the dinner was ended, he changed his dress, called on the minister, and renewed his demand. The minister assured him that he had heard nothing of the affair; but the applicant asserted that he knew where the petition was, and described the drawer in the secretary's desk. The petition was accordingly found, and the solicitor obtained the place, to the great astonishment of the secretary.

HUSBANDS AND WIVES.—When people understand that they must live together, they learn to soften, by mutual accommodation, the yoke which they know they cannot shake off. They become good husbands and good wives, from the necessity of remaining husbands and wives; for necessity is a powerful master in teaching the duty which it imposes. If it were once understood that, upon mutual disgust, married persons might be legally separated, many couples who now pass through the world with mutual comfort, with attention to their common offspring, and to the moral order of civil society, might have been at this moment living in a state of mutual unkindness, in a state of estrangement from their common offspring, and in a state of unreserved immorality. To be sure, if people come together in marriage with the extravagant expectations that all are to be halcyon days—the husband conceiving that all is to be authority with him, and the wife that all is to be accommodation to her, every body sees how that must end; but if they come together with a prospect of happiness, they must come with the reflection that, not bringing perfection in themselves, they have no right to expect it on the other side; that, having respectively many infirmities of their own to be overlooked, they must overlook the infirmities of each other.—*Lord Stowell.*

MISSIONARY THOUGHTS.

"God be merciful to us, and bless us, and cause his face to shine upon us: that thy way may be known upon earth, and thy saving health among all nations."

Taux piety lies at the foundation of all Christian usefulness, and the blessing of God is essential to success.

But wherever genuine piety exists, a concern will be felt for the salvation of others. This is the secret of all the religious activity and benevolent efforts of the present day. The men who are the mainspring of all this activity are not of the infidel class,—when did infidelity ever bless a family, or tranquillise a community, or lay itself out for the good of man? They are not of the worldly class,—they have no ear, no heart, no taste for any thing which does not relate to their worldly interest. Nor are they the irreligious of any class. But they are those who have imbibed a portion of the mind that was in Christ; of him who came from heaven to earth, and laid open all the resources of his nature for the happiness of man; they believe that it would not profit a man to gain the whole world if he lost his own soul—that he who converteth a sinner from the error of his ways, saveth a soul from death, and hideth a multitude of sins—that they have in their possession the only remedy for a perishing world,—and believing this, they call upon each other, and combine, and labour, and pray, and send forth their honoured agents to the ends of the earth, to make known the way to happiness and to God.

Christian benevolence feels for the world. He who is actuated by it confines not his regard to himself, nor to the particular church or denomination to which he more especially belongs. The godlike spirit of the Gospel throws open the enclosure of the most selfish heart; breaks down the barriers of prejudice; turns indifference for the souls of men into tender concern; and a spirit of hard-hearted monopoly, which cares only for its own little party, into a spirit of open-handed and open-hearted philanthropy, which opens its arms to the world, and for which the world is not sufficiently large.

Nor does it leave us in doubt as to the means we should employ for the happiness of the world. The remedy which has healed our own souls is the remedy for all mankind. It has been efficaciously administered to us, expressly that we may be able to speak confidently of its virtues to others. When the psalmist designed the welfare of men, he proposed not to send them the world's philosophy, nor did he pray for the diffusion of wealth—this may be done without the slightest alleviation of human misery;—he prayed that the saving health of God might be known among all nations—that the healing influence of salvation might sweep over the spiritual

sickness of the world, like a heavenly current of vital air, imparting life, and health, and universal happiness.

Did we consult only the *temporal* welfare of men, the wisest and most effectual method of promoting even that would be to send them the Gospel. Nothing lifts them out of a state of barbarism into a state of civilization and comfort so speedily and so effectually as *that*. It gives them a Sabbath, and institutes marriage, and throws a shield over their property, and blesses them with liberty, and puts them under the protection of government and law; and thus it lays a foundation for all civil improvement and social happiness. But if we design to promote their *spiritual* welfare, the Gospel is the *only* means. Here, there is no competition, no rival, no question—the Gospel is the only remedy for a perishing world. Compared with its wisdom, every other system is foolishness—for it is the wisdom of God. Compared with its power to sway the heart, all other strength is weakness—for it is the power of God unto salvation to every one that believeth. Compared with its truth and purity, its majesty and grace, Mohammedanism is an imposture and a pollution, modern Judaism a childish ceremony and a fable, Paganism a falsehood and a debasement, Deism an unsubstantial shadow, and Atheism a darkness and a horror. "Lord, to whom shall we go but unto thee, for thou hast the words of eternal life?" Yes, "this is life eternal, to know thee the only true God, and Jesus Christ whom thou hast sent." This alone can ease the conscience burdened with guilt, cleanse the heart defiled with sin, wipe the tear from the eye of the mourner, and sanctify and conduct the soul to the felicities of heaven. But the Gospel *can* do this; for it reveals an Almighty Saviour, and a sanctifying Spirit, and a God of all grace, and an eternal world of blessedness and life.

Wherever the Gospel has been carried, it has triumphed. The church of God is represented, in prophecy, as taking her stand on some lofty eminence, and inquiring, as she surveys the myriads which come flocking to her bosom, "Who are these that fly as a cloud, and as doves to their windows?" Could we take our stand on a similar elevation, and look down on the wide field of missionary labour, we should behold abundant reason for uttering, like her, expressions of exultation and surprise. Turn in whatever direction we might, we should witness the triumphs of Christian enterprise. Each of our great religious institutions can boast its own peculiar successes. Ask the British and Foreign Bible Society of its operations—and it will show you the people of a hundred and thirty languages reading in their own tongues the wonderful

works of God. Ask the Church Missionary Society—and it will point you to the reclaimed cannibals of New Zealand. Ask the Wesleyan Missionary Society—and it will direct you to its churches of converted negroes in the west. Ask the Baptist Missionary Society—and it will refer you to its triumphs both in the east and the west. Ask the London Missionary Society—and it will point you, among the many scenes of its Divine success, to the South Sea Islands. But where has the Gospel *not* triumphed? According to our efforts, has been our success. In proportion as we have laboured for God, in dependence on his blessing, he has blessed us. Had we laboured more abundantly, more abundantly would he have blessed us.

But distinguished as our success has already been, we are encouraged to look for yet "greater things than these." Glorious things are spoken of Messiah's reign. The very ends of the earth shall fear him. "The veil shall fall from the face of the Jews, and they shall look upon him whom they have pierced, and mourn. The hateful corruptions of the Romish system shall be cast off, and shall leave nothing but the pure form of its earliest church. The faith and worship of the Greek shall be purified. The fables of Bramah shall be forgotten in the knowledge of the One True God. The incarnations of Boodha shall give place to the glorious assurance of a higher incarnation. The grand Lama shall die, and be replaced by Him who only hath immortality. The mosques of the Impostor shall fall; and Christianity cleanse every temple of superstition. Then shall Ethiopia be seen stretching out her hands unto God: she shall arise and shake the ashes of misery from her sable locks, the slave-chain shall fall from her loins, and she shall exult in a double liberty. The painted tribes of Columbia—the aborigines of America, stately and thoughtful men—shall know who indeed is the Great Spirit, and shall find that in him they live, and move, and have their being. The race of Ishmael, traversing the desert tracts of Arabia; the castes of India, with their numbers infinite; the national Chinese; the Tartar hordes; the unknown and snow-concealed inhabitants of the north; the tribes of Europe, and all the islands of the sea—all, all shall pay homage to the Son of God, and earth keep jubilee a thousand years." "His name shall endure for ever: his name shall be continued as long as the sun: and men shall be blessed in him: all nations shall call him blessed."

These are prospects to quicken the activity and fire the zeal of all the sincere followers of Christ. The flame is kindled, and is daily extending. The protestants of France, of Holland, Prussia, Germany, Switzerland, Denmark—as well as the Christians of Britain and America—are all embarking in the evangelization of the

world. And shall we withhold any thing essential to its accomplishment? God withheld nothing; he so loved the world that he gave his only begotten Son. Christ withheld nothing; he gave *himself* for us; and now offers to us his Holy Spirit. The Spirit withholds nothing; he is in the church, waiting to be implored, ready to accompany our efforts, to convince the world of sin, and to be known universally as the Spirit of grace. Only let him hear his church sending up the earnest, believing, and united cry, "Come from the four winds, O breath, and breathe upon these slain that they may live," and this valley of death shall be turned into a region of life. All things *divine* are ready.

What then is wanting on our part? Is it pecuniary resources? Christians, in surrendering yourselves to God, did you make an exception in favour of your property? If you have consecrated yourselves to his service, your dedication includes also all you have. Then economize for Christ. Bring forth of your substance, and lay it on his altar, as a free-will offering for the salvation of a world which he hath died to redeem.

Is it suitable agents? And is it possible that the question of finding such can be involved in uncertainty? Shall the Lord of the British churches ask for servants, and yet ask in vain? Viewed as a test of our devotedness to his cause, the question is certainly a momentous one. Should the number found be deficient, will the Head of the church look on unmoved. Will not the angel who was deputed to curse Meroz, receive a similar commission against us? Will not the hand that traced on the palace-wall the doom of Belshazzar in lightning words, write against us, *Ye are weighed in the balances, and found wanting*? "Pray ye, therefore, the Lord of the harvest that he would send forth labourers into his harvest."

And is not the want of prayer our *chief* want? Did we possess this, would not every thing else follow? "The effectual fervent prayer of a righteous man availeth much,"—how much, the day of judgment alone can disclose. We are not yet alive to the efficacy of prayer; the church of Christ at large is not; for its full power has never yet been tried. But the day is hastening on when its efficacy shall be tried on a scale before unknown; and it shall then be found that to pray is to employ the mightiest instrument for the conversion and renovation of the world. With these impressions, we would pour forth our hearts in the prayer with which we commenced, "God be merciful to us, and bless us, and cause his face to shine upon us: that thy way may be known upon earth, and thy saving health among all nations."

THE YOUNG KING OF ROME.

WHAT a beautiful child was the young king of Rome! How lovely he appeared as he rode through the gardens of the Tuileries in his shell-shaped calèche, drawn by two young deer, which had been trained by Franconi, and which were given him by his aunt, the queen of Naples! He resembled one of those figures of Cupid which have been discovered in the ruins of Herculaneum. One day I had been visiting the young king: the emperor was also there, and he was playing with the child—as he played always with those he loved—that is to say, by tormenting him. The emperor had been riding, and he had in his hand a whip which attracted the child's notice. He held out his little hand, and when he seized the whip, burst into a fit of laughter, at the same time embracing his father.

"Is he not a fine boy, Madame Junot?" said the emperor; "you must confess that he is."

I could say so without flattery, for he was certainly a lovely boy.

As soon as the king of Rome was born, the event was announced, by telegraph, to all the principal towns in the empire. At four o'clock the same afternoon, the marks of rejoicing in the provinces equalled those in Paris. The emperor's couriers, pages, and officers were dispatched to the different foreign courts with intelligence of the happy event. The senate of Italy, and the municipal body of Rome and Milan, had immediate notice of it. The different fortresses received orders to fire salutes, the seaports were enlivened by the display of colours from the vessels, and every where the people voluntarily illuminated their houses. Those who regard these popular demonstrations as expressions of the secret sentiment of a people, might have remarked that in all the faubourgs, as well as in the lowest and poorest neighbourhoods in Paris, the houses were illuminated to the very uppermost story.

A fête was got up on the occasion by the watermen of the Seine, which was prolonged until a late hour of the night. Nothing of all this was ordered: it came spontaneously from the hearts of the people. That same people, who for thirty-five years previously had experienced so many emotions, had wept over so many reverses, and had rejoiced for so many victories, still showed, by their enthusiasm on this occasion, that they retained affections as warm and vivid as in the morning of their greatness.

The king of Rome was baptised on the very day of his birth. The ceremony was performed at nine in the evening, in the chapel of the Tuileries. The whole of the imperial family attended, and the emperor witnessed the ceremony with the deepest emotion. Napoleon proceeded to the chapel, followed by the members of the household, those of the empress, of Madame Mére, the princesses, his sisters, and the kings, his

brothers. He took his station under a canopy in the centre of the chapel. A socle of granite had been placed on a carpet of white velvet embroidered in gold bees, and on the socle stood a gold vase, destined for the baptismal font. When the emperor approached the font, bearing the king of Rome in his arms, the most profound silence prevailed. It was a religious silence, unaccompanied by the parade which might have been expected on such an occasion. This stillness formed a striking contrast with the joyous acclamations of the people outside.

Maria Louisa suffered a difficult and protracted accouchement. She was for some time in considerable danger. Baron Dubois went to acquaint the emperor with this circumstance. Napoleon was in a bath, which he had been ordered to take to calm the feverish excitement under which he was suffering. On hearing that the empress was in danger, he threw on his *robe-de-chambre*, and ran down stairs, exclaiming to Dubois—"Save the mother! think only of the mother!"

As soon as she was delivered, the emperor, who was himself indisposed, entered the chamber and ran to embrace her, without at first bestowing a single look upon his son, who, indeed, might have passed for dead. Nearly ten minutes elapsed before he evinced any signs of life. Every method to produce animation was resorted to. Warm napkins were wrapped around him, and his body was rubbed with the hand; a few drops of brandy were then blown into his mouth, and the royal infant at length uttered a feeble cry.

An immense multitude besieged the doors of the palace, to obtain intelligence of the infant and of the empress. The emperor, on learning this, directed that a chamberlain should be constantly in one of the rooms to publish the bulletins of the empress's health as soon as they were delivered by the physicians.

I have already mentioned the emperor's fondness for his son. He used to take the king of Rome in his arms and toss him up in the air: the child would then laugh till the tears stood in his eyes. Sometimes the emperor would take him before a looking-glass, and work his face into all sorts of grimaces; and if the child was frightened and shed tears, Napoleon would say,—"What, sire, do you cry? a king, and cry! shame! shame!"

The hours at which the young king was taken to the emperor were not precisely fixed, nor could they be; but his visits were most frequently at the time of *déjeuner*. On these occasions the emperor would give the child a little claret, or rather would dip his finger in the glass, and make him suck it. Sometimes he would daub the young prince's face with it. The child would laugh heartily at seeing his father as much a child as he was himself, and only loved him the

more for it. Children invariably love those who play with them.

I recollect that once when Napoleon had daubed the young king's face, the child was highly amused, and asked the emperor to do the same to "Mamma Quiou," for so he called his governess, Madame de Montesquiou.

The emperor's selection of that lady for his son's governess, was a proof of his excellent judgment. It was the best choice which could have been made. Madame de Montesquiou was young enough to render herself agreeable to a child, whilst she had sufficient maturity of years to fit her for the high duty which the confidence of her sovereign had appointed her to fulfil. She was noble in heart as well as in name; and she possessed what the world frequently bestows only on fortune and favour—the esteem of all. She was indeed universally beloved and respected.

Madame de Montesquiou had been brought up rather differently from the young ladies of her time. Extreme care had been taken with her education, and she was pious, without being bigoted. She never failed going to mass on Sundays, but she did so without parade; for her piety was as enlightened as it was sincere. Her reputation was free from the slightest blemish. She was perhaps a little cold towards those with whom she was but slightly acquainted; but those who condemn any one for haughtiness should consider whether it is not dignity alone which strikes us as a blemish. For my part, I ever found Madame de Montesquiou, whether as the wife of the grand chamberlain, or as the governess of the king of Rome, perfectly engaging, polite, and prepossessing. Every one respected her, and wished to be numbered among her friends.

The attentions she bestowed on the king of Rome, during the period of his father's misfortunes, would in itself be sufficient to inspire love and respect. Not only had she, from the hour of his birth, lavished on him all the cares of a mother, and a tender mother; but from the day when the unfortunate child was cut off from all his family, and deprived at once of his father and mother, Madame de Montesquiou devoted herself to him, for she alone was left to protect him. To accompany him, she deserted country, friends, and family.

Madame de Montesquiou was not liked by the empress, and the cause has never been satisfactorily ascertained. It has been said that the duchess of Montebello, Maria Louisa's favourite, was jealous of her. This I do not believe. The duchess of Montebello is a very amiable woman; she was beloved by the empress to a degree that would have precluded all jealousy of another; and, besides, the feeling of envy is not in accordance with her character. She is too amiable a woman to have engaged in any intrigue to estrange Maria Louisa from the governess of her son.

The fact, however, is as I have stated. Maria Louisa did not like Madame de Montesquiou, a woman whom she ought to have loved as a sister, or as a mother, for the care she bestowed on her son. It has been said, by way of compliment to Maria Louisa, that she never did any one an injury; yet she possessed an apathy of soul, from the influence of which the governess of her child was not exempt. And what sort of love did she show for her own child? I have seen Maria Louisa, when she was mounting or alighting from her horse, nod her plumed head to him, which never failed to set him crying; for he was frightened by the undulation of her feathers. At other times, when she did not go out, she would repair at four o'clock to his apartment. On these occasions she would take with her a piece of tapestry, at which she would sit down and make a show of working, looking now and then at the little king, and saying, as she nodded her head,—"*Bonjour, bonjour.*"

Perhaps after the lapse of a quarter of an hour the *august mother* would be informed that Isabey or Paer were in attendance in her apartments; the one to give her lessons in drawing, the other in music. It would have been as well had she remained longer every day with her child, to take a lesson in maternal feeling from the woman who so admirably supplied her place. But it would have been of little use,—feeling is not to be taught.

Every morning at nine o'clock the young king was taken to the empress. She would sometimes hold him on her lap, caress him, and then commit him to the care of the nurse. And how did she employ herself afterwards? She read the papers, the *blütter*, as they call them, in Germany. When the child grew peevish, because he was not amused as his father used to amuse him, and cried at finding himself surrounded by serious and formal faces, his mother ordered him out of the room.

When I arrived in Paris, on my return from Spain, the emperor and empress had just completed a tour in the north of France, in the departments of Calvados and la Manche. The christening of the king of Rome took place on their return from this journey. There have already been so many descriptions of this ceremony, that it would be superfluous to enter into a fresh detail of it. I will merely mention that the young prince received names which show that the alliances formed by sovereigns, the vows made at the baptismal font, the adoption by every religious formality and the ties of blood, are mere fallacies. He was christened Napoleon François Charles Joseph! these are the names of his godfathers; they stand upon the register of his baptism, and they also appear on the tomb which closed over him at the early age of twenty-one.

One day, at Trianon, when the young king was but a year old, the emperor was playing

with him on the grass-plot before the pavilion. He took off his sword, girded it on the young prince, and completed his military costume by placing his hat on his head. He then went himself to some distance, knelt upon the grass, and extended his hands to the child, who walked towards him, stumbling all the way, because of the sword getting between his legs, and the hat falling over his face. Perceiving this, the emperor ran to him with all the nimbleness of a young man, and caught him in his arms to prevent his falling.

One of the ushers of the chamber, with whom I was lately conversing, wept like a child at his recollections of the young prince. This man told me that the king of Rome one morning ran to the state apartments, and reached the door of the emperor's cabinet alone, for Madame de Montesquiou was unable to follow him. The child raised his beautiful face to the usher, and said,—“Open the door for me; I wish to see papa.”

“Sire,” replied the man, “I cannot let your majesty in.”

“Why not? I am the little king.”

“But your majesty is alone.”

The emperor had given orders that his son should not be allowed to enter his cabinet unless accompanied by his governess. This order was issued for the purpose of giving the young prince, whose disposition was somewhat inclined to waywardness, a high idea of his governess's authority. On receiving this denial from the usher, the prince's eyes became suffused with tears, but he said not a word. He waited till Madame de Montesquiou came up, which was in less than a minute afterwards. Then he seized her hand, and, looking proudly at the door, he said,—“Open the door. The little king desires it.”

The usher then opened the door of the cabinet, and announced “His majesty, the king of Rome.”

A great deal has been said of the young king's violent temper. It is true he was self-willed and was easily excited to passion; but this was one of the distinctive characteristics of his cousins; they almost all partook of a similar hastiness of temper.

I have known Achille Murat so overcome by violent passion as to be thrown into convulsions, and this when he was of the same age as the king of Rome. Madame de Montesquiou once corrected the young king for these fits of passion. On one occasion, when he was very violent, she had all the shutters closed, though it was broad daylight. The child, astonished to find the light of day excluded, and the candles lighted up, inquired of his governess why the shutters were closed.

“In order that no one may hear you, sire,” replied she. “The French would never have you for their king, if they knew you to be so naughty.”

“Have I,” said he, “cried very loud?”

“You have.”

Then he fell to weeping, but these were tears of repentance. He threw his little arms round his governess's neck.

“I will never do so again, Mamma Quiou,” said he, “forgive me.”

It happened one day that the king of Rome entered the emperor's cabinet, just as the council had finished their deliberations. He ran up to his father without taking notice of any one in the room. Napoleon, though happy to observe these marks of affection, so natural and coming so directly from the heart, stopped him and said—

“You have not made your bow, sire! Come, make your obedience to these gentlemen.”

The child turned, and bowing his head gently, kissed his little hand to the ministers. The emperor then raised him in his arms, and addressing them said—

“I hope, gentlemen, it will not be said that I neglect my son's education. I trust he is well drilled in his *civilité puérile et honnête*.

Those who had much familiar intercourse with Napoleon, knew that the phrase *civilité puérile et honnête*, was a favourite with him when he was in a good humour.

Young Napoleon was an amiable child, and he became more so as he advanced in age. I know many affecting stories of him, which indicate the goodness of his heart.

When he was at St. Cloud, he liked to be placed at the window in order that he might see the people passing by. One day he perceived at some distance a young woman apparently in great grief, holding by the hand a little boy about the young king's age. Both were habited in mourning. The child held in his hands a paper, which he raised towards the window at which young Napoleon stood.

“Why is he dressed in black?” inquired the young king of his governess.

“Because, no doubt, he has lost his father. Do you wish to know what he wants?”

The emperor had given orders that his son should always be accessible to those in misfortune, who wished to make any application to him by petition. The petitioners were immediately introduced, and they proved to be a young widow and her son. Her husband had died, about three months previously, of some wounds he had received in Spain, and his widow solicited a pension.

Madame de Montesquiou, thinking that this conformity of age between the little orphan and the young king might move the feelings of the latter, placed the petition in his hands. She was not deceived in her expectations. His heart was touched at the sight of the young petitioner. The emperor was then on a hunting party, and the petition could not be presented to him until next morning at breakfast. Young Napoleon passed the whole of the day in thoughtfulness,

and when the appointed hour arrived, he left his apartment to pay his respects to his father. He took care to present the petition apart from all the rest he carried, and this of his own accord.

"Here is a petition, papa," said he, "from a little boy. He is dressed all in black.* His papa has been killed in your service, and his mamma wants a pension, because she is poor, and has much to vex her."

"Ah! ah!" said the emperor taking his son in his arms, "you already grant pensions, do you? Diable! you have begun betimes. Come let us see who this protégé of yours is."

The widow had sufficient grounds for her claim,

but in all probability they would not have been attended to for a year or two had it not been for the king of Rome's intercession.

The brevet of the pension was made out that very day, and a year's arrears added to the order.

Who can have forgotten that day when the emperor took his son to a review in the Champ de Mars? How his features brightened with pleasure on hearing the joyous acclamations raised by his veteran bands.

"Was he frightened?" inquired the empress.

"Frightened! no, surely," replied Napoleon; "he knew he was surrounded by his father's friends."—*Memoirs of the Duchess D'Abrantes.*

LIVINGSTON'S SYSTEM OF PENAL LAW IN THE STATE OF LOUISIANA.

CHAPTER IV.

THOMAS EDDY is a name well known in America; he was, indeed, the Howard of the new world, blessed, however, with a far larger portion of success than his predecessor in Europe. This was the man who prepared the way for Mr. Livingston's great work on "Reform and Prison Discipline;" and we promise ourselves the pleasure of shortly presenting to the public a brief memoir of his interesting life. In the meantime, to prove the high value attached to Mr. Livingston's labours in America, we quote part of the biographer's dedication to him:—

"If," says the writer, "your 'Code of Penal Law,' 'Code of Procedure,' and of 'State Prison Discipline,' are not wholly adopted by any one state or people at once, (for old habits are hard to be subdued,) its benevolent spirit will shortly pervade the civilized world; and, at the present time, traces of it are to be discovered in the reforms which wisdom and charity are carrying on in this continent and in Europe. No man more highly valued your labours than Thomas Eddy, whose life I have sketched. He rejoiced in every thing which ameliorated the condition of man; I have, therefore, by the licence of personal friendship, ventured to unite your names." With this introduction, we proceed to a review of the fourth grand division of Mr. Livingston's work—the "Code of Reform and Prison Discipline."

IV. The "Code of Reform and Prison Discipline contains those provisions without which the peculiar benefits anticipated from the whole system must be lost. Superseding, as we have seen it does, the use of penalties, on which reliance has heretofore been placed, its whole efficacy must depend on the manner in which confinement is made, to answer the ends of punishment. The place of confinement, therefore, its arrangements and interior regulation, and the

treatment and discipline to which prisoners are to be subjected when confined within it, form the natural divisions of this code.

The first book, accordingly, treats of places of confinement, their construction and officers. These places naturally divide themselves into the two great classes appropriated for the reception of persons charged with offences, and the punishment of convicted offenders. The former is called a "house of detention," the latter, a "penitentiary," or "school of reform," according to the age of the convict, and the character of his crime.
